The column weighs 4,000 lbs. and is shown in section and plan in Fig. 1. Owing to lack of suitable equipment, the casting was made in green sand; being moulded in a pit as shown in Fig. 2. The pattern had to be shored up from the sides of the pit previous to

FIG. 5. CONICAL SECTION OF FLASK AFTER DRAWING PATTERN.

the base being rammed to a height sufficient to prevent the top heavy pattern from falling sideways. The cost of production by this method was a serious matter while the resulting quality of the castings was indifferent.

A reduction of one third of the time spent on each casting was called for along with an improvement in quality at the heavy or root end of the pillar, these demands being successfully met by improved methods.

Referring to Fig. 3, the pattern was placed on the face board A, surrounded by section B of flask, which was rammed full after which conical section C

was placed in position and rammed up level with flange D, where a parting was made. The circular plate E, Fig 4 was then lowered to place, stamped down, and bolted to section C, after which cylindrical section F was placed over the root of the pattern, secured by bolts to plate E, rammed up and sur-

FIG. 6. DRAG PART ON LOWER END OF COLUMN.

mounted by drag plate G which was bolted in place.

The whole structure was now rolled over carefully into a pit about three feet deep formed by the removal of the sand in the flask, after which the parting on the top of the pattern was made in the usual way. A special circular sunk-barred cope was rammed up and removed for finishing after which the pattern was drawn to permit removal of the centre conical section of the flask as shown in Fig. 5, the plate E being still secured in place. Six belt sections H, Fig. 3, were now removed from the drag Fig. 6, which was given a coat of black wash and dried over night on the stove car, while the upper green sand portions of the mould were finished and faced off with plumbago.

The assembled mould ready for pouring is shown in section in Fig. 7, the method of pouring being indicated at J. K. while three risers L are placed around the flange to relieve the pressure developed in a mould of this design.

FIG. 7. COMPLETED MOULD READY FOR POURING.

Under previously existing conditions, two moulders took three days to each casting of this type, while with the equipment and methods described, a much superior article was produced in 15 hours, a saving of 50 per cent. instead of the 33 1-3 per cent. asked for.

## THE VALUE OF A NOTE-BOOK

By J. Edgar.

THE writer, in a somewhat long and varied experience in pattern shops and foundries, has met very few men who have kept a private note-book or taken notes of their work or the work going on around them. Even men who are keen on their craft, and in many cases who have acquired a sound, technical education, depend entirely on their memory. A good memory is as valuable to the foundryman as it is to most men, but there is no reason why the mind should be burdened with details that could be more accurately stored in a note-book. In class work, students are invariably impressed with the importance of making voluminous notes, and it seems even more important that notes should be taken on practical shop work, as it is always more easy to track abstract subjects through text books. Valuable trade hints passed on by old hands never in many cases see print, and are very apt to be forgotten in time. The apprentice—and the journeyman no less—should cultivate a habit of making notes.

It need not be a laborious business, nor need it occupy much time. It should not be allowed to stand until the end of the day's work, but should be done at the moment when the occasion arises. A small pocket note-book into which can be jotted the many little tit-bits of a day's work is sufficient, although the more painstaking man will rewrite them carefully and collate them later. If it is not possible to get particulars of other work which is being done in the shop, observation will show many methods which cannot be hidden.

### Pattern Shop and Foundry Notes

The noting of hints is not all that ought to be done. The patternmaker should make a sketch of each job he finishes, stating whether it is a one-off pattern, a good skeleton, or a solid pattern, and underneath should be noted the cubic measurement of the timber used and the number of hours he has been on the job. In the foundry similar particulars should be noted, say, whether the job has been made in green or dry sand, or in loam from boards, and the weight of the casting. The patternmaker in this respect has a decided pull over the moulder, for he can watch the job from the beginning, and usually having access to the foundry he can compute the total cost of the casting more nearly.

### Technical Journal Cuttings

Akin to notetaking is the practice of keeping cuttings from technical journals. Space or other considerations may prevent the student or craftsmen from binding these journals, but if he is wise he will file articles which convey useful information for use at some future date. It is surprising the amount of knowledge

we allow to wantonly slip from us in quite a short time, and this practice of gathering information will not only be found invaluable to the mechanic while he is such, but, if he aspires to a foremanship and succeeds, he will find it even more valuable.

It is the custom with many firms nowadays, especially with patternmaking, to get quotations from outside firms against which their own foremen have to compete. The foreman is then in a somewhat similar position to the rate fixer in a premium bonus shop. He has to refer to similar jobs which have been made in the past, giving the cost of labor and material. Shop management expenses can be added. It is when placed in this position that a young foreman appreciates his note-books. It also gives him confidence in dealing with men, and a better understanding of what a reasonable day's work is.—Foundry Trade Journal.

## ARMSTRONG, WHITWORTH, OF CANADA STEEL PRODUCTS

THE very great importance attached to high-speed steel as a result of the development of munition manufacture impart peculiar interest to the fact that this material is now "Made in Canada." The fact that it is produced by Armstrong, Whitworth is sufficient guarantee that it will measure up to requirements, and if visible evidence is necessary, the interested visitor may inspect samples of work done by it at the leading munitions plants of this country. The proportions and color of the cuttings, which might be termed chunks rather than chips, will convince the practical inquirer without any further argument. A manufacturing department has been established at the works at Longueuil, Que., equipped in the most modern manner, which enables the firm to offer a range of miscellaneous shop tools heretofore not made in Canada. Numerous samples of milling cutters, inserted tooth saws, worm hobs, gauges, etc., made of the company's high-speed and carbon steel were tastefully displayed at the Canadian National Exhibition. Other products of the plant include electric furnace steel in all grades of carbon and alloy, locomotive and car wheel tires, rolled steel wheels and heavy forgings to specifications.

THE PRESIDENT of the Board of Trade has appointed a Committee to consider the best means of meeting the needs of British firms after the war with regard to financial facilities for trade, particularly with reference to the financing of large overseas contracts; the committee will prepare a detailed scheme for that purpose.

# CONTEMPORARY WAR ARTICLES

Embracing Information and Data Drawn from a Variety of Sources Relative to and Arising from the Prosecution of this Many-Sided European War

## BRITISH AND FRENCH MUNITIONS OUTPUT

**I**N the course of a long and exhaustive speech in the British House of Commons recently, by the Hon. Mr. Montagu, Imperial Minister of Munitions, much interesting and highly informative data relative to the produc-

Rifles.—Nearly three times as many new rifles were accepted in the first year of the Ministry of Munitions' activities as in 1914-15. The equipment of our army now overseas, both in machine guns and in rifles, has been accomplished from home sources alone.

Small-Arms Ammunition.—The home

have also supplied a large quantity of steel helmets and also some experimental body armour.

## Transport and Finance

The overseas transport of munitions has reached 1,300,000 tons.

There are now ninety-five national munition factories, and one of them fills twice as much as Woolwich.

Last year the United States supplied 70 per cent. of light shells; this year we shall make our own.

American heavy shell supply was invaluable, but we hope, with Canada's help, to be independent of it.

The finance department of the Ministry of Munitions controls an expenditure of \$5,000,000 a day. Its supervision has saved \$100,000,000 a year on shells; it has reduced American contract prices by 15 per cent.

Forty-five thousand soldiers have been recalled for munition work.

A year ago 1,635,000 persons were employed; to-day there are 2,250,000, and of these 400,000 are women.

## French Output

Since the beginning of August, 1914, the following increases in the manufacture of guns and shells have been secured in France:—

Machine Guns.—At the end of March, 1916, the production was 98½ times greater; at the beginning of June 131½ times; and a month later over 136½ times.

Guns.—The output of 75 mm. guns is

ARMSTRONG, WHITWORTH SHOWED SAMPLES OF WORK DONE BY THEIR HIGH-SPEED STEEL ALONG WITH SPECIMENS OF SMALL TOOLS, CUTTERS, ETC., CANADIAN NATIONAL EXHIBITION.

tion of war supplies in Great Britain was made publicly available. The following statistical synopsis will be found to embody the more important features discussed:—

## British Output

Shells.—An output which in 1914-15 took twelve whole months to produce is now attained in Great Britain in the following periods:—18-pounder ammunition, 3 weeks; field howitzer ammunition, 2 weeks; medium-sized shell, 11 days; heavy shell, 4 days; or, lumping all natures of gun and howitzer ammunition together, we are now manufacturing and issuing to France every week about as much as the whole pre-war stock of land service ammunition in the country.

Artillery.—Our present monthly output of big guns is about twice as many as were in existence for land service when the Ministry of Munitions started. The monthly output of heavy guns increased more than six-fold between June, 1915, and June, 1916, and will soon be nearly doubled.

Machine Guns.—The weekly output has increased, since the Ministry of Munitions was founded, fourteen-fold, and is still increasing. Soon we will have overtaken all the requirements of the British Army, and will then be able to turn our manufacture exclusively to supply our Allies.

production is now three times as much a week as a year ago. We meet all demands made by the War Office, and yet have built up a stock for the future.

High Explosives.—The production is now 66 times as much as it was at the beginning of 1915. The weekly consumption is between 11,000 and 12,000 times the amount required for land service ammunition manufactured in September, 1914.

OXY-ACETYLENE WELDING MACHINES, APPARATUS AND SUPPLIES EXHIBITED BY CARTER WELDING CO. AT CANADIAN NATIONAL EXHIBITION.

Weapons for Trench Warfare.—The output of bombs increased 33-fold between May, 1915, and May, 1916. We

27 times, and of 75 mm. gun carriages, 91½ times greater.

Heavy Guns.—Progress has been made

in the manufacture of heavy guns, which is certainly not inferior to that of "75's," and new models are in process of production from which great results are expected.

**Rifles.**—At the end of March, 1916, the output was 237 times greater; at the beginning of June, 267½ times, and a month later 290 times.

tion, to both of whom the shortage of merchant tonnage has become a serious problem.

For two years now, says the Liverpool Journal of Commerce, leading shipbuilders and marine engineers have devoted the best of their energies to naval work, the urgency and pressure of which would brook no delay, and as a conse-

effort is that the British Navy has been strengthened beyond all comparison, and is evidently regarded as now so supreme that the Admiralty is able to relax the pressure and free many of the yards to proceed with the construction of much needed merchant shipping. This is the change which has been inaugurated and, in the interests of our carrying trade, it has come none too soon. The output of mercantile tonnage has suffered severely during the concentration on naval work, and war losses at sea, as everybody knows, have been heavy. There is imperative need to hurry forward the production of cargo-carrying vessels. This is now to be done; is, indeed, already being done in many yards, and we may look for a steady increase in tonnage output during the remainder of the year.

With four months to go, our yards in that time will give a good account of themselves, for their resources have been increased and reorganized during the war period to an extent that will enable them to produce at a quicker rate than formerly, while in addition to the new shipyard on the Wye, there are several important extensions of premises in hand at Belfast, on the Clyde, and on the North-East Coast, all which will mean increased output in the near future. Moreover, a marked tendency is observed among shipowners to order duplicate ships, often several duplicates, which must necessarily save time and facilitate rapid construction.

#### Pre-War Orders Still Unfilled.

There are vessels which were ordered in the later months of 1914—i.e., just before and after the outbreak of the war—which have yet to be completed. These are making progress and will be launched very soon, making the berths left vacant free for the keels of ships since contracted for. There has been much trouble in completing these pre-war contracts, for they were placed

quence, the construction of merchant ships has been relegated very much to the background. The output of naval work by private yards has as a result been magnificent. We shall not know its full extent until the war is over, but we know already that it has called forth all the best forces of adaptability and organisation of which the industry is capable, and has involved an amount of strain on employers and employees alike that has been willingly, even cheerfully borne to the credit of all concerned.

#### Partial Release from Naval Work.

The net result of this great national

SPECIMENS OF WORK DONE BY VARIOUS FIRMS WITH THEIR EQUIPMENT WERE A FEATURE OF L'AIR LIQUID SOCIETY'S EXHIBIT.

**Shells.**—The manufacture of empty 75 mm. shells was 35 times greater in March and 38½ times at the beginning of July; of empty shells of greater calibres 54½ times and 79 times greater. At the present the output of these shells is 80 times larger than it was at the beginning of the war.

#### BRITISH MERCANTILE SHIP-BUILDING.

THERE are indications that the British shipbuilding situation is undergoing a change which will be very welcome not only to shipowners, but also to the na-

EXHIBIT OF THE GARLOCK-WALKER MACHINERY CO., CONSISTING OF SPECIAL WOODWORKING MACHINES AND SHELL LATHES AT CANADIAN NATIONAL EXHIBITION

originally at low prices, and the cost of turning out the ships with labour and materials at their present inflated values meant a serious loss to the builders and constituted a problem which required mutual good-will and agreement on the part alike of builders and owners to solve. Happily, in the main, it has been solved, chiefly by concessions on the part of the owners, most of whom were only too glad to see delivery of their ships in sight, even at augmented cost.

All new contracts placed during the last two years and particularly during the past twelve months, were naturally at very high prices—up to \$100 a ton for large cargo carriers and considerably more for smaller vessels—but these figures extravagant as they are, have not prevented owners from ordering ships, and, as a matter of fact, more orders have been offered to builders than they could accept. Many recent contracts, however, could only be placed on an actual cost plus a percentage for profit basis and it is highly probable that these will work out to a price per ton still higher than indicated. In some cases where several ships have been ordered by one firm, the prices are regulated on a descending scale according to the date—one might almost say according to year of delivery, for most shipbuilders have already two years work on hand, and few yards can entertain further orders for delivery before the end of 1918.

#### Long Continued Activity Assured.

It emerges, therefore, that pronounced activity in the shipbuilding trade is already assured for two years to come, but with falling prices after the war is over, and so much leeway in construction to make good, it may be assumed that the period of activity will be much longer than two years, probably nearer five. If capital and labour can agree, the outlook is excellent.

There has been, and still is, considerable difficulty in getting engines for the ships turned out. All the marine engineers practically without exception, have been assisting the Government by turning out munitions of one sort or another, and the pressure of this work has forced private contracts far into arrears. Ships already launched are still waiting, and likely to wait, for their machinery before they can be completed, and until the "shops" are freed from munition work, which cannot be just yet, the delay in turning out engines must retard the completion of contracts in the shipbuilding trade. There are known to be large firms of engineers and shipbuilders who are willing to build hulls, but cannot undertake to deliver the machinery for them, and in authenticated instances the engines have had

to be arranged for elsewhere. Time of course, will settle this difficulty, but not before the demand for munitions begins to slacken—a contingency which naturally depends upon the progress of the war.

The point to note meanwhile is, that the process of returning to normal conditions is under way. It may prove tedious, but it has begun, and, properly viewed, may be considered a great industrial achievement after the tremendous dislocation caused by the war.

### BRITAIN'S MUNITIONS ENGINEERING

THE story told the British House of Commons a few days ago concerning a year's work of the Ministry of Munitions is one that will forever live, and one that should be enshrined as completely in the country's engineering records as in its history books, says the technical correspondent of the Daily Telegraph. It touches the very vitals of everything that is of interest, fundamental and otherwise, to the engineer; and were that story other than one succession of astounding records of engineering achievements, such as have been made during the past twelve months, it is safe to say that another story—that of the triumph of the Hun—would have had to be told.

The mobilization of the machinery of Britain and America saved the world from horrors unimaginable. It enabled incredible increases in our munitions supply to be made with equally unbelievable rapidity—to the fatal undoing of Prussian plans. Whereas a year ago we were so short of munitions that we ran an "appalling danger" of the Germans breaking through, now we have actually a superfluity of certain classes of field guns, and soon shall have not only heavy shells "quite adequate for the enormous increase in guns of the larger calibre, but be able to spare a very considerable quantity of both shells and guns for our Allies"—to quote the words of the War Minister himself.

It is in the class of ammunition where the increase is the most difficult—that is, heavy shells—that the greatest increase of all has been made. Whereas the average weekly production of heavy shells in 1915-16 was twenty-two times as great as in the previous year, it is now ninety-four times as great!

#### Big Gun Production

How to provide the big guns to consume these shells—guns that, providentially, Mr. Lloyd George ordered on his own initiative in larger quantities than the military authorities thought necessary—was a great problem, owing to the fact that a year or so ago the navy required all the big gun plant that was available. To get over this difficulty new

buildings with an area of 1,000,000 square feet, were erected and equipped with 2,500 special machines. As a result, we are now turning out in a month nearly twice as many big guns for land service as we were in the year before the Ministry of Munitions was formed—and that while half the engineering capacity of the country has been engaged entirely on work for the navy!

It is on these huge pieces of ordnance—undreamed of before the present cataclysm burst upon the world—that we have to depend, ultimately, for getting the Germans out of their defensive works. The new guns represent the quintessence of British engineering skill. They have acquitted themselves admirably in the recent fighting, and have won the unstinted admiration of the technical experts at the French Ministry of Munitions. The fact that not one of these monsters was in existence a year ago is all in our favor. It means that they embody the very latest improvements in design and material, whereas a considerable proportion of the German big guns are comparatively "old stock," having been made before the war at a time when the data now available were necessarily non-existent. This fact enables us to account for the superiority, for instance, of the British 16-in. gun over enemy artillery having a much greater calibre.

The information given by Mr. Montagu relative to the national shell factories must have been very surprising to the general public. Apart from the eighteen filling factories there are twelve factories for the production of large shells. These factories, which cover seventy acres, have fifteen miles of bays, 10,000 machine tools, seventeen miles of shafting, 25,000 horse-power, and a daily output that would fill a train a mile long! No wonder it is hoped before long to do without American shells altogether. It has been estimated that the saving should be sufficient soon to pay for the shell factories and their equipment.

#### A National Machine Tool Factory

One of the national factories, it is specially interesting to note, is devoted entirely to the production of machine tools. Practically every weapon used in the war has been fashioned with the aid of a machine tool, but, unfortunately, the greater proportion of these tools is of foreign origin. During the war it has been necessary to secure scores of thousands of machine tools in order to enable the munitions output of the Allies first to approach, and then to surpass, that of the enemy. Millions and millions of pounds' worth of machine tools have been bought in America during the war period to ensure adequate supplies of munitions from our factories—national and otherwise. It would have

(Continued on page 295.)

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## NEW DESIGN COMPRESSED AIR CHUCK.

ONE of the many difficulties that manufacturers have had to contend with in the making of munitions has been the lack of suitable facilities for holding the shell securely while the machining operations were being performed. In an effort to increase production, or produce on a more economic basis, many more or less novel and useful devices have been designed and constructed. The chief drawback to the majority of these devices has been their inability to obtain sufficient gripping power on the shell to prevent it turning in the chuck, when excessive pressure was placed upon the cutting tools.

The accompanying illustrations show a single unit combination pneumatic chuck, recently designed by A. J. Lavoie of Montreal, which has been the means of greatly increasing the efficiency of operation and rate of shell production. The chuck is self-contained, very rigid, simple in construction and can be attached to any make of lathe with little loss of time in the operation of the machine. Instead of the cylinder being

play in the operating mechanism. The cylinder of the device is secured to the face plate of the lathe; or if desired, can be screwed directly to lathe spindle,

pieces that control the operation of the cast steel gripping jaws, these being made in sections, suitable to the diameter of the work, the 6 inch size having

CHUCK USED ON A YEATES LATHE. CYLINDER SECURED TO MAIN GEAR OF LATHE.

CHUCK ATTACHED TO BULLARD LATHE.

located at the outer end of the headstock, the air chamber is contained in the body of the chuck, thus reducing to a minimum the possibility of spring or

as shown at A. The piston has a stroke of about  $\frac{1}{4}$  inch, and is so designed that only one packing is required. Secured to this movable piston are the wedge

six in the set. By means of a flange one inch thick, operating in a groove in the outer diameter of the steel jaws, lateral movement is eliminated, and no sliding action takes place on the surface of the shell, when the chuck is being operated.

The adjustable stops, for gauging the position of the work, are screwed into a spider C located between the two outer portions A and B, of the chuck body. These spiders which receive the thrust as the shells are being placed in position are steel castings and can be of any desired form to meet the special requirements of the work. A noteworthy feature in connection with this arrangement is the entire elimination of all lateral motion, either in the stops, shells or gripping jaws, while the chuck is in action. The design of the chuck is such that the gauging of the shells can be accomplished from either the inner or outer surfaces. A number of coil springs are utilized to return the piston and operating wedges to the released position when the pressure of air is removed; the gripping jaws being forced back by two one inch flat springs located in recesses on the inner diameter. The jaws have an extra long bearing surface both on the shell and the taper portion.

The main steady-head D which supports the outer portion of the chuck is of extra heavy design and is made in various styles and sizes to suit the

wheel lathe, illustrated in Figs. 1 and 2 and built by the Niles Bement Pond Co., at Hamilton, O. All of the well known time and labor saving devices

as the elimination of all end thrusts and the smoothness of operation due to the helical form of teeth employed.

The method of inserting the work in the driving spool is indicated in Fig. 2, where the spool and gear are in position to receive a pair of wheels which are rolled along elevated rails not shown. The driving gear has a hinged segment which automatically closes and locks as the wheels are rolled into the lathe, and unlocks and opens as they are rolled out, no manipulation of the segment by the workman being necessary. The opening in the spool is 10 in., which takes axles up to 9½ in. dia., with inside journals. The largest M.C.B. axles with outside journals up to 6½ in. dia., are also accommodated.

The wheels are brought up to the centre of the tailstocks by an elevating device driven by a 5 horse-power constant speed motor, and are centered by tailstocks which are moved on and clamped to the bed by powerful air cylinders. The tailstocks are under perfect control by means of air valves within easy reach of the operator.

For wheels on axles with outside journals there are furnished collapsible bushings which fit over the journals and are tapered to fit the tailstock spindle; this method ensures the treads of the wheels being concentric with the journals. Four sets of these bushings are supplied for different sizes of journals, while for wheels on axles with inside journals, centres are furnished for centering the ends of the axle.

Each face-plate of the driving spool is equipped with three Sure-Grip drivers, which engage the inside of the wheels near the circumference. The tailstock face-plates are provided with

swing of the lathe. All chucks are made on the duplicate system, the various parts being machined in special jigs, so that accurate alignment is always assured. Another feature of this chuck is the high efficiency maintained when operating on the low pressure system; 60 lbs. pressure being sufficient to meet the heaviest requirements. It can be placed on any machine; the only provision being a passage through the spindle for the inlet of air. The air box E, is attached to the feed pipe that passes through the spindle.

When the chuck is entirely assembled, it is placed on the lathe and the bearing portion of the outer case given a final skim. The heavy duty steady-head is then located on the lathe bed and habbitted in position, after which the jaws are locked by special liners, and with the pressure of air on the piston, the jaws are bored to the proper diameter. By using different sets of jaws, various sizes of shells can be handled in the one chuck. The steady-rest is supplied with a self-oiling arrangement, that insures a well lubricated bearing at all times.

Designs are now under way for incorporating this pneumatic chuck into the head-stock of a special lathe. These chucks are being placed on the market by the Montreal General Tool Co., Montreal, P.Q.

#### CENTRE DRIVE CAR WHEEL LATHE.

Several improved features have been incorporated in the centre drive car

which have been evolved in previous models are retained.

Motor drive is provided from a 50 horse power A. C. motor of the usual type, the final drive to each wheel being through two face plates mounted on the ends of the driving spool or spindle which revolves in large bearings on the central part of the bed and is driven by a large steel herringbone driving gear, which, along with its casing, is a prominent feature of the design. The pinion which drives this gear is located in the lower part of the bed on the front or operating side, Fig. 1; the pinion shaft

extending along the side of the bed to the motor drive gearing as shown.

For transmitting heavy torque as required in this class of work, the herringbone gear offers several advantages such

independent chuck jaws which engage the outside of the wheels and support them against the thrust of the drivers. The wheels are thus held with absolute rigidity; the tendency to chatter is eli-

CHUCK ATTACHED TO HEPBURN LATHE. CYLINDER SCREWED DIRECT TO SPINDLE.

FIG. 1. OPERATING SIDE OF WHEEL LATHE SHOWING PNEUMATIC TOOL CLAMPS AND CENTRAL LUBRICATING SYSTEM.

minated and the axles are relieved of all deflecting or torsional strains.

Pneumatic tool clamps are provided on the tool rests, see Fig. 1, which enable the operator to change and clamp the tools in a few seconds without the use of a wrench. These clamps have been a most important factor in the great reduction in time and labor of wheel turning. The tools are clamped by means of a wedge action operated by a pneumatic cylinder in the body of the tool rest. The clamping bar swivels against a heavy wing nut on a stud carried by the tool rest, the end opposite the tool having a roller which contacts with a wedge block on the piston rod, a similar roller mounted on an extension of the tool rest supporting the reaction from the clamping bar.

The tool slides have in and out adjustment for setting depths of cuts and also hand longitudinal traverse. Ball thrust bearings are fitted to the tool slide screws, and the rests can be swivelled to provide for the taper of the wheel treads.

Power feed is obtained by direct gearing and is positive in action, the range being from  $\frac{1}{8}$  in. to  $\frac{1}{2}$  in. per rev. of the faceplates.

All driving gears are steel and are fully enclosed. The driving spool is fitted with guards and wipers to prevent chips and dirt from getting into the bearings, wipers being also attached to the tailstocks to keep the tracks free from chips and dirt. Suitable shields protect the tool slides.

When direct current is used, a variable speed motor with 3 to 1 variation and dynamic breaking is employed.

The lathe will turn wheels from 26

## BRITAIN'S MUNITIONS ENGINEERING

(Continued from page 292.)

been a very grave matter if Britain and her Allies had been unable to secure these supplies from America.

Without imported machine tools we could not have thought of winning the war. Our own facilities for producing these machines were totally inadequate at the commencement of hostilities. The British machine tool trade was being steadily squeezed out by German and American competition. We exported in the year before the war less than \$3,750,000 worth of machine tools, as compared with Germany's export of over \$15,000,000 worth in 1913. The greater proportion of the machine tools in our factories is of foreign origin. This must not and cannot continue. The war has at least pointed out the urgent necessity for an awakening to the need for different methods and greater co-operation among manufacturers, in order to secure for Great Britain after the war a better share of the machine-tool trade—and there are many other branches of the engineering industry to which this applies with equal force.

In the case of such a "key" industry as that of machine tools—the indispensable basis of all engineer-manufactures, from a tin-tack to a battleship—we simply must aim at becoming self-supporting. Only by succeeding in this aim can we assure ourselves of ascendancy in days to come—both in the warfare of commerce and, if needs be, on the battlefield.

### Munition Workers' Holiday

Turning, in conclusion, to a brief con-

also the central staff of 5,000 of the Ministry of Munitions and a departmental administrative staff of 30,000, including 14,000 women. Of the two and a quarter million workers, the majority are employed on machine tools, to which they came without any previous engineering training. After the war their experience should be invaluable in connection with the trade war in which we shall then be involved.

At the present time, however, our munition workers have no thought for the future—their only object is to "deliver the goods," and so to speed the coming of peace. They have worked splendidly without a break since Easter, and it is, therefore, good news that it has been found practicable to allow a rest period from Sept. 15-19 for these workers. It has been calculated that as a result of the holiday the physical efficiency of the workers will be so increased as to make it likely that the resulting loss in output will soon be made good.

Besides, the machines will have their efficiency increased, too. Many munitions plants are being worked dangerously near the limit of safety, and the long week-end will enable boilers, flues, power plant, shafting, machines, lighting, ventilation, and other equipment to be overhauled in a manner that would be impossible if holidays were taken in relays.

MOST of the packings used in England for steam jointings have been in the past made abroad, and in consequence of the difficulty of obtaining supplies, several British firms have been endeavouring to make in that country packings of equally good quality. The chief difficulty has been to obtain packings which can be used for joints in superheated steam pipes. Several samples have been tested in the apparatus for testing the blowing-out pressure of joints at the National Physical Laboratory, and according to the report of that institution, the makers have been so far successful in producing joint rings varying from 1-32-in. to  $\frac{1}{8}$ -in. in thickness which will stand a pressure of 250 lb. per square inch at a temperature of 1000 deg. Fah. to 1100 deg. Fah., without any signs of breaking down.

DURING a recent visit by representatives of the Dominion Parliaments to the East Hecla Works of Hadfields, Ltd., at Sheffield, Sir Robert Hadfield stated that no firm had made more use of science than Hadfields, and Germany had copied many of their achievements. He deplored the lack of appreciation of science by the State, and asserted that there is nothing our enemies can do that Britons could not do better.

FIG. 2. REAR SIDE OF LATHE, SHOWING DRIVING WHEEL SEGMENT OPENED TO RECEIVE A PAIR OF WHEELS.

in. to 42 in. dia. on the tread, with a maximum distance between centres of 94 in. Floor space occupied—length, 20 ft. 6 in.; width, 10 ft. 2 in.; height, 6 ft. 6 in.

sideration of the personnel that has wrought such a change in Britain's munitions output, we find that it numbers the tremendous total of 2,250,000, of whom 400,000 are women; there is

### THE QUEBEC BRIDGE TRAGEDY

**I**F we might so express it, misfortune appears to dog the effort to bring to completion the work of spanning the St. Lawrence River by what is known as the Quebec Bridge. In spite of the elaborate arrangements made and the most carefully and skilfully devised precautionary measures taken, to "make North and South Shore ends meet," disaster supervened, with the result that the centre span or that piece which would have joined shore to shore now lies at the river bottom. As we go to press only the most meagre details of the tragic occurrence are available, therefore exactly what occurred may be said to be more or less problematical. This much may be said, however, regarding the method of procedure adopted—ultimate successful accomplishment of the object in view had begun to demonstrate itself ere misfortune overtook the effort.

Just a week ago we were privileged to present to our readers a specially detailed statement together with illustrations covering the bridge generally, and the centre span raising operation specifically. To those who took the trouble to read the article intelligently, it could not be otherwise than borne in upon them that every untoward contingency that high-grade human skill and inventive genius was capable of foreseeing and meeting had been amply provided for. Criticism of the method of "making ends meet," there may have been, nevertheless sufficient demonstration was made before the collapse came to justify successful attainment in the manner chosen.

The calamity comes home to us with a much more direct keenness than did that which befel the predecessor of the present structure some nine years ago, being, if we might so say, just a trifle more national in its application. The loss of life fortunately is less than might have been expected, although to those to whom bereavement has come, the burden of the disaster is thereby not less lightened. To others again, escape with life has perhaps meant more or less serious injury. To the bridge engineers, the contractors and their operative staffs most closely allied with the work of planning a successful issue to the whole big undertaking, and on whose shoulders the great task bore still more heavily as September 11, 1916 approached, a measure of sympathy equally large with the bereaved and the injured seems unstintingly due. The disappointment, although a national one, will operate most severely within

the individually circumscribed area referred to above, the intense anxiety of recent weeks and days accentuating its tragic side.

Just what effect the disaster will have on the navigation of the St. Lawrence between Montreal, Quebec and the sea is not yet determined, although it doubtless will suspend such traffic for the time being at least. The menace to navigation, if such there be, will be removed with the least possible delay after investigation has been made of a clue to the disaster and a line of action determined upon relative to the sunken and wrecked span. The raising or removal of the latter will be subjects for consideration, and, incidental to either, a new method of "making ends meet" may be developed. Monday's abrupt interference with the closing of the gap will postpone by a good many months both the latter eventuality and the subsequent official opening to traffic of the completed structure. Realizing the onerous nature of the task, the tremendousness of the risks involved, and the unexpected and unfortunate outcome of the present proceedings, may it not be possible to fill the breach by building the centre span in place, either whole or part?

### BRITAIN'S WAR ENGINEERING ACHIEVEMENT

**I**F it is impossible, even from the most cursory perusal of the data embodied in the recent speech in the British Parliament by the Minister of Munitions—a synopsis of which appears in this issue, to feel otherwise than satisfied, not only with accomplishment to date as regards variety, type, quality and quantity of our munitions production and its contributory accessories, but to be disposed to look forward to continuous and still greater achievement as each succeeding day unfolds itself. The comparisons made—whether these be taken from a peacetime establishment point of view or from the period covering the early months of the conflict, bear an almost miraculous interpretation in the light of the knowledge now available. Not only is a master hand apparent in the mobilization, in the first instance, of our industrial resources, and more particularly those relating directly to engineering and metalworking, but the latter themselves in the spheres of management and operative skill have mobilized in no less degree a creative genius, and have given same a practical exemplification without parallel perhaps as to either time or place industrially.

Since the data referred to became public property, a clearer vision of the ultimate outcome of the struggle has been secured, and not only so, but an added inspiration has been given our people to persist in their meantime war-directed effort. It is also gratifying to note that our Ally, France, is in the same happy position as ourselves as regards munitions output, and that in her case too, the limit of achievement is still being extended. Side by side with our munitions production, may be placed that of our warship building and fleet maintenance, in which latter respects it may be said that we are even more comfortably circumstanced. Just what our naval strength is now is more or less of a profound secret, however, we know that peace time or early war month comparisons are equally disproportionate with those of munitions production. Although our fleet strength has been procured at what may be termed the expense of our merchant shipbuilding, evidences now point to a relaxation regarding the former, and to a transfer of energy and effort to the latter. That conditions are such as to warrant this step is particularly gratifying, anticipations being that the closing months of the present year are likely to see material increases in our shipyard outputs that will offset in large degree the meagre tonnage of the earlier months.

## INDUSTRIAL NOTABILITIES

**C**LIFTON W. SHERMAN, president, Dominion Steel Foundry Co., was born at Scroom Lake, Essex County, New York, Aug. 25, 1872, the son of Z. C. Sherman. He was educated in the Public Schools, taking the Academy Course at Crown Point, New York. Since entering upon a business career, he has been chemist and metallurgist, Illinois Steel Co., and Griffin Wheel Co., Chicago; general manager in the foundry of the Pressed Steel Car Co., including Pennsylvania Car Wheel Co., Malleable Co., and Central Car

CLIFTON W. SHERMAN.

Wheel Co., Pittsburg; general manager and director for eight years of Pratt & Letchworth Co., Buffalo, N.Y. He organized and financed the Dominion Steel Foundry Co., Hamilton, becoming president in 1912.

Mr. Sherman married Ella Wingert, daughter of C. O. Wingert, the family consisting of one daughter. His clubs are the Buffalo and Park, Buffalo; Hamilton; Railroad (New York); Engineers (Montreal). His society, the 32° Scottish Rite, and his recreations, motoring and golf. In religion he is Presbyterian. His residence is at 35 Proctor Boulevard, Hamilton, Ont.

flects the abnormal demand for this class of material, and also the inability of consumers to cover their requirements. Indications point to a firmer tone in the sheet situation, the export inquiry for galvanized sheets having been quite heavy of late. Blue annealed is not so active, and deliveries are easier. The cooler weather has added considerably to the output of all steel mills. Wire and wire products are showing improvement, and the demand is becoming heavier. Wrought iron pipe and boiler tubes are still in good demand, but prices are generally firm.

**Metals**

The general condition of the metal market has shown no special features, and prices show little change. Copper is becoming stronger, as the result of an apparent shortage. Tin is at present dull, but otherwise steady. Spelter continues unsteady, with quotations uncertain. Lead is becoming steadier. Antimony is still weak.

**Copper.**—No special features have developed in the copper situation, although a scarcity of metal is apparent, with a corresponding stiffening of quotations. While the market has been fairly active, no large export buying has been reported. Some extensive inquiries are abroad, but actual contracts have not yet been closed. The future outlook appears very encouraging, and a firm tone is everywhere evident. Production has suffered to some extent owing to the labor troubles prevailing among the employees of some of the large refineries; and, coupled with this, is the inability of the refineries to handle the entire output of the smelters. Facilities for increased refining are under way, but several months must elapse before their operation can have any effect upon present conditions. Producers are believed to be well sold up for the remainder of the year, and the general situation is showing a strong undertone. The London market is steady, with slight advances, corresponding to a ¼¢ rise. New York is quoting an advance of ¼¢ on lake and castings, and ⅓¢ on electrolytic; quotations being 27¾¢, 25½¢ and 28½¢ respectively. Local dealers, while reporting a strong and fairly active market, are holding firm on quotations of 31¢ for lake and electrolytic, and 30¢ for castings.

**Tin.**—The unsteady position of tin continues to keep this metal in a dull condition. The inactivity of the past few weeks is causing some uneasiness throughout the trade, and prices are inclined to become easier; but while slight declines may be reported, it is not expected that any serious falling off will be shown, as tin is conceded to be one of the firmest of metals. However, war conditions make it impossible to predict the future, and buyers should always be prepared for the unexpected. While no early advance is expected, it is thought

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

**Montreal, Sept. 11, 1916.**—Industrial affairs, which had become somewhat unsettled, owing to the labor situation on the other side of the border, are gradually assuming normal conditions. The activity in all lines of manufacture continues to reflect the prosperous condition of the country, and the outlook for the coming winter appears to be satisfactory. The unexpected calamity of the collapse of the Quebec Bridge has cast a temporary gloom over the country, as the successful completion of this undertaking has been looked forward to for many months. Favorable crop reports continue to come in and prospects for a normal yield are very encouraging.

**Steel**

The production end of the steel business continues to tax the facilities of producers; the domestic needs, in many respects, having to suffer for the more urgent necessities of war demands, which are as imperative as ever. The inability of many manufacturers to obtain the required raw material has resulted in some plants being forced to curtail their output. While no price changes are noted for the week, there appears a possibility of advances shortly. A steadier tone is shown in bars and plates, especially in sheet bars for the heavier and wider sizes of plates which are in great demand. The inquiry for ship plates re-

that a stronger tone will develop after a short period of inactivity. The London market has declined slightly, and is at present quiet. Following the recent spell of inactivity, the New York market has declined  $\frac{1}{4}$ c, the nominal quotation being  $38\frac{5}{8}$ c per pound. The local situation is quiet, with prices unchanged at 44c per pound.

**Spelter.**—Early in the week the market was looking forward to a further decline in spelter, but recent advices state that the situation is stronger owing to the fact that prices have been advanced on the London market. The apparent return to a stronger position is, however, not due to the activity of the market, but quotations have been lately affected by the lack of shipping facilities at the present time and the increase of ocean freight rates. The demand is still below the supply, and the market is expected to remain weak for some time. London prices have been fluctuating during the past week, and New York prices have been unsteady, advancing  $\frac{1}{4}$ c, putting the present nominal quotation at a shade over 9c per pound. Local dealers report a very quiet market, with prices lower; the quotation of 13c being a decline of 1c per pound.

**Lead.**—The market generally is showing a strong tone, and the demand, both domestic and export, has shown improvement. Rumors are current that the Trust price is likely to become stronger, as producers are apparently well supplied with future orders, and the visible supply for early consumption is on the decrease. However, the London market, and also the American independents, are inclined to show a weak undertone, with slight declines in prices. It is nevertheless expected that a stronger market will shortly be reported. Dealers here are

holding firm on a quiet market, quoting last week's price of  $8\frac{3}{4}$ c per pound.

**Antimony.**—In spite of the weakness still shown in antimony, some dealers refuse to dispose of metal at concessions on quoted prices; and this gives rise to the belief that some strength is still left in the market. The New York market has declined  $\frac{1}{2}$ c during the week, the current nominal quotation being 12c per pound. Local dealers report a dull market and a decline of 1c on the week; quotation being 16c per pound.

#### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

#### Machine Tools and Supplies

No developments have taken place in the tool situation, which is gradually becoming normal. The demand for munition machinery is not so pressing as six months ago, and although orders are still being placed for individual tools, the bulk of the machinery has now been ordered. Deliveries are almost normal and conditions throughout the trade are much more settled, labor difficulties having greatly improved. The volume of second-hand machine tools for sale is very large, which is having the effect of reducing the prices recently obtained for certain

kinds of special tools. The requirements of the trade continue to place a heavy demand on all classes of tool supplies, and the raw material situation in some respects is having the effect of advancing quotations on some lines.

#### Scrap

The situation in the scrap iron and steel market is very strong, and American quotations show a  $\frac{1}{2}$ c advance on heavy melting steel scrap and old steel rails. Old metals have shown considerable activity, and prices on the light brass scraps show a slight advance. Heavy brasses and scrap zines are slightly weaker. Dealers here report an active market, but prices are generally firm. Steel axles are quoted at  $15\frac{1}{2}$ c, being 1c stronger than last week.

**Toronto, Ont., Sept. 12.**—Industrial conditions continue very favorable, and the volume of business is steadily increasing. The shortage of labor, however, is becoming more serious, as it is interfering with production. The shortage of raw materials is also becoming more acute, and is a serious handicap to manufacturers who are thus forced to advance their prices.

#### Steel

Unusual strength characterizes the steel market, and the situation is getting tighter, with deliveries slower and prices advancing. All indications point to a continuance of present conditions for an indefinite period, as the demand for steel is increasing rather than decreasing, principally due to the war, but also on account of the steady improvement in industrial conditions and increase in the domestic demand. This latter feature promises to be an impor-

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

#### BRAZIL

Rio de Janeiro, British Consul General.

#### CHILE

Valparaiso, British Consul General.

#### COLOMBIA

Bogota, British Consul General.

#### ECUADOR

Quito, British Consul General.

#### EGYPT

Alexandria, British Consul General.

#### FRANCE

Havre, British Consul General.  
Marseilles, British Consul General.

#### INDIA

Calcutta, Director General of Commercial Intelligence.

#### ITALY

Genoa, British Consul General.  
Milan, British Consul.

#### MEXICO

Mexico, British Consul General.

#### NETHERLANDS

Amsterdam, British Consul.

#### PANAMA

Colon, British Consul.  
Panama, British Vice-Consul.

#### PERU

Lima, British Vice-Consul.

#### PORTUGAL

Lisbon, British Consul.

#### RUSSIA

Moscow, British Consul General.  
Petrograd, British Consul.  
Vladivostok, British Consul.  
Odessa, British Consul General.

#### SPAIN

Barcelona, British Consul General.  
Madrid, British Consul.

#### SWEEN

Stockholm, British Consul.

#### SWITZERLAND

Geneva, British Consul.

#### URUGUAY

Monte Video, British Vice-Consul.

#### VENEZUELA

Caracas, British Vice-Consul.

tant factor in the situation, as there are a number of building propositions, etc., being held up owing to the difficulty of obtaining material, which, when conditions become favorable, will be proceeded with. There is no relief in sight as regards the scarcity of steel and higher prices. Wrought iron pipe has been advanced; the new list has not been issued, but will be out in a day or so. Black pipe only is affected, as the lower price of spelter has made a change in galvanized pipe unlikely in the meantime. Higher prices on boiler tubes and plates are practically certain owing to the big demand and congested condition at the mills. The demand for plates is very heavy, particularly from shipyards and ear builders. Boiler and structural rivets have advanced 25c per 100 lbs.

The sheet market is fairly steady at firm prices. There is a heavier demand for special sheets than can be met for the delivery required. Blue annealed sheets are easier as to early deliveries, premiums now being relatively small. Although spelter continues weak, lower prices on galvanized sheets are unlikely in the meantime, as black sheets have a higher tendency and acids are still costly, while labor is also a factor to be considered.

In the United States the steel market is as strong as ever, due principally to the sold up condition of the mills. The situation in this respect is getting more acute and unfilled tonnage reports will no doubt show increases for each month this year. The export demand is still heavy, principally for shell steel and billets, but other products, such as rails, wire rods, bar wire, etc., show a heavy tonnage. The demand for steel bars is heavier, and the mills are practically sold up for the first half of 1917. An advance in sheet bars is expected for the fourth quarter.

#### Pig Iron

The situation in the pig iron market continues more or less as during the past few weeks. Quotations, however, are firmer, and an advance is very probable in the near future.

#### Scrap

The renewed activity in the copper market has affected scrap metal and prices have advanced practically 2c per pound. Brass and composition scrap has also advanced an equivalent amount. Steel rails are higher, as is also heavy melting steel. Scrap lead is unchanged, but zinc is a shade lower. The market locally is steady, with business good.

#### Machine Tools

The principal feature in this market is the steady demand for large swing lathes for machining the large calibre shells. Deliveries on this class of equipment are quite good, considering the de-

mand. Although there have been no increases in makers' prices recently of any consequence, the cost of all machine tools has risen considerably since the war started. Standard lathes, for instance, are now about 60 per cent. higher than they were before the war, while heavier equipment, such as cranes, have advanced almost 110 per cent. Quotations on the general run of machine tools are about 30 per cent. higher.

#### Supplies

While business is very brisk, it is becoming increasingly difficult to get many lines of machine shop supplies, especially steel and brass goods. Makers of milling cutters are sold up for approximately ten months, so heavy is the demand. Twist drills are also in big demand, as are also files; in the latter case there is a shortage reported. An advance in bolts and nuts of about 10 per cent. has been announced, while malleable bushings are also higher.

#### Metals

The feature of the metal markets is the continued strength of copper and the possibility of higher prices for this metal. The Allies are placing large orders in the States for copper, while the domestic demand is also heavier. In regard to the other metals, the situation is unchanged, and the markets are quiet. Business locally is very good.

**Copper.**—With producers practically sold up for this year and probably half of the production for the first six months of 1917 disposed of, it follows that the copper position is an exceptionally strong one. It is thus quite probable that higher prices may be looked for in the near future. Quotations are nominal and unchanged at 30c per pound.

**Tin.**—The market in New York is quiet, with a slightly easier tone, while London is also easier. Local quotations are unchanged at 44c per pound.

**Spelter.**—Prices declined during the week, but recovered, and the market is now firmer. The brass trades have been buying more spelter, and galvanizers are also taking fair quantities. Local quotations are unchanged at 14c per pound.

**Lead.**—Consumers are said to be well covered; the demand for lead in the meantime is consequently light. The "Trust" price of 6.50c New York is unchanged, and "Independents" are still a shade higher at 6.60c New York. Local price 8½c per pound.

**Antimony.**—The market is quiet and featureless, with quotations unchanged and nominal at 18c per pound.

**Aluminum.**—The situation in this market is unchanged, with nothing of importance to note. Quotations unchanged at 68c per pound.

## Trade Gossip

**The Deloro Mining & Reduction Co.,** Deloro, Ont., have transferred their business to the Deloro Smelting & Reduction Co.

**The Canadian Fairbanks-Morse Co.,** Toronto, have been awarded a contract for a 30 h.p. motor-driven vertical centrifugal pump by the Town Council of Palmerston, Ont.

**Toronto-Hamilton Highway.**—Hon. Finlay G. Macdormid, Minister of Public Works for Ontario, stated on Sept. 5 that the Toronto-Hamilton highway would be open for traffic in about three weeks.

**Commissioners End Tour of Britain.**—The Canadian Trade Commissioners, having finished their provincial tour of Great Britain, received most cordial receptions in the various cities they visited, and their movements received considerable attention from the newspapers.

**Wide Canadian Forests.**—Merchantable timber of Canada is distributed by millions of acres, as follows: Nova Scotia, 5; New Brunswick, 9; Quebec, 130; Ontario, 70; British Columbia, 100; Saskatchewan, 100. The grand total of forest area is 414,000,000 acres for the Dominion.

**H. E. Streeter,** formerly works manager of the Precision Tool & Machine Co., of Montreal, has severed his connection with this company, and has taken over the Canadian sales agency for Grankvist Drill Chuck Co. for the sale of "Johansson" standard gauge blocks and the "Johansson" adjustable limit snap gauges. An office has been opened at 504 McGill Building, Montreal.

**St. John, N.B.**—Much interest is being shown in the tungsten (wolfram) mine which is being developed at Burnt Hill, on the South-west Miramichi. George E. Howie, C.E., of Fredericton, has been appointed resident engineer. The Milton Hersey Co., of Montreal, and Mathew Lodge, of Moncton, are interested in the property.

**Britain Controls Synthetic Nitrate.**—Great Britain has purchased the entire supply of synthetic nitrate in Norway, thereby preventing exportation of this requisite in the manufacture of ammunition by Germany, according to a statement made at San Francisco, Cal., recently, by J. M. Humphreys, manager of a large British nitrate corporation, who was in that city en route to Chile. Mr. Humphreys stated that he plans to put into operation at the nitrate fields of his company in Chile a new process for extracting and elaborating nitrate that will cut the cost of production in half.

# INDUSTRIAL <sup>AND</sup> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News .

## Engineering

**St. John, N.B.**—The Governors of the General Hospital here contemplate building a laundry and power house.

**St. Thomas, Ont.**—The Monarch Knitting Co., will build an extension to the power plant and factory. T. O. Aked is the manager.

**Nelson, B.C.**—The West Kootenay Power & Light Co. will construct an 8,000-horsepower unit addition to its plant at Upper Bonnington Falls.

**Vancouver, B.C.**—Fire of unknown origin destroyed the buildings and plant of the Pacific Steel Products Co., in operation only five weeks, causing a loss estimated at \$150,000.

**Montreal, Que.**—President Chahoon of Laurentide Ltd., announced recently that by the middle of November the company's sulphite mill at Grand Mere would have its capacity increased 100 per cent.

**Redcliffe, Alta.**—The Redcliffe Rolling Mills is installing a new furnace at its plant which will double the present capacity. The company will also install machinery for the manufacture of bolts and nuts.

**Iroquois Falls, Ont.**—Plans for the enlargement of the capacity of the Abitibi Power & Paper Co., and financial arrangements for the extension of the plant have been completed, according to reports. The proposed extension will increase the company's output of newsprint to some 400 tons per day.

**Montreal, Que.**—The Atlas Construction Co., has been awarded a contract for the construction of a brick and reinforced concrete paper factory and power house for the Thompson Norris Co., 355 East Notre Dame street, Montreal. The plant will cost \$84,000. Lockwood & Greene, Boston Mass., are the architects.

**St. Thomas, Ont.**—The St. Thomas Construction Co., St. Catharines Street, suffered damage to the extent of about \$20,000, by a fire on Sept. 5. Among the items which make up the \$20,000 loss are included the furnaces, air compressors and a number of other valuable machines. The loss will be pretty well met by the insurance carried.

**Toronto, Ont.**—Plans have now been completed for the initial mill of the West

## CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

Dome Consolidated, and it is proposed to have the foundations for the mill and machinery completed this fall so that the other construction work can be carried on throughout the winter months. A start will also be made almost immediately on the new surface plant which is to be installed at the head of the main shaft.

## Electrical

**Kingston, Ont.**—It is reported that there is a proposition on foot to have the C.P.R. line from Kingston to Renfrew electrified, and that power will be secured from the Mississippi River to operate the road, and also meet the needs of Kingston and adjacent towns.

## General Industrial

**Granby, Que.**—The Elastic Web Co., may build a factory here.

**Hamilton, Ont.**—The Chipman & Halls Knitting Co., will build a factory here to cost about \$15,000.

**Regina, Sask.**—The Prairie Biscuit Co. is building a factory which it is expected will be in operation early in January next.

**Calgary, Alta.**—The Western Canada Flour Mill Co., propose to build an addition to their plant at an approximate cost of \$5,800.

**Brantford, Ont.**—The City Council have decided to grant a fixed assessment of \$3000 on the Hampel Paper Box Co. new factory.

**Toronto, Ont.**—H. Webb Co.'s factory on Buchanan St., was destroyed by fire on Sept. 10, entailing a loss of over \$100,000. The cold storage plant was destroyed as well as the bakery.

**Galt, Ont.**—For the purpose of manufacturing sand brick by a new process, an invention of John T. Jackson of Toronto, the Dominion Building Products, Ltd., has been organized, with Dr. David D. Williams, of Toronto, president, W. J. Heron, Galt, vice-president, and John T. Jackson, managing director. Vice-President Heron announced that the erection of a plant in Galt will be commenced in a few weeks, and other plants will be established at Toronto, Sarnia, Owen Sound, Sudbury and Picton. The headquarters of the concern will be at Galt, where almost unlimited quantities of suitable sand are obtainable. Each plant will have capacity of 190,000 bricks per day.

## Municipal

**Milton, Ont.**—The Town Council propose spending \$5,000 on additional fire equipment.

**Winnipeg, Man.**—The Board of Control are in the market for fifteen fire alarm boxes and 3,000 feet of hose.

**Aylmer, Que.**—The Town Council have decided to call new tenders for the proposed filtration plant, the recent bids having been rejected.

**Saskatoon, Sask.**—This City Council has passed a by-law to provide for the erection of an incinerator plant to cost \$100,000. G. H. Archibald is the engineer.

**St. Marys, Ont.**—The Town Council are considering the installation of an auxiliary gasoline waterworks plant at an approximate cost of \$4,000.

**Chatham, Ont.**—The City Council propose to extend a 12-in. main along King street west from Lacroix to Robertson Avenue, and thence to run a 10-inch main to the Dominion Sugar Co. plant.

**Halifax N.S.**—The Board of Control have received tenders on water meters but no award has been made yet. It is likely that 500 meters will be purchased at the present time and not 3000 as was originally intended.

**Swift Current, Sask.**—The City Council proposes to make extensive additions to its power plant. Two plans of operation are contemplated, one a gas plant at a cost of \$100,000 and the other a steam plant to cost \$34,000. J. W. Calder is city engineer.

**Kingston, Ont.**—Lieut.-Col. McCammon, camp sanitary officer, is arranging for the installation of a new system of injecting chlorine into the water of Barriefield Camp. A specialist from New York is here for the work and new apparatus will be installed, which promises to completely take the taste of chlorine out of the camp water.

**Renfrew, Ont.**—The ratepayers have defeated by a majority of 64 a by-law for power development on the Bonnehere River by the Hydro-Electric Power Commission of Ontario. M. J. O'Brien offered to develop 5,000 h.p. on the Madawaska at \$15 per h.p. The ratepayers thought this proposal better than having the commission bring 1,500 h.p. from the Bonnehere at \$13 per h.p.

**Kitchener, Ont.**—At a meeting of the City Council held on Sept. 5, the recommendation of the Finance Committee that the request of the Water Commissioners, asking the Council to raise the sum of \$100,000 for the erec-

tion and completion of a waterworks plant in Bridgeport, with the necessary connections to the present system, be granted, was adopted. The plans for the new system have been accepted by the Provincial Board of Health.

## Wood-Working

**Guelph, Ont.**—Fire on Saturday destroyed George McAllister's saw mill.

**Clarksburg, Ont.**—The A. E. Pedwell Co. planing mill was recently destroyed by fire. The loss is estimated at \$4,000.

## Railways—Bridges

**Montreal, Que.**—The C. N. R. has made satisfactory financial arrangements to finish its terminals here.

**Vancouver, B.C.**—The Harbor Commissioners will submit plans to the City Council with regard to the proposed harbor terminal railways.

**Guelph, Ont.**—Although no definite announcement has been made, it is expected that the Toronto Suburban Railway between Guelph and Toronto will be in operation about the first of October.

## Marine

**Port Arthur, Ont.**—The steamer Masaba, of Toronto, which grounded recently at Victoria Island, Lake Superior, has been released and brought here for repairs.

**Sarnia, Ont.**—The Reid Wrecking Co. has been awarded the contract for raising the steamer Henry Houghton, which sank at Mullen's coal dock, Sandwich, Ont., on September 6. The wreckers guarantee to have the Houghton up in five days. If they succeed within the time limit they are to receive a bonus of \$500 from the Mullen Coal Co.

**Halifax, N.S.**—The St. Peter's Canal, which connects the Bras d'Or Lakes with the Atlantic at the Strait of Canso, and which has been closed for more than a year while being enlarged, was formally re-opened on September 2. This canal was first opened in 1865 and, with comparatively slight changes, has been operated since then. The lock has now been lengthened about 250 feet and a curve in the alignment is to some extent eliminated. The entrance to the canal at the southern end has been widened and enlarged, making a commodious and sheltered dock for vessels awaiting passage through to the Bras d'Or Lake. This canal makes it possible to carry on a considerable trade by sailing vessels and steamers drawing not more than 17 feet of water.

## 50% Boring Economy!

8"  
Shells

High-salaried men are employed to keep the cost of production down, but in this case a boy could see the advantages to be obtained through these boring heads. 25% to 50% reduction is obtained only by the use of Davis Boring Heads. These consist of 16 sizes and 26 different styles, and embrace every operation from a shell of the smallest calibre to 8" and 9.2". (The quality of work produced is limited, and that limit is highest quality.)

Davis Boring Heads are constructed of high-speed steel and are the result of years of scientific knowledge of boring-tool requirements and the experience obtained by the "pioneering" days.

WRITE FOR PARTICULARS

The heads illustrated here are used for operations on 8" and 9.2" shells. The heads are all equipped with micrometer adjustments. This enables more speed to be put to the operation, leaving the adjusting of the cutters to the micrometer.

9.2"  
Shells

# The A. R.

Machinery Co., Limited

# Williams

64-66 Front St. W., Toronto

This Geometric Die Head is threading a malleable iron casting, on a Jones & Lamson Machine, in the plant of the Detroit Gear & Machine Co., where they make transmission and internal drive rear axles.

Have you investigated the merits of the Geometric Self-opening and Adjustable Die Heads? It will cost you nothing to get our quotation on your specifications.

## The Geometric Tool Company, New Haven, Conn., U.S.A.

## Trade Gossip

**The Beaver Wood Fibre Co.,** has increased its capital stock to \$2,000,000.

**U.S. Copper Refined.**—It is estimated that the refinery yield of copper in the United States during the month of August ran between 150,000,000 and 160,000,000 pounds. The high record on present capacity was established last May, with approximately 190,000,000 pounds of refined copper being produced by the various plants of the United States.

**Royal Commission Visits Cobalt.**—The Dominions Royal Commission, inquiring into the resources of the Colonies of the Empire, recently visited Cobalt and Timmins. From there they proceeded to British Columbia. The party consisted of Sir George Foster, Hon. Sir Edgar Bowring, W. Lormier, Joseph Tatlow, Mr. Harding, secretary, and Mr. Bridgeman, clerk. Mr. Thomas Gibson, Deputy Minister of Mines for Ontario, accompanied the party.

**The Newsprint Market.**—Stocks of newsprint in hands of producers in United States and Canada at end of July were probably in the neighborhood of 63,000 tons, according to best information available at present. The normal average of stocks on hand at this time is between 80,000 and 90,000 tons. On June 31, 1915, they were close to 93,000 tons. Manufacturers have been unable to build up their reserve stocks as usual during the summer, owing to unprecedented demand.

**C.N.R. Mileage.**—Among the interesting items included in the annual report of the Canadian Northern Railway Co. is the statement of mileage which totals 7,761 miles, distributed among the Provinces and States as follows:

Province of Nova Scotia . . . .	380.76
Province of Quebec . . . . .	626.77
Province of Ontario . . . . .	1,480.65
Province of Manitoba . . . . .	1,983.46
Province of Saskatchewan . . . .	2,111.85
Province of Alberta . . . . .	962.19
State of Minnesota . . . . .	215.42
Total mileage . . . . .	7,761.10

**Kingston, Ont.**—Frontenac County will soon have an industry that will mean exports to extent of \$100,000 this year and possibly double that amount next year. The feldspar of the county will be mined on an extensive scale to meet the demand for potash, enamel requirements and fertilizing. There are five companies operating in this district. The Richardson properties at Desert Lake have been taken over by Feldspar, Limited, while a Buffalo firm has announced its intention of handling 220 tons daily.

**Russia in Need of Leather.**—C. F. Just, Canadian Government commercial agent in Petrograd, Russia, reports that steps are being taken to organize a combined leather selling agency for Russia which will deal only in leathers produced in the countries allied with Russia in the present war. Plans are being formed for business after the war, and it is hoped that a substantial portion of the leather trade which was controlled by German manufacturers before the war will be captured. The agency will have its branches in four or five leading centres of consumption in Russia. It is desired to add some of the leading Canadian leather manufacturers to the list of firms supporting the selling agency. Further particulars may be obtained on application to the Commercial Intelligence Branch of the Department of Trade and Commerce, Ottawa.

## New Incorporations

**The Sudbury Nickel Refineries** has been licensed to carry on business in Toronto, with a capital not exceeding \$5,000,000. Angus W. Fraser, of Toronto, is the attorney.

**The Deloro Smelting & Refining Co.** has been licensed to carry on business in the Province of Ontario with a capital not exceeding \$1,000,000. Thomas Southworth, of Toronto, is the attorney.

**Drummondville Matches, Ltd.,** has been incorporated at Ottawa, with a capital of \$100,000, to manufacture matches at Drummondville, Que. Incorporators: C. Beauchamp, J. A. Desautels and H. Brosseau, all of Montreal.

**The Rapid Tool & Machine Co.** has been incorporated at Ottawa, with a capital of \$40,000, to make machine tools, gauges and motors of all kinds at Lachine, Que. Incorporators are: John MacNaughton and J. G. Cartwright, all of Montreal.

**The Sterns Tire & Tube Co. of Canada** has been incorporated at Ottawa, with a capital of \$1,000,000, to manufacture automobiles and parts, with head office at Toronto, Ont. Incorporators: J. L. Ross, L. F. Lambier and A. S. Maerae, all of Toronto.

**The Jackson Construction Co.** has been incorporated at Ottawa, with a capital of \$30,000, to carry on the business of contractors and engineers, with head office at Batiscan, Que. Incorporators: B. Melancon, A. Dufort and A. Dufresne, all of Montreal.

**Consolidated Steel Foundries** has been incorporated at Ottawa, with a capital of \$500,000, to carry on the business of steel makers, engineers and sheet metal workers, etc., with head office at Montreal.

Incorporators are: L. E. Bernard, W. A. Handfield and J. A. Sullivan, all of Montreal.

**Canadian Zinc Products Co.** has been incorporated at Ottawa, with a capital of \$45,000, to deal in ores and metals of all kinds, with head office at Montreal. Incorporators are: R. F. Maxey, of Portland, Me., also L. D. Adams and A. R. Holden, of Montreal.

## Tenders

**Toronto, Ont.**—Tenders will be received until October 2, addressed to the Chairman of the Toronto Harbor Commissioners, and marked "Tenders for Cherry Street Bascule Bridge." All information may be obtained by applying to E. L. Cousins, chief engineer and manager.

**Ottawa, Ont.**—Tenders will be received until September 29, for the construction of an extension to the west breakwater at Port Stanley, Elgin County, Ont. Plans and forms of contract can be seen, and specification and forms of tender obtained at the Department of Public Works, Ottawa, at the offices of the District Engineers at Windsor, Ont., and Equity Building, Toronto, Ont., also on application to the Postmaster at Port Stanley, Ont.

**Ottawa, Ont.**—Tenders addressed to J. W. Pugsley, Secretary Department of Railways and Canals, Ottawa, Ont., will be received up to September 18, for the construction of foundations for 500,000 bushel storage capacity grain elevator, working house and track shed at St. John, N.B. Plans, specifications and blank form of contract may be seen at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa; at the office of the Chief Engineer, Moncton, N.B.; at the office of the Terminal Agent, St. John, N.B. and at the office of the John S. Metcalfe Co., Engineers, Montreal, P.Q.

**Ottawa, Ont.**—Tenders will be received up to October 2 for the under-mentioned metal supplies for delivery to H.M.C. Dockyards at Halifax, N.S., and Esquimalt, B.C., Items 1, steel angles, bars, sheets and plates; 2, iron bars, fire bar; 3, brass bars and sheets; 4, copper sheets and bars; 5, solder tin and alloys; 6, tubes brass and copper. Forms of tender and full information may be obtained by application to the Department at Ottawa, or to the Naval Store Officers, at H.M.C. Dockyard Halifax, N.S., and Esquimalt B.C. In making application for forms, the particular item or items for which forms are required should be clearly stated.

# WAR LOAN

## DOMINION OF CANADA

Issue of \$100,000,000 5% Bonds, Maturing 1st October, 1931

PAYABLE AT PAR AT

OTTAWA, HALIFAX, ST. JOHN, CHARLOTTETOWN, MONTREAL, TORONTO, WINNIPEG,  
REGINA, CALGARY, VICTORIA

INTEREST PAYABLE HALF-YEARLY, 1st APRIL, 1st OCTOBER.  
PRINCIPAL AND INTEREST PAYABLE IN GOLD.

### ISSUE PRICE 97 $\frac{1}{2}$

*A Full Half-Year's Interest will be  
Paid on 1st April, 1917.*

*The Proceeds of the Loan will be  
Used for War Purposes Only.*

The Minister of Finance offers herewith, on behalf of the Government, the above named Bonds for subscription at 97 $\frac{1}{2}$ , payable as follows:—

10	per cent. on application;
30	“ “ 16th October, 1916;
30	“ “ 15th November, 1916;
27 $\frac{1}{2}$	“ “ 15th December, 1916.

The total allotment of bonds of this issue will be limited to one hundred million dollars, exclusive of the amount (if any) paid for by the surrender of bonds as the equivalent of cash under the terms of the War Loan prospectus of 22nd November, 1915.

The instalments may be paid in full on the 16th day of October, 1916, or on any instalment due date thereafter, under discount at the rate of four per cent. per annum. All payments are to be made to a chartered bank for the credit of the Minister of Finance. Failure to pay any instalment when due will render previous payments liable to forfeiture and the allotment to cancellation.

Subscriptions, accompanied by a deposit of ten per cent. of the amount subscribed, must be forwarded through the medium of a chartered bank. Any branch in Canada of any chartered bank will receive subscriptions and issue provisional receipts.

This loan is authorized under Act of the Parliament of Canada, and both principal and interest will be a charge upon the Consolidated Revenue Fund.

Forms of application may be obtained from any branch in Canada of any chartered bank and at the office of any Assistant Receiver General in Canada.

Subscriptions must be for even hundreds of dollars.

In case of partial allotments the surplus deposit will be applied towards payment of the amount due on the October instalment.

Scrip certificates, non-negotiable or payable to bearer in accordance with the choice of the applicant for registered or bearer bonds, will be issued, after allotment, in exchange for the provisional receipts.

When the scrip certificates have been paid in full and payment endorsed thereon by the bank receiving the money, they may be exchanged for bonds, when prepared, with coupons attached, payable to bearer or registered as

to principal, or for fully registered bonds, when prepared, without coupons, in accordance with the application.

Delivery of scrip certificates and of bonds will be made through the chartered banks.

The issue will be exempt from taxes—including any income tax—imposed in pursuance of legislation enacted by the Parliament of Canada.

The bonds with coupons will be issued in denominations of \$100, \$500, \$1,000. Fully registered bonds without coupons will be issued in denominations of \$1,000, \$5,000, or any authorized multiple of \$5,000.

The bonds will be paid at maturity at par at the office of the Minister of Finance and Receiver General at Ottawa, or at the office of the Assistant Receiver General at Halifax, St. John, Charlottetown, Montreal, Toronto, Winnipeg, Regina, Calgary, or Victoria.

The interest on the fully registered bonds will be paid by cheque, which will be remitted by post. Interest on bonds with coupons will be paid on surrender of coupons. Both cheques and coupons will be payable free of exchange at any branch in Canada of any chartered bank.

Subject to the payment of twenty-five cents for each new bond issued, holders of fully registered bonds without coupons will have the right to convert into bonds of the denomination of \$1,000 with coupons, and holders of bonds with coupons will have the right to convert into fully registered bonds of authorized denominations without coupons at any time on application to the Minister of Finance.

The books of the loan will be kept at the Department of Finance, Ottawa.

Application will be made in due course for the listing of the issue on the Montreal and Toronto Stock Exchanges.

Recognized bond and stock brokers will be allowed a commission of one-quarter of one per cent. on allotments made in respect of applications bearing their stamp, provided, however, that no commission will be allowed in respect of the amount of any allotment paid for by the surrender of bonds issued under the War Loan prospectus of 22nd November, 1915. No commission will be allowed in respect of applications on forms which have not been printed by the King's Printer.

**Subscription List will close on or before 23rd September, 1916.**

**Department of Finance, Ottawa, September 12th, 1916.**

## Contracts Awarded

**The Turnbull Elevator Mfg. Co.,** Toronto, have been awarded a contract for the elevators for the hospital at Ingersoll, Ont.

**Antigonish, N.S.**—The contract for the erection of a new library building for St. Francois Xavier University has been let. A gymnasium will also be built.

**Toronto, Ont.**—The Scarborough Township Council have awarded a contract to the Ontario Bridge Co. for a steel bridge over the Rouge River, to cost \$1,700.

# PURO

(MADE IN CANADA.)

## Saves Dollars

Why let that old-fashioned faucet go on year after year wasting water—MONEY? Why more drinking cups and glasses, only to become unsanitary—lost, broken or carried away? Puro Sanitary Drinking Fountain stops all this needless waste. Puro saves you 35% on the water bill alone. Puro saves you all that money you spend for cups. YET Puro is always ready with a clear, cool drink with dollars in the bank.

## Puro Pays for Itself

You don't have to wait years to get back the small investment you have tied up in Puro equipment—

You start cashing in at once—not only on your water bill saving, but on the increased efficiency of your workmen as well.

Men like PURO—it's clean. No danger of deadly germs lurking in its sparkling bubble. Write us—tell how many men, how many departments, and we'll tell you how much the cost will be to

## Personal

**Major William Ashplant**, formerly city engineer of London, Ont., has been wounded in France.

**O. W. Cook**, works manager of the Canadian Cartridge Co., Hamilton, Ont., was recently appointed manager of the entire organization.

**James Balkwill** has been appointed superintendent of the M. C. R. at St. Thomas, Ont. Mr. Balkwill is the first Canadian to occupy this position.

**Thomas John Kennedy**, president and general manager of the Algoma Central & Hudson Bay Railway Co., and the Algoma Eastern Railway Co., died at his home in Sault Ste. Marie, Ont., on August 30, aged 61.

**J. H. Plummer**, former president of the Dominion Steel Corporation, who has been abroad since he resigned from the presidency some time ago, returned to Toronto on September 2. Mr. Plummer is greatly improved in health.

**Thomas Doherty**, Mayor of Sarnia, Ont., and president of the Doherty Mfg. Co., died suddenly on September 6, aged 70. Mayor Doherty went to Sarnia from Brantford 35 years ago, and had been in the stove business since.

**Lord Shaughnessy**, president of the C. P. R., has left Montreal for the annual inspection of the company's lines through to the coast. Accompanying him are Directors Sir Herbert Holt, R. B. Angus and E. W. Beattie, K.C., Sir Edmund Osler and W. D. Matthews. General Manager A. D. MacTier will go as far as Fort William, where the train will be met by Western officers, who will conduct the party West. The trip will occupy about three weeks.

## Building Notes

**Toronto, Ont.**—A building permit has been granted to Henry Griesman for a 3-storey brick factory to cost \$20,000.

**St. John, N.B.**—The School Board has decided to proceed with the erection of a new school building on Bentley Street at a cost of \$70,000.

**St. John, N.B.**—The Crosby Molasses Co. are building a large brick addition to their warehouse on City Road. Grant & Horne are the contractors.

**St. John, N.B.**—Ground has been broken for a Catholic High School for girls. The building will be three storeys high and 123 ft. by 87 ft.

**St. John, N.B.**—Grant & Horne, contractors, have recently completed the construction of storage warehouses for

the Atlantic Sugar Refineries at a cost of \$33,000.

**Toronto, Ont.**—At a meeting of the Separate School Board, held recently, a by-law was passed authorizing the chairman of the Finance Committee, Rev. Dean Moyna, and Secretary-Treasurer Rev. J. J. McGrand to borrow \$40,000 for building purposes.

**Simcoe, Ont.**—Tenders will be received by the Secretary of the Simcoe Board of Education, up to August 30th, for the various trades required in the erection of two new school buildings. Plans and specifications may be obtained upon application to Chapman and McGiffin, 95 King Street East, Toronto.

## The Metals Coating Co. of Canada, Ltd.

Versailles Building, 90 James St.  
MONTREAL, CANADA

A machine gun making its ammunition from Reeled Wire, and coating objects by bombarding with minute plastic particles of metal. The Schoop method of Metallic deposition, any object and any size coated with a positive adhesive and homogeneous coating with any metal for any desired thickness.

Solves one of the greatest problems heretofore confronting the structural engineer, because it produces on iron or steel a permanent coating not susceptible to corrosion.

Carbons can be coated with copper, etc.

For full information write for booklet "D".

## Refrigeration

**Montreal, Que.**—Armour & Co. will build a packing plant and power house here.

**Montreal, Que.**—The British Munitions Co. had their plant equipped with three refrigerating machines of 50 tons capacity each, together with three batteries of cooling coils, all furnished by the Frick Co., Waynesboro, Pa., and installed by the Carrier Engineering Corporation, New York, N.Y.

## Catalogues

**Belts,** the house organ of the Federal Engineering Co., Toronto, contains in the August issue, humorous stories and some interesting matter relative to belting.

**Mechanics' Tools.**—The Keystone Mfg. Co., Buffalo, N.Y., have issued a new catalogue, No. 24, illustrating and describing an interesting line of mechanics' tools, including ratchets, wrenches, sockets, drill sleeves, etc. A complete price list is included for the various lines.

**Smooth-On Instruction Book No. 16,** just off the press, is being distributed to the trade by the Smooth-On Manufacturing Co., Jersey City, N.J. This book, as in the case of previous issues, will be of considerable value to those in charge of machine shops and foundries. The book contains much of the original matter, but in addition, many new examples and illustrations, showing the working of the different "Smooth-On" cements, have been included. The book contains numerous testimonials from users of "Smooth-On" products, accompanied by illustrations showing different classes of work where these materials have been used. Copies will be sent to anyone forwarding their name and address.

**Strength of Webs of I-beams and Girders.**—For the purpose of studying the web strains in I-beams and girders tests have been conducted at the Engineering Experiment Station of the University of Illinois on a number of specimens consisting of 12-inch I-beams having webs planed down to a thin section and 24-inch built-up girders having webs of thin plates. The test data were used in conjunction with a mathematical analysis to determine the importance of the diagonal strains and the methods of failure of girders. The results show (a) that, in general, the shearing stress is a maximum at the neutral axis, but that diagonal stress at the junction of web

and flange must be considered; (b) that approximate methods of computing shearing stress in webs should, under certain conditions, be checked by more exact methods; (c) that stiffeners at supports and under concentrated loads are very necessary; and (d) a formula is developed for the buckling strength of webs. The investigations were conducted by Professor H. F. Moore and Professor W. M. Wilson. The results are described in Bulletin No. 86 of the Engineering Experiment Station, copies of which may be obtained upon application to W. F. M. Goss, director, Urbana, Illinois.

**Water Lift Pump.**—The Buckeye Pump Mfg. Co., Columbus, Ohio, have issued a folder containing suggestions for installing the "Buckeye" water lift pump, together with a diagram showing the necessary piping and connections for a typical installation. A sectional view of the pump is included showing its construction, accompanied by a table giving the principal dimensions of the various sizes.

**High Pressure Tanks.**—The Wm. B. Searle & Sons Co., Pittsburg, Pa., have recently issued a catalogue dealing with their line of copper brazed high pressure tanks for air, gas and liquids. The construction of these tanks is described, followed by a general specification and tables, giving the working pressures and dimensions for painted and galvanized pressure tanks. One section of the catalogue illustrates and describes brazed and riveted pneumatic tanks for a variety of purposes, and include tables giving the capacity, weight and prices of the various sizes of each type. Another section deals in the same way with garage air and gasoline tanks. The concluding section illustrates and describes a line of range boilers.

**Portable Conveyers.**—Bulletin No. 184, just off the press, features an interesting line of portable conveyors and stackers for handling barrels, bags, boxes and miscellaneous packages, made by the Jeffrey Mfg. Co. The equipments illustrated and described in this bulletin are adapted to a wide range of industries, such as bakeries, breweries, cement mills, flour mills, glue factories, paint works, salt works, sugar refineries, warehouses, docks and storage where large quantities of material are handled in packed form; for stacking purposes, for loading material into shipping platforms, into freight cars, etc. Free copies may be obtained by interested persons, by addressing the Canadian office of the Jeffrey Mfg. Co., Power Building, Montreal, Que.

### ENGINEERING EXHIBITS, 1916 CANADIAN NATIONAL EXHIBITION

A COMPLETE line of electric and gas furnaces for all workshop purposes was shown by Canadian Hoskins. The former include small experimental and analytical electric apparatus, increasing in size to large workshop types for heavy work and rough usage. One furnace was shown which dispenses with the muffle formerly deemed necessary with electric furnaces. Large diameter hairpin units are laid in moulded grooves in the walls and covered with alundum cement. When renewals are necessary the cement is pried loose and replaced with new stuff at trifling cost compared with new muffles, which were formerly required. An electric oil tempering furnace was also exhibited, which entirely overcomes all fire risks incidental to gas heating. The gas furnaces exhibited were of heavy cast iron shell construction with reinforced sides and  $4\frac{1}{2}$  in. steel mixture fire brick lining, with 1 in. asbestos. Other gas furnaces shown were for treating high-speed steel, also crucible types for lead, cyanide and barium baths.

An exhibit of particular interest to the woodworking industry was in the form of a complete working model of a Linderman automatic jointer. This model was exhibited by the Garlock-Walker Machinery Co., whose exhibit also included special munition lathes and a full range of Thor pneumatic tools. Specially interesting were samples of work done on the Linderman machine, which, in a few seconds, performs all of the operations necessary for uniting lumber automatically—that is, making narrow lumber wide for any purpose by means of an auto-clamping taper wedge dovetail. Jointing, gluing, clamping, and sizing of panels to finished widths are combined into one operation, thus doing work which formerly required three to five separate operations and machines. The work done by this machine is of particular value in furniture building, producing dependable glue joints in quartered oak, mahogany, gum, walnut, maple, etc.

Oxy-acetylene welding is now thoroughly established as an industrial process, and numerous samples of Canadian work and apparatus were shown by L'Air Liquide Society and Carter Welding Co. Steel barrels, tanks, and other sheet metal goods with welded seams were a feature of the former exhibit, while mechanical applications of the process to cutting irregular shapes by means of a pantographic device known as the Oxygraph were prominent in the latter display. All the necessary apparatus, including generators, torches, gauges, carbide and oxygen cylinders were available for inspection in both exhibits.

The exhibits in the Machinery Hall have usually been confined to products of direct interest to machinery and

Steel Shell Forgings or Billets of any size or weight will move any distance or about curves upon our specially constructed Gravity Carriers and Incline or Horizontal power devices. No labor required.

## KEYSEATER

for Milling Internal Keyseats

This tool is an attachment for the drilling machine, and is regularly made with straight shank for gripping in the drill chuck; taper shank can be had if desired. The tool is fitted with a high-speed steel rotary cutter for milling internal keyseats in one cut. To complete a keyseat it is only required to pass the tool through the hole just once. Innumerable inexpensive eccentric bushings are supplied whereby the tool may be bushed to meet any diameter above its own.

Eastern Representative: H. E. O. Bull  
184 Mance St. Montreal, P. Q.

power plant builders and users, while products of a more general nature are located in a suitable part of the grounds where ample space is available for display and demonstration. Makers of engines, windmills, pumps, farm machinery of all kinds, agricultural implements, building materials, road, concrete and municipal machinery of various descriptions were here represented, their number and scope indicating to some extent the possibilities of future development in foreign trade. The view of one of the avenues in this part of the ground gives a slight idea of the extent of these exhibits. Farm tractors, gasoline engines, flour mills, dairy supplies, silo systems, glass houses, metal shingles, patent roofing materials, bricks, fertilizers, incubators, and concrete mixers lined both sides of several avenues, while ditch digging machines and motor plows were demonstrated before hundreds of interested spectators.

Among the engineering exhibitors in the grounds were:

Avery Co., Peoria, Ill.—Tractors.

Buckeye Traction Ditcher Co., Findlay, O.—Combined tractor and ditch digger.

Beath & Son, W. D., Toronto—Conveyor apparatus for farm use.

Bateman-Wilkinson Co., Toronto—Agricultural implements, engines, etc.

Canadian Fairbanks-Morse Co., Toronto—Engines, pumps, flour mill, etc.

Canadian Engines, Dunville, Ont.—Engines.

Chapman Engine & Mfg. Co., Dundas, Ont.—Engines.

De Laval Dairy Supply Co., Peterboro, Ont.—Engines and dairy apparatus.

Gibson Mfg. Co., Guelph, Ont.—Engines.

International Harvester Co., Hamilton—Tractors, plows, engines, etc.

Lister & Co., R. A., Toronto—Engines, pumps, lighting plants, etc.

Ontario Wind Engine & Pump Co., Toronto—Engines.

Wettlauffer Bros., Toronto—Concrete machinery.

Waterous Co., Brantford, Ont.—Road rollers.

# Motion and Relative Position of Projectiles in Flight

Staff Article

*In our last week's issue, the Effect of Gravitation on the Flight of Projectiles was discussed. That the design and constructional features of the projectile itself, and the necessity of a special provision being made for its progress through the gun barrel, are relatively of perhaps more importance than the gravitation effect, is demonstrated in the present article.*

**T**HE obtaining of the desired range of a field gun, and maintaining same within a certain degree of permanency, depends largely upon the accuracy with which the projectile has been constructed, and the action of the shell in its flight through space. The possibilities of error are so numerous—owing to the variety of operations—that the greatest care is taken to secure a uniform product: thus eliminating, as far as possible, the chances of misplaced shells. It is essential that the centre of gravity should lie upon the axis of the moving body, otherwise the several

If the shell is uniform in every respect, the flight will form a true trajectory; but when faulty ammunition is used, the resultant action may prove unreliable. Should the centre of gravity fall to one side of the revolving body, the action of centrifugal force will be similar to that of an unbalanced pulley, and being unrestrained, the path of the shell will form a long spiral, with gradually increasing diameter; the apex being at the gun muzzle, and the axis of the spiral forming the true trajectory. An exaggerated sketch of this action is shown in Fig. 1: the pitch  $P$  of the spi-

FIG. 1—ROTARY MOTION OF PROJECTILE

forces will have varying effects upon the shell in its flight. To increase the accuracy of predetermined direction, the shells, in modern field pieces, are given a rotating motion as they are passing out of the gun barrel. This is effected by a series of helical grooves running the entire length of the bore. When the charge is ignited, the expanding gases propel the shell outward, and the copper band—placed near the base of the shell—is forced into the grooves of the rifling, causing the shell to revolve about its axis as it passes through the gun chamber. The speed at which the projectile is revolved, depends upon the pitch of the rifling and the velocity of the moving shell.

## Rotary Motion of Projectile.

The pitch of the grooves varies in different makes and sizes of ordnance. In certain makes, the pitch at the breech is about 50 times the calibre; and this is gradually reduced to about 25 at the muzzle end, causing an increase in rotary motion in unison with the accelerated velocity. Suppose the rotary motion of the shell at the muzzle is one turn in 30 feet; then, with a velocity of 1,200 feet per second, the speed of the shell about its own axis, will be

$$\frac{1200}{30} \times 60 = 2,400 \text{ revolutions per min.}$$

therefore, in a flight of 20 seconds, the projectile will revolve about 800 times.

ral being approximately that of the gun rifling, the dotted line indicating the path of the shell, the axis remaining parallel to the line of trajectory. However, the process of construction and inspection are so thorough that these conditions are seldom experienced.

## Shell Position in Flight

Some writers contend that, owing to the gyroscopic action of the rapidly moving projectile, the axis of the shell will retain the same angle with the horizontal at which it was discharged; as shown at A, A, Fig. 2. This condition might be true if no external forces were acting on the body; but the action of the air upon the exposed surface causes the projectile to take the path of least resistance, which, in a perfectly constructed shell, will be nose foremost. The axis of a

to form a parabolic curve, while the air resistance keeps the axis of a true shell in a parallel position to this curve. Should the shell be inclined to retain the same angle at which it was projected, as shown at A, Fig. 2, or an opposite direction, as at B, the force of the air upon the larger area at the base, would bring the axis again in line; the final or striking position being that shown at C. The sketch D illustrates the action of the air upon the shell, which keeps the nose pointing to the wind, in like manner to a weather-vane. Armour piercing shells must strike nose on, to effectually accomplish their intended purpose.

If shells were to retain their initial angle of projection, the action of shrapnel, at the moment of discharge, would be as shown at A, Fig. 3, while the intended discharge of an accurate shell takes place as shown at B; the contents being directed at the target with increased velocity, the effect of the reaction of the explosion throwing the empty shell back, as at C. However, there are instances when projectiles will, through faulty construction, etc., behave very erratically, sometimes causing serious accident where not intended. Therefore, it is essential that the strictest adherence be exercised at all times to specifications of material and manufacture.

## Power of Propelling Gases

Some conception of the power required to discharge a shell at a given velocity, may be had by calculating the work done by the propelling charge. Suppose a 100 pound shell is fired from a 6-inch gun, having a length of bore of 8 feet, and acquires a muzzle velocity of 1,200 feet per second; what would be

FIG. 2—SHELL POSITIONS IN FLIGHT

projectile should always remain parallel with the line of trajectory.

A shell, when leaving the gun barrel, tends to retain its original direction; but the force of gravity causes the path

the approximate horse power developed, power absorbed by friction being taken at 12½ per cent.?

As the muzzle velocity is given at 1,200 feet per second, it is evident that

the shell has acquired this velocity from a state of rest while travelling through a distance of 8 feet, or the length of the gun barrel. The apparent time taken for the projectile to reach the muzzle will be the length of the gun divided by the final velocity, or, 8 divided by 1,200 equals .007 seconds. This time is

FIG. 2. DISCHARGE FEATURES OF SHRAPNEL.

however, on the basis that the shell was travelling at muzzle velocity for the entire 8 feet; while in reality, time is occupied in the acceleration of the projectile. The acceleration can be found from the formula

$$A = \frac{V}{2S} = \frac{1200 \times 1200}{2 \times 8} = 90000$$

Then the time taken for the shell to obtain a velocity of 1200 feet per second in a length of 8 feet from a state of rest will be the final velocity divided by the acceleration, or

$$\frac{1200}{90000} = .013 \text{ seconds.}$$

Now, the work done by the expanding gases can be found by multiplying the weight of the projectile by the space passed over in feet, or by formula:  $W = F \times S = 100 \times 8 = 800$  foot pounds. Where  $W$  equals the work done in foot pounds,  $F$  equals the weight or resistance overcome, and  $S$  the space passed over in feet. However, as the work is performed in .013 seconds, the power required will be found from the formula.

$$H. P. = \frac{F \times S}{T \times 33000}, \text{ where } T \text{ equals the time in minutes; then}$$

$$\frac{100 \times 8 \times 60}{.013 \times 33000} = 112 \text{ H. P.}$$

As this represents 87½ per cent. of the generated power, the total power contained in the explosive charge will be approximately 128 H. P.

### ELECTRIC LIFT TRANSMISSION

THE most essential part of a lift is the driving sheave, or alternatively the drum. There used to be a great difference of opinion as to the rival merits of the drum and sheave, but the principle of the driving sheave is now admitted to be the better. In a sheave lift the ropes

only pass a half turn more or less round the driving sheave, the grooves of which are cut at such an angle as to give the necessary grip to the ropes with a minimum of distortion. In a drum lift the ropes are anchored to the drum at one end and wind up upon it in a spiral groove cut upon its surface. The advantages claimed for the drum are, that, owing to the grooves being made to the shape of the rope, instead of being veed,

the rope life is longer. This, however, is only the case provided the drum is large in diameter.

A drum of small diameter now usually employed is more destructive to the ropes than a sheave of large diameter, which is essential when the gear is situated at the top of the well and leading wheels are not employed. With a drum drive a standard gear may be made up and used for lifts of different dimensions. The same can be done with the sheave device, but by so doing one of the great advantages of the system is lost, viz., the saving of all leading wheels and the attending losses and rope damage. The disadvantages of the drum drive are the impossibility of slip in case of overrunning. This means that if limit switches and limit safety devices fail, something must break, as the ropes are positively driven from the drum. This difficulty necessitates the introduction of additional safety devices, which are unnecessary with sheave driving.

### Sheave Drive

With a sheave lift, in the event of overrunning, either the car or the counterweight lands upon the buffers, and the tension being so removed from the ropes, the driving sheave can continue to revolve under the ropes with no risk of anything serious happening. This state of things has been known to exist during a whole night, and the ropes to show no serious wear in the morning. The advantage of increased safety alone is sufficient to recommend sheave driving, as compared with the drum winding system, but there is a second advantage. With a sheave there is practically no limit to the number of ropes which may be employed, whereas if a drum is to be kept to reasonable dimensions the number of ropes must be reduced to a minimum in order to find room for them to coil on the drum. As a consequence it is usual to find four ropes to a sheave-driven lift against two on a drum lift driven lift against two on a drum lift.

To obtain equal strength, the ropes on the drum lift must be larger in diameter, and in consequence will suffer more from bending round the drum and leading wheels. The driving sheave should be substantial, of the disc pattern, and not of the light spoked variety, which is apt to develop cracks from no obvious cause whatever. The grooves must be cut with care to the exact angle to ensure correct driving with minimum wear on the ropes. It is a frequent business to re-cut the grooves on the sheaves of old lifts coming under maintenance contract in order to reduce the annual rope bill. The driving sheave should be as large in diameter as possible, so as to give a maximum of driving surface and a minimum radius round which the ropes have to bend. This provision is usually amply complied with by making the sheave span from the centre line of the car to the centre line of counterweight.

### Leading or Guide Wheels

Leading wheels—that is, wheels to guide the ropes to the required position over the car or counterweight—should, when they are necessary, be provided with spindles giving ample bearing surface, and they should be well lubricated. Those wheels often sustain great weight, and the designer using a standard wheel does not always stop to calculate the pressure in individual cases. Passenger lifts are not usually designed for speeds exceeding 200 feet per minute, but the tendency is to increase the rate of travel.

### Rope Features

The form of stranding for ropes found to be most satisfactory for all-round lift work is that known as 6-19 in., layered up round a hemp core; 6-24 and 6-30 ropes give much greater flexibility, but the finer wires wear more quickly. A good rule for deciding upon the ropes required is to allow for a set of four ropes a breaking strain of six times full load upon each rope, and for a set of two ropes a similar margin of seven times. Good ropes should not be grudged, for the cost of labor in changing a set of ropes is often as much as the cost of the ropes themselves. When one rope in a set requires renewal it is therefore economy to renew the whole set. The car is supported by a sling of wrought iron which carries four guiding shoes. These must be accurately shaped to fit guides, and preferably be made or lined with gun-metal. They should be mounted upon spring boxes so designed as to maintain them in constant and nicely balanced pressure upon the guides, so that any uneven loading or swaying of the car will be automatically taken up. The pressure of the springs in the boxes should be capable of regulation.—From a paper read before the Association of Supervising Electricians.

# Observations on the Quebec Bridge Centre Span Tragedy

By C. T. R.

*Many opinions have been expressed, not a few theories have been developed, and from observation and otherwise there is a conflict of opinion as to what actually happened, to account for the centre span of the new Quebec Bridge failing to reach its intended location and finding instead a lodgment at the bottom of the St. Lawrence. The accompanying article, while not seeking to refute either superficially or ill-formed opinion, over-drawn theory, or excited observation, puts the matter of the "make-ready" of the centre span and its subsequent "hoisting to place" in definite, easily intelligible language, applicable more especially, of course, to the second effort to close the gap, but none the less pertinent to the first.*

**H**OWEVER welcome an opportunity, the lamentable disaster may have afforded the numerous critics of the "I told you so" class to express their "wise after the event" opinions, the fact remains that the span is not yet in position, and that, to insure

That the real actual cause of the accident is known to the parties concerned, is not doubted, but whether it be deemed judicious or desirable that such facts should be publicly discussed is a matter which rests between the builders and the Dominion Government.

arise from hastily formed opinion. If it be possible to calculate the strength of the completed structure, it is likewise possible to arrive at the necessary degree of completion which would enable the span to support its own weight, so that one may therefore assume that the

PONTOONS WITH CENTRE SPAN ABOARD BEING TOWED FROM SILLERY COVE TO THE BRIDGE SITE.

the safe and successful completion of the notable undertaking, the reason for the mishap must be authentically established, the contributory factors duly analyzed, and the necessary precautions taken to not only overcome the cause of the present trouble, but to foresee and forestall any other possible difficulty which may arise on the next occasion.

## Structural Completeness

It is known, however, that the greater portion of the main flooring, together with a large number of cross and diagonal stiffening members were not yet in place, it being the intention to erect these after the span was elevated into position. Such a procedure does not, however, merit such criticism as might

span was quite capable of being supported on four points as was done. That it was compatible with safety to leave off the most of the main flooring will be admitted by structural engineers, as, until the span was elevated and the ends of the main side girders permanently built onto the cantilevers, such flooring construction would have constituted a

PONTOONS WITH CENTRE SPAN ABOARD BEING MOVED INTO POSITION FOR LIFTING OPERATION.

purely dead load amounting to 500 or 600 tons of material, with no resultant strengthening of the structure.

Consideration of the manner of sling-

according to all available accounts, that not only did one point of support give way, but that its giving way was to some extent due to local distortion.

introducing intricate calculations, let the reader picture one end of the span having a vertical velocity of 1.25 inch per second, imparted to it from a

CENTRE SPAN MOORED AND READY TO BE LIFTED FROM PONTOONS.

ing the span raises the question of the desirability of localizing the load on four points as was done. The span is designed to be built onto the cantilever ends so as to form a continuous fabric, and the additional support derived in

FIG. 1.

this manner may well impart the necessary strength to the span in position. While the span as a unit was doubtless correctly designed, so far as final conditions are concerned, it seems possible,

While being constructed and transported to the site, the span was supported by ideal methods. The three pontoons at either end offered a well distributed area of support which, by virtue of being water borne was capable of absorbing or preventing any undue shock to the span. Once the span was suspended by inelastic slings from the cantilever ends, the compensating effect of the water-borne pontoons was replaced by uncushioned suspension from four practically rigid points. Taking the builders' own estimates of the rate of hoisting, viz., 70 lifts of 24 inches in 16 hours, which equals 1 lift every 14 minutes, and allowing 4 minutes for changing and adjusting tackle at each lift, there remains the fact that it was intended to lift the structure at an actual velocity of 2.4 inches per minute, roughly 1.25 inch per second. Without

rigid support, so that in 5 seconds the end was raised 1.5 inch. Allowing the various members of the span to adjust themselves to the stress of the lift, it might or it might not be 5 seconds before the stress reached the centre of

FIG. 2.

the span, being at the rate of 64 ft. per second. Any adjustment which the parts of the span would tend to make would now be deprived of the diminishing effect of the pontoon support, re-

CENTRE SPAN COLLAPSING AND DISAPPEARING INTO RIVER AFTER HAVING BEEN LIFTED A FEW FEET

Copyrighted in Canada, Great Britain, and United States by Chesterfield & McLaren, Montreal.

sulting in still further increased stresses when resisted by the unyielding support of the hydraulic lifting jacks. It is only necessary to consider this cycle of stresses recurring every few minutes in a structure which had just undergone a complete change in system of support, to appreciate the possible conditions of the case.

#### Actual Cause of Accident

The casting which is stated to have failed formed part of a ball and socket support, one of which was at each of the four corners as in diagram Fig. 1. A failure at A if it actually took place would result in the entire weight being supported on the two diagonally opposite points B and C as the point D would only be balancing the weight of the structure now pivoted on two points. The complete reversal of strains in many of the important members resulting from this lack of support, following on the repeated stressing due to rapid elevation may quite well have been the undoing of the job. Such an occurrence may very naturally have been left out of the list of possible contingencies taken into account by the designers.

In the absence of a detailed statement of future intentions beyond the determination to build and place another span the suggestion is advanced that with proper safeguards in lifting, along with increased stiffening, the job will be completed safely. Safeguards include methods as well as appliances, and the advantages of using three points of support at each end merit consideration. As shown in Fig. 2, should the support at one corner fail, the area still supported would be more than half, and if emergency stiffening were in place the evil effects of the overhung portion could be safely neutralized until corrected.

#### More Rigid Test for Tackle

The statement attributed to officials that the span had been resting on the ball and socket supports for six weeks previous to erection is doubtless perfectly true, but in view of the difference between conditions during that time and those under which the span was being elevated, it is not possible to accept this as a fair test of the ability of the supports to stand up at the crucial moment. It would appear that the rigid slinging aggravated the stresses in a green girder which had not been allowed sufficient time to settle and adjust itself to a severe change in its method of support. Such adjustment undoubtedly reacted on the supports so that they were stressed in a totally unexpected manner. That such stresses were intensified by the rate of elevation seems more than likely, and in a case of this kind there is truth in the adage "The more haste the less speed." True it would seem to be that it is safe to make haste slowly and the

efforts of the builders to bring the undertaking to a successful conclusion will be none the less meritorious even if delayed by precautions against additional emergencies brought to light by the recent accident.

#### TRANSMISSION SAFETY—IV.

**I**N some plants arrangement is made whereby the man who oils the shafting comes early in the morning and does his work before the engine is started up. In some respects this is an excellent idea, but like every other method of doing work it has to be carried out in accordance with a definite and intelligent plan if accidents are to be avoided. The oiler should first report to the engineer that he is about to oil the shafting, and he should again report to him when he has completed his task; and the engineer should be instructed not to start the engine until he has received definite word from the oiler in person, to the effect that the oiling is completed.

The way in which accidents are likely to happen in connection with this program is fairly evident. The oiler, when he has finished his task, sometimes omits to inform the engineer that he is through and the engineer, having received no word when it comes to start the engine, does not know what to do. If he does start the engine he may kill the oiler, while if he does not do so he may be delaying the day's work quite unnecessarily. In one case that we have in mind the engineer made a practice of looking over the plant under these circumstances, to see where the oiler was; and he invariably found that he had gone away and forgotten to leave word. The engineer then returned to the engine room and started the machinery.

After having done this a number of times he began to take it for granted that the oiler had merely forgotten to bring him the message, and thereafter he started up at the regular time without taking the trouble to look through the shop. It is evident that when the thing is managed in this way there is a strong probability that sooner or later the machinery will be set in motion while the oiler is in a dangerous position, and he will be likely to be killed or badly injured in consequence. Hence it is of paramount importance, when this plan is adopted, to see that the oiler invariably passes the word to the engineer as soon as he is through with his work.

#### Protruding Dead Ends of Shafting

All protruding dead ends of shafting should be boxed in or guarded with wire mesh, unless they are more than 7 feet above the floor. All horizontal shafting and all pulleys that are not more than 7 feet above the floor should also be inclosed, or be guarded by standard railings at least 42 inches high, placed not less than 15 inches from the point to be

guarded. Safety couplings, collars and set-screws should be used in all cases. Take suitable precautions to prevent pulleys from working off at the ends of their shafts, and provide a clearance of at least 36 inches between every pulley and the nearest shaft bearing. If this is not feasible a screen guard should be located between the pulley and the shaft bearing.

#### Projecting Keys

Another source of danger to workmen who are oiling or repairing shafting or pulleys is the projecting key, which causes more trouble than many of the larger parts, though it often escapes notice on account of its small size. The danger is, that the key will catch a workman's clothing, cause the cloth to wind up around the shaft, and whirl the man around and seriously injure him. All projecting keys should therefore be effectively guarded. These precautions should be taken not only in the places where the men are most frequently required to work, but also throughout the entire plant; because the men, when called upon to do repair work in out-of-the-way or cramped quarters, are likely to forget that the dangers are not guarded there as well as in other places. It is hardly more dangerous to leave them all unprotected, than it is to give a false sense of security by attending to only a part of them.

A competent mechanic should be assigned to the work of inspecting the power-transmission equipment, and he should examine all parts of it carefully and at regular intervals. Such inspections often disclose dangerous conditions.

#### OIL RING BEARING TROUBLE

**THE** oil ring in a motor bearing failed to turn because it had been distorted into an elliptical shape by a crowding which it had received when the armature had been reinstalled after having been removed for repair. When an armature shaft is shoved into a bearing, the oil ring should be held up with a screw driver or other article of suitable shape. Assemblers accomplish the same result by turning an end shield upside down, for then the ring drops out of the way. Some operators lift the rings and rest them on the boss alongside the ring slot; this is not to be recommended as a general practice for the rings may be forgotten and remain raised out of the oil. Indeed, this has been found to be the cause of trouble in several instances of bearing heating. In these cases, however, the bearing was so inaccessible that only an experienced hand could locate the ring by feeling for it. Another very similar instance took place when a motor had to be disassembled on account of having been through a flood; in reassembling, the rings were left out entirely.

# Evolving Standard Cutting Tools After a Definite Plan--II.

"Herbert's Monthly Review"

*This series of articles dealing with the practical side of the subject of cutting tools may be said to be supplemental to what appeared in our issues of July 20 and 27; cutting tools from the theoretical and analytical viewpoint were then discussed. As efficiency in the machine shop depends largely on the character of the tools used, it is believed to be easily worth while for those concerned to not only sift this tool question to its fundamentals, but for each individual shop to establish a standard tool scheme to suit its own special conditions.*

**C**ONTINUING the discussion of standard tools from our September 14 issue, it is to be noted that Nos. 2 and 3 have a similar profile to tool No. 1, the difference lying in the rake of the top face. This has side as well as front cutting angles, so the tools can only be used for feeding in one direction. These are general purpose tools for right and left-hand rough turning, though they are preferable to No. 1 for shaping and planing steel when the feed of the tool is in one direction only.

The tools are shown in the chart with

both sides rounded, this being the form most suitable for ordinary purposes. Where they are used for heavy roughing in preference to tools Nos. 4 and 5 (this, however, is not recommended), the rounding of the non-cutting side can be left out, the end of the tool being ground off at 80 degrees "back" and 6 degrees clearance, No. 2 tool being ground with the top face upwards, and No. 3 with the top face downwards. This agrees with the axiom that for heavy cutting as much metal as possible should be left on the tool nose to absorb the

heat, but will only apply to tools of larger section than, say,  $\frac{3}{4}$  in. x 1 in. Generally speaking, these tools should be made of steel with a depth about one and a half times its width, though for some small American lathes it will be found necessary to employ a section of two to one. Grinding instructions as for tool No. 1 will apply, with the exception of grinding the top face.

**Grinding Instructions.**—When grinding these tools with a hollow-curved top face, they should be set in the attachment at an angle of 30 degrees with the slide, as this setting makes the curvature run away from the cutting edge in a manner suitable for all ordinary purposes. On small tools, to be used only for light cuts, this angle can be decreased with advantage to 20 or even 15 degrees. When the non-cutting face is not rounded, the settings to be used, instead of those given in the chart, will be:

	Turn- table	Trun- nion	Tool- holder
Tool No. 2, Op. 2.	80 back	6 up	A zero
Tool No. 3, Op. 1.	80 back	6 down	C zero

Tools Nos. 4 and 5 are those strongly recommended for nearly all rough turning and planing. They adapt themselves so readily to the most efficient form for cutting all kinds of materials. On the standard tool chart, the form of tools given are those suited for general work, but full instructions will be given for arriving at the form most suitable for definite and particularized conditions. The cutting edge numbered 1 in the diagram can be ground to any angle from 5 to 55 degrees, and can be made of any length, according to the depth of cut. The variations to which these tools are subject are given in the diagram and chart, Fig. 3, with the kind of work for which each is suited.

The cutting edge, whatever the form and rake of the tool, must be approximately horizontal, and in Fig. 3 the angles specified ensure this. For those who are interested in knowing the means whereby the various settings for the rake angles suited to different materials are ascertained, the following formula and its explanation may be cited: Refer to Fig. 4, which shows a tool with the cutting edge at A degrees to the side of the tool. The line pz drawn in a horizontal plane at right

FIG. 3. CHART SHOWING VARIATIONS OF TOOL NO. 4, WITH THE SETTINGS NECESSARY TO GIVE EACH SHAPE AND THE CLASS OF WORK FOR WHICH EACH IS SUITED.

angles to the cutting edge gives the rake of the top face as B degrees, shown in triangle z pl; then a vertical line from horizontal line pz to the top face is zl. The horizontal lines zm and zn are drawn perpendicular to and parallel with the side of the tool: then the angles which these two lines make with the top face are respectively the side and the front cutting angles, which can be set on the Lumsden machine by means of the tool-holder and turntable adjustments.

Thus angle F, the front cutting angle, is also determined in terms of angles A and B. The same problem can be solved

FIG. 4.

graphically by drawing the diagram (Fig. 4) to the correct angles, then measuring angles S and F with a protractor to the nearest degree. Nos. 4 and 5 tools should have shanks of sections with a depth one and a half times the width.

Grinding Instructions. — The tool blank needs no special setting in the

with 6 degrees clearance, setting to the desired radius by means of the radius gauge and carefully noting the position of the centre of the tool width, in order to offset the tool correctly. One point that should be rigorously watched in making these tools is that the cutting edge must be long enough for any depth of cut it may be called upon to take, while at the same time it should not be made any longer than is necessary.

Tools Nos. 6 and 7 are precisely the same in principle as Nos. 4 and 5. They are bent for the purpose of reaching outside the tool rest in those cases where

No 1 - Shaping				
SETTINGS for Curved Face.		TOOL	SETTINGS

The lines zl, zs and zt are all equal, as they represent the vertical line from point z to the tool face. Call them r, then

$$r = \text{pz Tan } B.$$

$$r = \text{pz Tan } B \dots\dots(1)$$

$$r = \text{pz Cos } A \dots\dots(2)$$

$$r = \text{pz Sin } A \dots\dots(3)$$

$$\text{Tan } S = \frac{r}{\text{pz}}$$

$$\text{Substituting (1)} = \text{Tan } B.$$

$$\text{Substituting (2)} = \text{Cos } A \text{ Tan } B.$$

Thus angle S, the side cutting angle, is determined in terms of angles A and B, which are known.

$$\text{Tan } F = \frac{r}{\text{nz}}$$

$$\text{Substituting (1)} = \text{Tan } B.$$

$$\text{Substituting (2)} = \text{Sin } A \text{ Tan } B.$$

holder beyond the elementary one of placing the base of the blank flat on the bottom of the holder. Grind side angle 1 to the requisite inclination of the cutting edge, then turn the tool over and grind front angle 2. In a small tool or one to be used for light cuts only, make face 1 quite short, and grind face 2 till it almost joins it. When grinding a curved top face, the cutting edge, whatever its inclination, must be set parallel to the attachment slide. The setting of the machine toolholders is given as A.20, right or left—this is correct for most tools. Very small tools can be ground with the slide set nearer the vertical, while for very large tools, the angle can be increased to, say, A.30, beyond which it is not desirable to go.

The point of the tool can be radiused by hand, though, if desired on large tools, it can be rounded on the machine,

No 6 - Bent Roughing R.H.

the saddle cannot be brought close enough to the work to employ a straight tool. The blank should be bent to an angle of 45 degrees. As the use of bent roughing tools is limited to special and but few cases, it is not necessary to consider variations in its angles, as the expense of providing tools with the possible variations would not be justified. Generally speaking, any variation desirable can be obtained by inclining the tool in the tool rest. A section of 1 to 1½ will be found generally suitable for this tool.

Grinding Instructions.—These will be generally as specified for tools Nos. 4

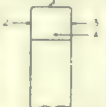

No 8 - Narrow Finishing R.H.

and 5. The rake of the cutting edge can be varied to suit different materials, the angles given for the top tool but one in Fig. 3 being all the variations necessary.

Tools Nos. 8 and 9 are intended for fine finishing cuts on lathes, planers or shapers. Sides 1 and 2 are ground with clearance, so the corner between them should always be the leading corner. These narrow finishing tools will rarely, if ever, be used in the larger sections; on the other hand, the broad finishing tool, No. 10, will rarely be used in the smaller sections. Theoretically, the width of the cutting edge should be about twice the intended feed, but as

N°10 - Broad Finishing					
SETTINGS		TOOL	OPERATION	SETTINGS

					A6 Left
					D Zero

this cannot be readily determined, it will prove a good rule to make the cutting edge half as wide as the tool shank. These tools will give the greatest satisfaction if made of a section having a depth twice the width.

**Grinding Instructions.**—First grind the end of the tool, this being the cutting edge, giving it 6 degrees of clearance. The front edge of the tool can next be thinned down to half the width of the shank by grinding off at 25 or 30 degrees with the side. For cutting steel, it is strongly recommended that these tools be ground with hollow curved top faces, the tool being set in the attachment at right angles to the slide, top face turned towards the wheel. The toolholder setting of A.15, right, will give the right amount of curvature for all tools up to  $\frac{3}{4}$  in. x  $1\frac{1}{2}$  in. Larger tools can be ground at a toolholder setting of A.20, right. For cutting cast iron, a flat top face with 10 degrees rake is best; this is obtained with settings for operation 4 of

Turntable. Trunnion. Toolholder  
10 Fore. Zero. D Zero.

Tool No. 10 is a broad finishing tool, and will generally be made of square section steel,  $1\frac{1}{2}$  in. x  $1\frac{1}{2}$  in. and larger.

N°11 - Recessing					
SETTINGS		TOOL	OPERATION	SETTINGS	
ATTACH-MENT	TOOL-HOLDER			TURN-TABLE	TRUNNION
ZERO	A15 Right		1	90 Back	6 Up
			2	5 Fore	ZERO
			3	3 Fore	ZERO
			4	15 Fore	ZERO
					TOOL-HOLDER
					A Zero
					C3 Right
					A3 Left
					D Zero

This tool will be generally more used for planing than for shaping or turning. Its long cutting edge makes it suitable for the very coarse feeds used in finish planing.

**Grinding Instructions.**—Grinding instructions are generally similar to those given for tools Nos. 8 and 9. Sides 2 and 3 are, however, both ground with

clearance, so that the tool can be fed in either direction. For cutting steel it should be ground with a hollow curved top face. For cutting cast iron, it should have a flat top face with 10 degrees of rake, the settings for operation 4 being

Turntable. Trunnion. Toolholder.  
10 Fore. Zero. D Zero.

Tool No. 11 is for a special purpose, namely, feeding straight into the work to cut a recess. Such a tool is often used in narrow form for cutting the recess between different diameters on a turned shaft, and in broader form for the first operation in planing tee slots from the solid. As this tool cuts more or less deeply into the work, both sides of the tool are given a side angle of 3 degrees, in order to clear the work. The section of steel used will depend entirely on the width of cutting edge desired.

Grinding instructions are practically the same as those given for tools Nos. 8, 9 and 10, viz.: Grind the cutting edge first, then the two sides to give a definite width of cutting edge, and lastly, the top face. The two sides are ground with 3 degrees of clearance in addition to the 3 degrees of side angle. For cutting steel, a hollow curved top face is strongly recommended, but for cast iron the top face should be flat and have 10 degrees rake, the settings for operation 4 being

Turntable. Trunnion. Toolholder.  
10 Fore. Zero. D Zero.

### TUBE FIXING IN WATER-TUBE BOILERS

SOME failures of Stirling water-tube boilers reported upon in two recent British Board of Trade reports, Nos. 2,405 and 2,406, show that the importance of securely fixing the ends of the tubes in the tube plates is perhaps not sufficiently appreciated by makers of this type of steam generator. It is common practice in boilers of the locomotive and Scotch multi-tubular type to fix the tubes by slightly expanding the ends into parallel holes in the tube plates, and when the design is such that the tube plates are held in position by stays or other attachments which make their rigidity independent of the holding power of the tubes, little exception can be taken to this method of fixing, for then, in the event of a tube working loose, nothing beyond leakage can occur. It is seldom of course, that even in these designs the stiffness of the tube plate is entirely independent of the holding power of the tubes, and if this becomes defective over a large area there is risk of the plate being bulged and forced over the tube ends.

In water-tube boilers of the Stirling and similar designs in which the lower drums are suspended from upper steam drums by groups of tubes, there are no stays to connect the drums and nothing

to resist the tubes being forced out beyond the holding power of the tubes themselves. In commenting on the case, the chief engineer-surveyor to the Board of Trade calls attention to the excessive stress which tubes in this type of boiler have to bear, owing to the considerable weight suspended from them, and to the importance, therefore, of bell-mouthing the ends of the tubes to diminish the risk of the tubes being forced out of the tube-plate.

### Local Overheating of Tubes

It should be remembered that in boilers of the type under notice the working conditions are rather trying to the tubes. They have not only to carry the load of the lower drums when filled with water, but are directly exposed to the intense heat of the fire and furnace gases which cannot be uniformly distributed, and, therefore, gives rise to racking stresses from differences of expansion. Obviously these are aggravated if the feed water is not good and incrustation accumulates near the tube ends, as local overheating is then set up. This, in fact, proved to be the precipitating cause of three failures in the course of three weeks in the case of one of the reports quoted, viz., No. 2,406, and emphasizes the importance of a water-softening plant in connection with water-tube boilers whenever the feed water produces scale in objectionable quantity. Grease is even more objectionable than scale, as the merest trace with some kind of feed water is sufficient to cause overheating, and, it may be added, is very liable to get introduced where surface condensation is practised unless great care is exercised in the lubrication of the engine and the separation of the oil from the exhaust steam.

### RUBBER BELT DRESSING

BEFORE applying dressing to a rubber belt, if you have the right kind to apply to that material of belt, brush the latter off thoroughly with a brush that will find the bottom of the dust, then, with a brush or suitable cloth, apply the dressing to the full width of the belt—not in the centre. Remember that the dressing should not be put on so heavy that it causes the belt to incline to follow the pulley and only releases when forced to by natural causes, and then makes a terrible crackling noise when it does let loose. In seeing a belt follow the pulley and hearing the crackling noise in its tearing loose, one must certainly understand that there is not only an unnecessary strain on the belt, but that it is bound to take considerably more power. I have seen rubber belts that had the outer ply of rubber torn off by this practice. The dressing suitable for a leather belt, is pretty apt to rot a rubber belt.

## GAS LEAK AND AN OPEN TORCH.

By J. H. R.

THE old adage of looking for a gas leak with a lighted match, has often been related—not always by the unfortunate explorer,—but by those who desire to warn others against embarking on a like enterprise. The original source of this article, not being of the ordinary gas leaking variety, may be of interest to the readers.

Some few years ago in a small jobbing shop, a number of special design internal combustion engines were being constructed, and when completed, were subjected to the usual test. During the operation of testing one of these engines, the charge refused to explode. After turning the engine over several times without success, the caps were removed from one of the valve seats, to try and locate the cause of the trouble. The operator, who was an experienced hand on gas engines, stooped down to investigate, but being rather dark, he called for a light. The light, which was an open flame torch, was handed to him, and unthinkingly he placed the light to the valve opening. The result, like the cellar explorer, was a gentle explosion, which centered itself in the face of the torch bearer, causing some serious burns, and the loss of his eyebrows and moustache; the latter being the most serious of all, as he stated himself he had been seven years in raising it.

## THE ELUSIVE ELEMENT OF SUCCESS.

By A. L. Haas.

THE most elusive quality of merit in the mechanical business, difficult to analyse and upon whose value too great an assessment can scarcely be placed is that termed initiative.

Study, training and experience do not alone evolve it, when the psychologist attempts its explanation, he seems to make confusion worse confounded. In actual practice the individual having this quality strongly marked is certain to be deferred to in time of crisis or when things go awry, it is therefore understood although more or less inexplicable.

There is no other business extant giving the same opportunities for all ranks to exercise and develop initiative as that of the engineer in whatever subdivision of the mechanical field he hap-

pens to be located or whatever his position.

Like every other ethical sense or mental quality it gains by experience training and knowledge in fact destitute of these it is by no means a striking or uncommon quality, developed highly in a narrow or limited sense it becomes of the greatest possible value.

Like wisdom it is more or less a birth endowment, many labourers have it, many mechanics lack the quality—in the sense indicated it is a native and not an acquired trait of character. It has nothing to do with verbal memory or examination success, knowledge is its tool not its master, in the larger fields of human effort and for success in any real sense it is indispensable.

## Truth Will Out

We are all acquainted with individuals who in place of knowledge and initiative, substitute bluff or its modern variant swank. These folk have their day and cease to be, the ring of fine gold cannot be imitated for long not at all events to a trained ear; some quite small matter it may be reveals the sham and the counterfeit of their profession stands revealed. Sometimes the survival is for a period until the retribution, just and long overdue produces a sign of relief from below from those who realised but were unable from their positions to protest effectually.

Cutting and contriving, presence of mind, power to diagnose, to visualise, to substitute, to apply a remedy, all matters needing courage, are the fruits of initiative.

The tricks of the trade, tool using ability, power to repeatedly perform operations learnt are not initiative, they are common possessions enough.

No firm may neglect the quality and live, no concern play the role of simple imitator for long without suffering the penalty. Get a reputation of being always after the fair and the centre of gravity of business will assuredly shift disadvantageously.

In a business sense, the formulation of policy, opening out new fields of effort, good correspondence, purchase, dealing with complaints, instalment of new plants, courage to scrap the old, are all apart from simple clerical or technical ability and are obviously matters demanding initiative. In ordinary times with ordinary conditions the value of being in front is realised, in actual war-

fare belligerent or industrial it is the winning side which can afford to take the initiative.

The quality cited means keeping in the forefront of evolution not merely swept up with its final wave. Adjustment in front is preferable to hasty re-organisation when it becomes evident that the penalty for conservatism is about to operate.

The conditions which have existed for the past two years and more especially those which are yet to come, represent a unique opportunity. Never in the annals of mankind has the necessity for foresight been at a greater premium, never since the first engineer started in business has there been a more urgent need for the exercise of every human and mental endowment opportunity of similar magnitude will not occur again for perhaps a century. The re-construction which the greatest war in history has necessitated leaves the greater question still of reversal to normal manufacture yet to come. This will afford opportunity commensurate with the occasion and the magnitude of this needs to be grasped.

To initiate re-commencement, to be more than ready to take the commercial field again, to be equipped knowing where to begin and what to do will mean the difference between the front and the rear of the procession. The question of success or failure may hinge on what is now being prepared. If the war has emphasised one thing it is that organisation is the soul of the offensive which in turn depends upon the initiative taken.

## The Campaign of Peace

The re-adjustment will be immense, the national task stupendous. There will be as much opportunity for big things at the resumption of the usual as there was at the commencement of the unusual period now past, which we all hope is drawing to a close. Values have changed, ideas have altered, a new and immense future awaits exploitation; to take advantage of the same will require acute intellect, realisation of possibility, preparation, foresight, indeed every variant of the general quality initiative will be severely exercised. Peace when it comes will be a commencement not a finish; another and most serious campaign, for which it is hoped the plans are in preparation, will commence in a

changed world, having different values and fresh economic conditions.

The squandered wealth and loss of production needs restoration, it will need long and laborious work, strenuous days and months of effort to make the national machine run smoothly and efficiently. If we are to regain our previous footing, earn our former industrial status it will call for every ounce of effort in the forthcoming trial of strength. We have shown that we can adapt ourselves to the needs of war, put aside carefully guarded privileges and prejudices under the iron spur of national need. Are we also going to throw the same effectual strength into the trade war coming and regain not simply destroyed wealth but trade prestige. To do this depends upon the present in no small measure, equal sacrifice will be needed, are we prepared to make it? The matter does not rest with Committees, however representative and capable, nor with the Government, it rests individually upon every single unit in the mechanical world, where international competition is most easily realised and will make itself more keenly felt than in almost any other quarter.

The engineering and manufacturing resources of the world have increased at an unprecedented rate just recently, this increase will continue in the near future, our very sacrifices have built up rivals in neutral countries where expansion has been almost as great as here. As a consequence long views must be taken the conditions must be anticipated otherwise a large slice of our export trade will be permanently alienated and our sacrifices vain.

It is not merely a question for managements, it is equally important that the facts are realised by rank and file, the responsibility for the future rests as much with foremen, mechanics, draughtsmen as with the commercial and direction sides.

When normal conditions are resumed the first phase will be a busy period making good quantities of work in arrears; re-construction of destroyed material and overdue repair must make employment good. The larger the catastrophe the greater the wreckage and the larger the amount of work involved in simple clearance. After this first period will come the re-action, the lull of stagnation and slackness.

It is this portion of the future which will prove troublesome, difficult, dangerous.

It is then that initiative commencing now will count; count as initiative never counted before nationally, commercially, technically. The resources are here, the national spirit is here and careful hands may steer safely

through. It will however tax all our faculties and leave us all less leisure to re-establish stable conditions of industry, in which labour and capital are equally interested. Most state interference is brought about by default or oppression. A good employer usually has met outstanding factory regulations before they are made. While it is certain that the exact conditions existing before the war will not be re-established, the alterations necessitated may cause less trouble if the conditions be given due thought ahead. It rests altogether on the initiative and national conception of all concerned to place this country in the position of industrial pre-eminence she formerly enjoyed.

There is no cause for pessimism but much cause for mental activity; not when the re-start is made but at the present moment all hands should be busy that the shock when it comes may be softened and the conditions which have prevailed universally after a great war be more or less averted and provided for.

THE French army steel helmets are stamped out of the best half-hardened sheet steel, about 1 mm. thick, according to the Bulletin des Armees. Four pieces make up the helmet: The cap, the peak, the neck protector, and the crest, and they are riveted together and sprayed with a gray-blue paint to prevent rust. After drying for some hours at 135 deg. Cent., the helmet is lined and fitted with a chin strap.

## MACHINISTS' INSTRUCTION COURSE—III.

By J. Davies.

**T**HERE are special machines or attachments made for grinding drills, which give better results than can be expected from hand grinding. By far the greater number are ground by hand, however, so that hand grinding is a very necessary accomplishment. It is usually done by holding the drill on the side of the emery wheel, as shown in Fig. 13. Start grinding at the cutting edge and turn the drill round in much the same way as it turns when working. Take care not to turn the drill too far round or you will grind the cutting edges off the opposite side. Copy from a new drill. Grind to gauge until you become proficient, then you will be able to do without gauges, depending only on the eye for the angle and shape of cutting edges.

### Speed and Feed of Drills

The speed of a drill and the amount of feed for revolution can only be determined by the man on the job, depending as it does upon so many conditions, i.e., the hardness of the material to be drilled, the nature of the job, the quality of the drill, the depth of the hole, etc. It is impossible to give a rule to cover all cases; therefore, the correct cutting speed must be determined by good judgment. It is safe to start drilling with carbon drills at 30 ft. per min. for machinery steel, 35 ft. for cast iron, and 60 ft. for brass, using a feed of about .004-inch per revolution for small drills up to about  $\frac{3}{8}$  in., and a higher feed up to

ILLUSTRATING VARIOUS TYPES OF DRILLS AND CUTTERS.

about .010 for larger drills. These are only trial speeds, from which the correct feed and speed can be obtained to suit the job. I am indebted to the Cleveland Twist Drill Co. for the following table of cutting speeds:

old round file and get it well magnetized; the electrician or engineer will do the latter for you. Insert the file into the hole, and it will come out loaded with chips, a slight tap knocking them off each time.

latter are made in different forms, being known as solid reamers, adjustable reamers, shell reamers, etc.

The following lubricants used in drilling have been found to give good results:—Hard steel—turpentine; soft steel—lard oil; malleable iron—soda water; aluminum—soda water; brass and cast iron—cut dry.

The size of drill for tapping or clearance holes for bolt is rarely given, so that it is very essential for the drill hand to know them for himself. No one ever thinks of having to do any figuring to find the size of drill for any tapped hole. There are two ways of procuring it, either to consult a table or chart, or learn the sizes by heart; the last is by far the best. The most fruitful source of broken taps is making tapping holes too small.

#### Drilling Deep Holes

In drilling very deep holes, it is sometimes necessary to drill deeper than the flutes of the drill, the trouble being, however, to get rid of the cuttings; sometimes it is necessary to drill with a smaller drill, after drilling as far as you can with that of the proper size.

There are other kinds of drills used beside the twist drill. We have the flat drill, generally made by the shop blacksmith, by simply flattening the end of a piece of round steel and grinding to size and shape, as shown in sketch, Fig. 14. Be careful to leave it a little parallel for a short distance equal to the full size of hole. Another variation of the flat drill is the teat type, Fig. 15, which is ground with a flat bottom except for the little teat left on as a guiding point for the drill. It is used for making a flat-bottomed hole, or for spot facing a flat spot for a nut or bolt head.

A pilot drill is a very useful tool. It is made of various forms, the chief characteristic being that of its having a round pilot turned on the end to suit standard size drills. Some pilot drills are made with four cutting edges, and some with only two, Fig. 16. They are employed for countersinking, counter-boring, and for enlarging small holes where accuracy is desired. Perhaps their most useful feature is the drilling of a hole on an inclined plane, the pilot preventing the drill from running to one side. A small hole is first drilled the size of the pilot.

Drilled holes are not always true, smooth, or of the exact size; therefore, when a hole is required to be very smooth and accurate, a reamer is used. The

6	2 1/4	5 1/2	5.423

N.B.—The difference between the English or Whitworth standard of tapping sizes and the U.S. is so small that for all practical purposes the same tapping size can be used up to 2 inches.

In using a reamer, drill to within 1-64 in. of size for small holes, up to about 7/8 in. and to within 1-32 in. for holes larger than 7/8 in. Taper reamers are used for finishing holes for taper pins. They have a much heavier duty to perform than straight reamers; it helps, some however, to drill the hole to the centre the size of the centre of reamer, or of that part of reamer that comes to the centre of the hole.

#### HOT BEARING EXPERIENCE.

THE test of years in practice has proved that the oil ring method of lubricating bearings is entirely satisfactory, says E. C. Parham in the General Electric Review. Although it is seemingly obvious that the following precautions should be taken, past experience has shown that it is necessary to call attention to the facts that (1) there must be oil in the oil-well, (2) the oil rings must be installed, and (3) the oil rings must turn.

Complaint was made that the lining in one bearing of a motor armature had melted twice, notwithstanding the fact that the oil had been renewed just as often as had that of the other bearing which had given no trouble. The motor, being started and stopped by means of an automatic panel and being almost inaccessible, was not given daily attention. It would operate for about five days and then the bearing heating would produce a binding effect which

MACHINE SCREW TAP SIZES.

		48	42

You will probably have to back the drill a few times and clean the hole out the best way you can. Some get a piece of tin and roughly make a scoop or spoon; others try a blow pipe, particularly for cast iron. The best way is to secure an

would cause the motor circuit-breaker to open. The opening of the breaker was all that prevented the babbitt metal from running out and letting the armature down onto the pole pieces. An inspector, who was sent to locate the trouble, noticed that the floor was much more oily under the trouble-giving end of the motor than at the other end. This suggested that the oil flooding could not have been due altogether to careless oiling, for then the flooding at both ends would have been about the same. Inspection of the oil-well showed that there was but little oil in it although the other bearing was nearly normal; both bearings had recently been washed out and refilled. On refilling the oil well and carefully wiping the outside of the box, a crack was discovered through which the oil slowly oozed out. This was stopped by drilling, tapping and plugging a hole in the affected area.

### BEARING METALS—BABBITT

THE best combination for bearings is to make the wearing parts of one of a material softer than the other. No doubt the good effects resulting are due to the fact that the softer material yields somewhat to the inequalities of the harder metal, and this giving way of one of the metals permits of easy running. Conversely, the hard, unyielding surfaces of steel on steel have exactly the opposite effect, as neither will give in to the other, and friction naturally follows, causing heating, which again increases the friction until failure occurs.

Within certain limits the more accommodating the soft bearing the better the result obtained, the material generally employed being what is known as "white metal," or "Babbitt," from the name of its originator. This white metal is an alloy of several metals, the proportions varying according to the results desired. Nearly every shop has its own formula for the mixture, but a typical one may be taken as 73 parts of tin, 10 parts of antimony, and  $4\frac{1}{2}$  parts of copper. These are melted together in the foundry and supplied in blocks to consumers who heat it to a molten state for use, adding thereafter some  $12\frac{1}{2}$  parts of zinc to it. The parts mentioned are by weight.

It is very important that the white metal should be well supported by another metal possessing more strength, as, unless reinforced in some way, it would be crushed and deformed. For instance, in journal boxes it will usually be found good practice to cast the bearing area with recesses in the face, into which the white metal is run, the whole being then turned up with the axle, so that the actual bearing face is partly bronze or cast iron, but more largely white metal. In some cases it is possible to make one

of the wearing faces entirely of white metal, in which a very thin layer is attached to the harder metal. Even in such instances, however, it will be found best to provide for the harder metal to project all round the Babbitt, to prevent the edges breaking off. At least some form of "key" will be necessary, such as serrations in the hard metal holes in which the white metal can penetrate and get a grip.

### The Tinning Feature

The problem of attaching the two metals together is one that the operator must effectually solve, as on the success of his workmanship rests the whole responsibility for good results to be obtained in the after-work of the engine or machine when running. The article to be Babbitted must first be thoroughly cleaned from scale or rust at those parts which are required to be lined up. This cleaning is done either by mechanical means such as turning, filing, or chipping, or by chemical means of immersion in an acid bath. The latter method is preferable, but not always possible, so the former is often met with in service. It depends also upon the metal of the part to be lined up, as if this is cast iron it is more difficult to make the white metal adhere to it than if it is a metal more nearly akin to the white metal, such as bronze.

When the surfaces are thoroughly clean, the article is heated to a temperature sufficient to make tin melt freely, say 450 degs. F. Then a stick of tin is dipped in sal-ammoniac and rubbed on to the parts to be metalled, a very thin coating being deposited. This operation has to be carried on until the whole surface is covered with a layer of tin, and is necessary in order to ensure that the white metal is in firm metallic contact with the article to which it is required to be attached. If no previous tinning were done, the white metal might stick, or it might not, and failure would be probable in the after-working processes or in service. The babbitt is afterwards poured on to the tinned parts, and guided and pressed into position by means of a hard smooth stick of wood. Whilst in a plastic state the Babbitt is easily controlled, and a layer of almost any thickness can be spread on to the skin of tin, to which it will firmly adhere.

A DUTCH periodical, "In en Uitvoer," states that in Holland complaints about the quality of German pig iron are daily growing. This deterioration is apparently due to a shortage of skilled workmen and an insufficient quantity of manganese. The substitute for manganese, of which the discovery was recently reported in German papers, does not seem to have come up to expectation.

### COMPUTING VALUES OF TUNGSTEN LAMPS.

IT is well-known that a change in the voltage applied to the terminals of an incandescent lamp changes the candle-power, current and, in consequence, the wattage (watts=volts  $\times$  amperes), and the watts per candle. If these changes are followed from point to point, relations among the variables may be found and plotted as characteristic curves. The equations of these characteristic curves for tungsten lamps have been found by the Bureau of Standards of the United States Department of Commerce, and a special application of these equations has been made in a device which gives a solution of problems involving voltage, candle-power, and watts per candle.

In this device the volt scale is movable, and, by setting it to the other scales at a point corresponding to the observed watts per candle, values of per cent. candlepower and of actual watts per candle may be read directly from the proper scales, or the converse problems may be solved. Use of this device results in a decided saving of time when compared with other methods of characteristic evaluation. In connection with the device are given tables of values used in its construction and practical examples illustrating scale settings.

### STRENGTH OF GEAR TEETH

WHILE the exact load that should be transmitted by a pair of gears is a matter that requires considerable judgment owing to the many variable conditions involved, the experience of engineers and manufacturers have demonstrated that reliance can be placed upon Lewis' formula for the strength of gear teeth. This formula takes into account the shape of the teeth for different numbers of same and the effect of velocity upon shock and wear, as well as the face and pitch of the teeth. The Lewis' formula referred to is  $W = s p f v$ , from which

$$s p f v, \quad \text{Horsepower} = \frac{33000}{v}$$

where  $W$  = total pressure in pounds along the pitch line.

$s$  = working fibre stress (in lbs. per sq. in.) of material used in gears, corrected for velocity effect.

$p$  = circular pitch, inches.

$f$  = face width, inches.

$v$  = tooth strength factor, from curve.

$v$  = velocity at pitch line in feet per minute =  $\frac{P N R}{12}$

where  $N$  = number of teeth.  
 $R$  = revolutions per minute.

and Ideas Evolved from Actual Practical Application and Experience

## QUICK-ACTING AUTOMATIC SHELL CHUCK

By C. F. Whyte.

**T**HE chuck shown in the accompanying illustrations is applicable to shells from 4 in. dia. upwards,

FIG. 1—SECTION AND END VIEW OF AUTOMATIC SHELL CHUCK.

and was originally designed for 4.5 in. H. E. Howitzer shells. The first chuck made in the shop ran continuously for six months, averaging 10 shells per hour with a record of 160 in 12 hours, single cutting tool on heavy engine lathe feeding 1-16th in. per revolution.

The features of this chuck may be summarized as follows: Its action is "quicker than air"; positive drive avoiding slippage; operator need not stop lathe to remove and replace work; no wrench or hand wheel necessary; great freedom from repair; being smaller than shell affords ample clearance; its short length enables the projection of the tail stock sleeve to be reduced to a minimum; no excessive end thrust

spindle, and the other end is threaded to receive the chuck stem or arbor. The stem is formed with eccentric flutes seen in end view, each one having fitted to it a driving jaw, the three jaws being maintained equidistant from each other

by a sleeve with slots in it, and retained in the slots by a wire spring fitting into grooves on the outside of the jaws. The inner end of the sleeve is flanged and slotted for a wrench in case of emergency. By moving the sleeve in either direction the jaws expand or contract.

To remove a shell, run back the tail centre, when the long overhang of the heavy rotating billet loosens up the job and collapses the chuck when the shell readily slides off, while receiving a slight left hand turn from the operator to prevent jaws gripping again. The same turn is necessary when putting on a fresh forging, as it allows the forging to get right onto the chuck instantly.

The satisfactory working of the chuck is largely due to the filler piece, Fig. 2, which provides a rolling joint support underneath the jaws and maintains full contact with the curved surfaces of the flutes, preventing the formation of ridges or undue wear at spots by the large amount of surface always in contact.

## SAFETY ATTACHMENTS FOR TRUCKS.

By J. E. Cooley

**T**HERE is this about safety work that it leads one to discover sources and places of danger that would otherwise remain unknown until an accident therefrom arrested attention. In the pursuit of safety work, there is developed, what might be called a "safety faculty", or, in other words, the power of observing where danger really exists.

To speak more plainly still, one develops a knack of seeing danger possibilities wherever these lurk. Such a danger as described is found to exist in the use of trucks, the two and the four-wheel kind used so extensively for transporting work about a factory. Many accidents can happen and have happened through the careless manner in which these are left about, especially as they stand or lie in machine aisles or dark passage-ways, where they are stumbled over, or as in the case of the two-wheel kind, when placed upward against a wall or post, through their rolling out and remaining unseen until someone trips over them.

The accompanying sketch shows safety attachments that can be applied to these two types of trucks, and will prevent many accidents that would otherwise

happen without them. On the first of these—the four-wheel truck, is shown a latch attachment for keep-

FOUR-WHEEL TRUCK WITH HANDLE LATCH.

ing the truck handle up out of the way when not in use. It consists of a forged strip of steel as A, having a hook or

TWO-WHEEL TRUCK WITH ANTI-TIPPING SUPPORT.

nose bent on one end which is held to the truck proper by a screw on which it swings. A spring B is fastened to this which holds it against a stop pin C. When the handle is lifted up, it

HARDENED STEEL JAW

HARDENED STEEL FILLER PIECE

FIG. 2—DETAILS OF DRIVING JAWS.

is required to keep shell tight.

A section of the complete chuck or driver is shown in Fig. 1. One end of an adapter is threaded to suit the lathe

forces the latch over to one side, closing and locking the handle as shown. The handle is self-releasing, for, when pulling it down, it forces the latch out again sidewise.

On the two-wheel truck is shown a support or prop attached to the side and used for the purpose of keeping the truck upright or from tipping back when not in use. It is made from a long strip of flat stock having a curve bent on the end in order to have it bear tightly against the side of the truck. The pin D serves as a stop when the prop is pulled out. The prop is operated with the foot, being closed in when the truck is in use.

### INK DRYING FAN.

By F. A.

WHEN tracing over a drawing on tracing-paper or cloth, it takes some little time for the ink to dry after each line is drawn, and in order that there may be as little delay as possible in doing the work, it is necessary to have the ink dry quickly. This is usually accomplished by means of a fan made from a piece of card-board or blotter which is waved down near the wet inked line. In the accompanying sketch is shown an idea of an ink-drying fan which dries

INK DRYING FAN.

the ink more rapidly than the method already described. It consists of a strip of card-board which serves for a handle together with several thin strips of paper attached to the end of same as shown. By swinging this down close to the inked-in portion on the tracing, several currents of air are simultaneously forced against the inked line which dries it very quickly.

### A STAND FOR LATHE-DOGS.

By J. Edward.

THE order in which lathe-dogs are usually kept is not always such that they can be conveniently handled. They are generally placed ten or a dozen on a rod that is driven into a post or wall,

as the case may be. When one is wanted, several of these have to be taken off and put back again on the rod in order to secure the right one. In the sketch herewith, is shown a stand for lathe-dogs that can be placed on the floor under one end of a lathe or between two lathes where it will be accessible to workmen. It is made from a board having a number of pegs attached thereto on which the dogs are placed.

STAND FOR LATHE DOGS.

The stand is set at an incline and supported on the back by two braces as shown. Two or three of the smaller sizes of lathe-dogs can be placed on one peg if necessary.

### FINISH-MARKS ON DRAWINGS.

By Alden Street

WHERE two or more lines are close together on a drawing, and one of these contain "finish-marks," it is not always possible to distinguish which of these lines represent the portion to be finished, owing to the fact, that the short oblique bar that intersects the letter "F" and the line on which it is supposed to lie, is not always properly placed. Referring to the sketch shown herewith, this bar on the "finish-mark" A, has this troublesome feature. It often confuses workmen, especially pattern-makers, and much time is consumed

FINISH MARKS ON DRAWINGS.

ed in studying it out or in making inquiries, that might be saved. A little suggestion that overcomes this is shown at the "finish-mark" B, which consists in placing a small round dot on the "Finish-mark" and line. This shows up plainly especially on a blueprint. It also takes up less room than the bar in a short space as at C.

### A CONVENIENT EXPANDING MANDREL

By D. O. B.

WHERE a number of pieces are to be bored and faced on either end, the usual method of procedure is of course to chuck the piece and bore and face the one end, after which it is pressed on the mandrel and the other end faced. Where there are several pieces of this kind to be done, the following method will be found to be a time saver, and it can also be used as a regular manufacturing proposition, as it is cheap to make, and the outlay is small compared with making up a special mandrel for this purpose.

If the work is to be done in the screw machine, an ordinary piece of cold-drawn steel of the required diameter may be held in one of the regular collets. Should the work be done in the engine lathe, the universal chuck may be used, or better yet, a piece slightly larger is chucked up and then turned down to the proper diameter, a shoulder being left so that the piece is slightly shorter than the over-all length to be faced. This piece is then drilled and a pipe tap run in the end, this being as large as possible, in order to give a better hold for the wrench which is used on same. The piece should be drilled back for some distance from the end, and about three saw cuts put in with the hack saw. After the piece is on the mandrel, it is easily expanded by means of the tapered pipe plug.

The writer has used quite a number of these for various purposes, both on screw machines and engine lathes and they have given satisfaction in every case, being cheaply made and yet of sufficient power to hold even under the heaviest cuts. When it is necessary to take but one cut, the carriage may be locked and the piece duplicated in length without any necessity for calipering.

### FACING IN THE DRILL PRESS

By D. S. Mann.

ON one of our machines were a large number of bosses, which were tapped out and faced on the end for lock nuts. The usual method of doing this had been to drill the hole, then spot-face and finally tap, all being done in the radial drill press. To save the time of changing tools a spot-facer was made, which was directly attached to the tap drill. This was placed at the required distance from the end of the drill, and thus automatically acted as a stop for the depth of hole. Of course, the regular feed was thrown out when facing. Only a few seconds were thus required for the facing operation. The facing heads were made of machine steel and slotted for the two high-speed steel blades, these

extending into the grooves in the drill and providing a means of driving same. The heads were split and provided with a clamping screw for regulating the vertical position.

### CARE OF BRUSHES FOR COMMUTATORS AND SLIP RINGS

**S**UPERFICIALLY, the care of brushes is simple enough, says C. H. Smith in the *Electric Journal*, but, in fact, quite the contrary is true. Properly selected and applied brushes may fail on account of neglect, while improperly selected and applied brushes may render acceptable service if given intelligent care. Proper care of the brushes and brush rigging is a fundamental of good commutation, and of prolonged life for both commutator and brushes. Operators of electrical apparatus are directly responsible for the majority of their commutating troubles, although the manufacturer is frequently held to account. There are, on the other hand, a few (a very few) who give such superior attention to their brushes that inherent brush and machine evils are rarely permitted to assert themselves. The following practices will more than justify the effort:—

1—Keep the brushes clean. Both direct and alternating-current brushes get dirty—become coated with carbon and copper dust, which packs between the brush and holder and jams or “freezes” the brush in the holder. This frequently results in broken brushes, a gouged commutator, or both, concluding with a “flat spot,” and necessitating the grinding or turning of the commutator. The commutator is blamed; the brush did the damage; negligence was the cause.

2—Have the spring pressure uniform. Otherwise, the brushes will commutate unequal currents; overload some and underload others; overwork some shunts and underwork others; cause an excessive flow of current between the overloaded brush and holder, and brush and spring; burn the sides and tops of the brushes and destroy the pressure springs. This unbalanced effect of brush work is sometimes known as “selective commutation”—not so descriptive a term perhaps as “unbalanced commutation,” “unequal commutation,” or possibly some other, which might have been selected. However, after the meaning of a term is understood, it matters very little what the spelling is.

3—Fit the brushes to the commutator properly, disregarding looks, and there is nothing “easy” about “grinding in” or “sandpapering” brushes. This apparently simple performance requires patience, care and judgment. Too much haphazard indifference is exercised in the seemingly simple act of making the brush face conform to the commutator

surface. Examine indiscriminately the faces of the brushes on a few machines. The chances are that the brushes on nine out of ten of them will show imperfect brush contact surfaces; two or more contact faces may be clearly discernible on a single brush; one or more corners may be ground away; the heels or toes or both may be “nosed” off; or perhaps, worse still, the faces may show comparatively large areas of inactive surfaces. When “grinding in” brushes keep the sandpaper against the commutator. Do not allow it to “belly,” “bow” or “buckle,” unless convinced that cornerless, heelless, toeless, ball and cylinder faced brushes are the proper things. Knowledge of what is being done, and why, is necessary for most men if their interested efforts are to be expected. The average man if told why will learn how, but only a few learn both why and how for themselves.

#### Grinding-in Brusher

When a new set of brushes is installed it is frequently possible to purchase in the local market sandpaper or garnet paper, or their equivalents (these papers are made in rolls of 25 to 50 yards, or more), in any lengths required to go around a commutator. It should have a lap of several inches, and be so mounted on the commutator as to preclude the lapped end butting against the brushes when the machine is rotated for grinding. With many commutators the friction between the commutator bars and sandpaper (if the paper is taut) will suffice to keep the paper from slipping, especially if when, starting, the paper is given a pull in the direction of rotation by the operator. If the paper persists in slipping, use a little glue to stick the under end of the paper at the lap to the commutator. All traces of the glue must be removed from the bars before putting the machine into service.

A second method is to remove the middle brush on each arm and bind the paper to the commutator by running tape or string entirely around the periphery. If necessary, also bind the paper at the inner and outer ends of the commutator.

After the paper is anchored the commutator may be rotated by hand, or in any convenient way. Great care must be exercised in “grinding in” brushes in this way, as the cutting is very rapid, especially with soft brushes, and much of the life of the brush may be ground away in a very few revolutions. If after the brushes have been surfaced in the above manner, the trailing edge shows a poor seat on account of having had to mount the ridge due to the lap in the paper, a final surfacing should be done with very fine sandpaper by hand. The foregoing method is particularly desirable when a machine has very hard brushes, or a large number of soft brushes. It is a great time-saver after

the knack of applying and anchoring the paper is understood. With slip rings, if carbon or graphite brushes are used, the same general scheme is applicable, but if metal graphite brushes are used, emery cloth, or its equivalent, is preferable.

There are those who advocate and those who practise pulling the grinding paper in the direction of rotation in order to more accurately surface the brush. This seems logical enough on first thought, but inasmuch as the commutator is not in motion when the brushes are surfaced in this manner there is no assurance that the brush will bear the same relation to its holder (and therefore to the commutator) when the commutator is rotating and, consequently, no assurance that the contact will remain fixed. This perhaps explains why brushes frequently show perfect contact when idle, but poor contact when in service. Generally speaking, this method of fitting the brushes, therefore, is not necessarily more dependable than other methods, though in proven instances it is to be commended.

4—It is important that the brush-holders, whether for direct or alternating-current use, be neither too close to nor too far from the commutator or slip rings. A suitable distance is from three-sixteenths to one-quarter of an inch.

5—If the brushes are copper-coated, the coating should not be allowed to come in contact with the commutator or slip rings. This means that as the brushes wear the copper coating should be scraped back and not allowed to extend below the brush-holder box. With proper shunts there should be no need for copper coating from an electrical standpoint, although for mechanical reasons it may be desirable as a protection for soft or structurally weak brushes.

6—If the toe of the brush is very sharp, it is good practice to “nose off” the knife edge. This reduces breakage and militates against gouging into the commutator.

#### Care of Commutators and Slip Rings

The care of commutators and slip rings is so closely related to the care of brushes that a few pertinent requirements may be regarded as applicable.

1—Keep the commutators and rings clean. When in service use a dry canvas or some related cloth having a hard texture. When soft, “nappy” materials are used the “nap” is caught by the slots or rough spots and pulled under the brushes, where it lodges and helps to collect and hold dirt and carbon. When shutting a machine down it is good practice in most cases to clean the commutator with a little gasoline on a hard surfaced material. This not only removes any grease or oil from the commutator, but also frequently improves the brush

condition by removing from their faces the residue of greases or oils collected by them.

2—If the mica is flush, see that it is kept flush. If holes appear in the mica, clean them thoroughly and fill them with a dependable filler. Dental cement is perhaps as desirable for this purpose as anything to be had at the present time. These holes are generally traceable to the too free use of lubricating oils, many of which attack the shellac in the mica and rob the mica of its binder. This trouble in its incipency is of very slow growth, but later increases rapidly, due to the increasing amount of carbon, copper, and other dust which collects in the holes and enlarges the burning area subject to the short-circuits which take place between the bars.

3—If the mica is undercut or recessed, keep the slots clean. For this purpose the use of fibre, bone, horn or hardwood is more desirable than metal, for the reason that metal is likely to cut the mica and deepen the slots. The advantage of deep slots are all disadvantages. Both practically and theoretically, mica need be but a hair's breadth below the surface to accomplish the end desired. The shallower the slot, the better. Depth encourages the collection of carbon, copper, dirt, etc., and is responsible for the bridging of the slots, which necessitates the beveling of the commutator bars.

4—Keep the edges of the commutator bars beveled or chamfered. When slots are deep (as most slots unfortunately and unnecessarily are), the commutator bars pull, or drag over, especially on the lagging edges of the bars. Unless the edges are beveled this pulled-over edge will, in time, close or bridge the slots and cause "flash-overs"; also melted-out connections between the necks of the commutators and windings, and even burned-out armature windings. These things not only may happen, but have happened.

5—Keep the necks of the commutator clean. Dirt between the necks is not only bad for the commutator, but affects adversely the ventilation and, therefore, the temperature of the machine.

6—If the machine "flashes over," shut it down and remove all blisters or burned spots; otherwise the brushes will be unnecessarily worn away, and the commutation will be imperfect.

7—In the matter of slip rings, keep them clean, including studs, spider (or bushing), leads to armature windings, brackets or supports for brushholder yokes, and all insulation between the several parts.

#### NEW TYPE OF CARGO SHIP.

A NEW type of cargo vessel belonging to an Italian shipping firm recently made her maiden voyage to the United

States. The name of the ship is the *Milazzo*, and she is said to be the largest purely cargo-carrying vessel in the world, having a displacement of 20,400 tons when loaded. The cargo hold has a flooring of steel plates which slope away from or toward the sides of the vessel like the letter W. and below this flooring are longitudinal tunnels each of which has a double line of rails. On these rails small trucks travel and are charged with grain or coal through small gate hoppers from the hold. When loaded the trucks are pushed along shafts in which are cable elevators. The latter are attached to the trucks which are raised to the deck where they dump their contents into chutes which discharge from the vessel. The shafts in which the elevators work are divided below the deck into two branches, which command the two tracks in each tunnel. These shafts are surmounted by tubular steel masts which are fitted with guides, and with triggers which automatically upset and discharge the cars as they are elevated to the proper level. The masts are provided with platforms to which the chutes are fixed.

#### SOME LANGUAGE

IN Dallas, Tex., a railroad manager received the following letter: "Gentlemen, —Is it absolutely necessary in the discharge of his duty, day and night, that the engineer of your yard engine should make it ding and dong and fizz and spit and clang and bang and buzz and hiss and bellow and wail and whistle and wheeze and squak and blow and jar and puff and bump and click and clang and clug and moan and moot and toot and crash and grunt and gasp and groan and jerk and rasp and jingle and twang and clack and rumble and jangle and ring and clatter and yelp and croak and howl and bum and boom and clash and jolt and jostle and slam and scrape and throb and crink and jangle and quiver and rumble and roar and smell and shriek like —" —Chicago Tribune.

THE true relationship between the science of the schools and that of the workshop is accurately set forth by Dr. L. H. Baekeland, in an address to the New York section of the Society of Chemical Industry, on the award to him of the Perkin Medal. Laboratory science is, in fact, seldom comprehensive enough to be applicable to practical ends without careful collation and correction. A pioneer cannot, in the nature of things, be expected to make more than a general reconnaissance of the field covered by his investigations. The exact features of the territory he opens must accordingly be established by a much more elaborate survey than he is in a position to make.

#### REBABBITTING BEARINGS.

IN pouring a bearing on a horizontal shaft, says a writer in the *Dodge Idea*, cut out only one of the old bearings at a time, using the old one in order to hold and clamp the mandrel. If it is worn out of true or too thin to hold the mandrel in the right position, put in shims of paper as may be required in order to line it up as wanted, then clamp the mandrel in the position it is desired to assume when finished. This being done, wrap the shaft of the bearing to be poured with oiled paper, and around this wrap a twine string spirally from one end of bearing to the other. This holds the paper snug, and, when the bearing is poured and the string removed, there remains a nice oil channel.

Arrange to pour both the top and bottom of bearing at the same time. This is done by cutting the liners so that they fill out to the shaft nicely, afterwards cutting some notches at intervals for the metal to pass through to fill the bottom. This will leave small strips of metal between the top and bottom, but a thin cold-chisel, driven carefully between the ends of the cap and bottom portions of the bearing, will easily break them apart. Make a funnel of clay or putty around the hole, to hold a surplus of metal, so as to get the benefit of the pressure to insure complete filling of the bearing. The bearing is now ready for the metal.

In heating be sure to not get it too hot. This, in my opinion, is where some of the springing trouble starts. Heat until the metal will just brown a dry pine stick. If both the top and bottom are poured at the same time, there is little, if any, danger of springing the shaft. The metal, of course, falls on the top of shaft, but it immediately starts down the sides, following around the shaft on both sides and passing through the openings in the liners into the bottom. By pouring as fast as it will run, it is only a few seconds until the metal in the bottom has reached the shaft, tending to heat it and offsetting the heat on top. The metal falling down both sides of shaft has tended to spread the heat over a considerable part of its circumference, and the time which has elapsed is so short that there is very little heat absorbed by the shaft, anyway. With the offsetting heat coming from the bottom, it will only be once in many operations, if at all, that trouble will be encountered from this cause. When one bearing has been poured as directed, cut out the next, using the new one by which to clamp and line the shaft, and proceed as above.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## RAIL PUNCHING AND RAIL BREAKING MACHINES.

**T**WO important items of railroad shop equipment are shown in the accompanying photographs, Fig. 1 being a rail punch, and Fig. 2 a rail breaker, both machines being the product of the Covington Machine Co., Covington, Va.

The punching machine is a special adaptation of a vertical type punch and is designed to punch opposite ends of two rails simultaneously which makes it equivalent to punching both ends of one rail in a single operation, the machine being large enough and heavy enough to take care of three punches for each

mounted on the main eccentric shaft outside, engaging with a roller, which roller mechanism is in turn connected with a lever on the outer rock shaft for transmitting motion to the clamp arms through the spring connections shown. The cam is timed so that the clamp affords ample opportunity for sliding the rail into position for punching before it is gripped.

The eccentric shaft bearings as well as the drive shaft bearings are bushed in a form that is easily removed, while the machine may be either belt or motor driven, the former being illustrated with a capacity of lighter weight rails up to and including 40 lbs.

stopped, so that the remainder of the stroke cannot be completed without some breakage. Such a contingency is met by slipping of the belt, and, when motor driven, by the use of a friction clutch.

On the plunger is mounted a steel head, and on the lower portion of the jaw are two renewable bearing parallels mounted in a steel cast block pivoted to the lower face of the machine jaw. These bearing parallels wear out quite rapidly, and where they are mounted directly on the jaw or main casting, they gradually break down the corners and surface to which they are fastened. The steel block is therefore used to save the main frame from gradual deterioration at this point. The main eccentric bearings are bushed with easily renewable bearings, while the drive shaft

FIG. 1—RAIL PUNCHING MACHINE.

end of the rail. Referring to the illustration, the punch is shown set up with four punches, two for each end of the rail. The centre block is a stop and the die blocks are made of proper size and shape to fit in between the rails.

The cross shaft is mounted in bearings and attached to the frame back in the throat, and the balance weight keyed to this same shaft. The two clamping arms are each provided with an extended lug, dropped down between the flange and the bulb of the rail, and the actual clamping is done from a cam

A rail breaker of the open throat type is illustrated in Fig. 2, this design being considered preferable to that with a closed throat. Owing to the heavy shocks experienced in working, special attention has been paid to the size of the main bearings for the eccentric shaft which with the eccentric shaft bearing in the cover has been made exceptionally large.

This machine is preferably belt driven as careless operators frequently allow the plunger head to jamb to such an extent that the machine is instantly

FIG. 2—RAIL BREAKING MACHINE.

bearings are of babbit construction with caps and bolts.

The rail is preferably broken by laying it with the side of the bulb and thin edge of the flange on the parallels, and a steel fuller on the end of a metal handle is interposed by the operator between the rail and the plunger head. One stroke of the plunger is all that is necessary to break the rail.

The machine illustrated is designed to handle rails up to and including 100 lbs. per yard, machines for larger sized rails being also built.

### SPECIAL MULTIPLE DRILLING MACHINE

A SPECIAL multiple drilling machine is illustrated in Figs. 1 and 2, having been recently built by the Langelier Mfg. Co., Providence, R.I., for drilling at one operation twelve  $\frac{1}{8}$  in. holes in the outer sleeve of the Knight type motor built by a prominent American manufacturer. A machine of similar type but for drilling four  $\frac{1}{8}$  in. holes only in the inner sleeve has also been built, the output of each machine being at the rate of  $3\frac{1}{2}$  sleeves per min., or 2,100 per day.

The operating side of the machine is shown in Fig. 1 from which the principal points of the design are apparent. Two columns are arranged on a common base, the column at the left being provided with ways on which slides a tailstock A, which supports the work on an expanding arbor. The sleeve is a thin cast iron tube on one end of which are two lugs to which a connecting rod is attached for reciprocating it. This end is placed on the arbor first and when in contact with stop B, it locates each sleeve accurately in a circular direction. By means of hand wheel C, the sleeve is inserted in the tubular drilling jig mounted in line with the centre of tailstock, the end of the sleeve coming in contact with a positive adjustable stop inside the drill jig.

Four drilling heads, each carrying three spindles are arranged radially as

The spindles are driven by spiral gearing from four shafts which extend to the rear where their belt pulleys are driven by an endless belt which in turn is driven by two large pulleys on its under side, geared to the main drive pulley which is belted to the self-contained countershaft on the end of the bed.

Simultaneous feed to the spindles is obtained through a spur rim gear enclosed in the flanged portion of the drilling column. This gear is concentric with the work and is operated by hand-wheel through a spur train. Four segmental cams are provided on the rim gear, each cam operating one of four feed yokes which are clamped to the sleeves on the outer end of the drill spindles. This clamp connection allows of easily adjusting the spindles individually.

The expanding arbor is opened and closed automatically by compressed air which is controlled by a small piston valve on the back of tailstock, operated by a fixed stop attached to the slide, see Fig. 2. The tailstock is also automatically locked in position for drilling by a small adjustable cam plate on the front side of tailstock, engaging with a locking lever which is released by the pedal in front of the bed. Near this pedal may be observed the belt shifting lever in convenient location.

### CHARGING BELL FOR BLAST FURNACES

AN improvement in charging bells for blast furnaces is covered by a recent patent granted to Julian Kennedy of

CHARGING BELL FOR BLAST FURNACES.

Pittsburgh. It has been designed for guiding or controlling the charge, and maintaining the bell in its proper position, so that each charge will be approximately equally distributed around

FIG. 1. OPERATING SIDE OF MULTIPLE DRILLING MACHINE.

FIG. 2. REAR VIEW OF DRILL SHOWING AIR VALVE ON TAILSTOCK.

shown, being mounted on a circular plate which in turn is attached to a similar flanged portion of the drilling column.

The drill speed is 2,500 revs. per min. Floor space occupied is 4 ft. by 6 ft. Height 5 ft. 9 in. and net weight 3,500 lbs.

the furnace—a feat usually difficult to accomplish.

The illustration shows part of the details, in which (a) designates a blast-

furnace feed hopper, and (b) the discharge bell with a supporting and operating stem, (c). There are radial wings, (d), so arranged as to retain the bell centrally within the hopper and also to provide guides for the charge, so that the material will move in a radial direction and be restrained from moving at a tangent with relation to the center of the hopper. The wings (d) do not extend to the upper face of the bell at their outer edges, permitting the material passing through one section to spread out and meet that passing through adjacent sections. These wings are cast as part of the hub (e), mounted on the boss (f),

### 1000-TON HYDRAULIC BRIQUETTING PRESS.

THE accompanying photograph illustrates a new design of hydraulic press recently brought out by The Hydraulic Press Mfg. Co., Mount Gilead, Ohio. The press is used for briquetting metal borings, turnings, etc., so that they may be remelted without the loss of valuable ingredients, at the same time preventing oxidation, and putting the material in a convenient form for handling. This design of press is of the four rod inverted cylinder type and is built in three different sizes and pressure capacities, 1000 tons, 750 tons and 300 tons. The illustration shown is a reproduction of the 1000 ton press.

The briquet forming mechanism of these presses is unique in design and operation, being capable of forming a briquet quickly and of uniform density. This is accomplished by placing the material in a floating mould which is supported by four springs. When the pressure is applied upon the material from above the friction of the material on the sides of the mould causes it to move down over a stationary plunger which projects into the mould from below. Pressure is thus applied on the bottom as well as on the top of the material. A briquet of uniform density is obtained in this manner.

After being formed the briquet is ejected from the mold by the pressure of the main ram being applied upon the briquet with the lower plunger removed, the latter being done by a simple movement of a controlling lever. The briquet then falls through to the base of the press from whence it is removed by a conveyer installed by the customer. On the 1000 ton and 750 ton presses, hydraulic push cylinders lift the floating mould while the lower die is withdrawn or returned to place. A collar surrounding the lower die is held against the mould by a spring to close up all

clearance between the mould and the lower die in the 300-ton press.

The press illustrated is provided with a surge tank, the base of which is located higher than the main cylinder. By a simple movement of the valve lever the plunger drops to the material in the mould and the main cylinder is filled with fluid by suction caused by the lowering of the ram as well as by gravity of the fluid. Thus the first stroke of the pump initiates the pressure upon the material. After the pressing operation the main ram is returned by means of the auxiliary ram located at the extreme top of the press. This action returns the fluid to the surge tank.

Every operation of these presses is controlled by levers which are con-

HYDRAULIC PRESS FOR BRIQUETTING METAL BORINGS AND TURNINGS.

veniently located for the operator. The stationary plunger projecting into the mould from below is displaced and replaced by means of a lever located near the operating valve.

The presses are solidly built, steel being used throughout. The strain rods are made of heat treated forged steel. They have solid heads and collars. The main ram is guided in its travel by babbitted bearings working upon the strain rods and by a long bearing in the throat of the cylinder. The floating mould is guided by babbitted bearings. The collars located on the centre of the strain rods prevent the floating mould ascending too high.

### FAILURES OF CRANKSHAFTS IN DIESEL ENGINES.

THAT the engineer in charge is primarily responsible for the lift of the crankshafts of Diesel engines is the opinion expressed in a paper read before the Diesel Engine Users' Association recently.

The paper states that certain reasonable and simple precautions will prolong the period of usefulness indefinitely. A number of failures cited in the paper were attributed to lack of alignment of the main bearings, which generally resulted from unequal wear of the several shaft bearings, although this same result was brought about in some cases by negligence in the erection of the engine, or to defective foundations in some of the older ones.

A four-cylinder engine is most likely to suffer shaft breaks, with the two-cylinder types having heavy fly-wheels, a close second. The shafts almost always fail through the throw arms, the crack starting at the center and working outwards. With the four-cylinder engine, the throw arm nearest the fly-wheel fails in most cases and this is also true of the two-cylinder units. Either throw of the single-cylinder type may fail and with a three-cylinder engine, which is the least likely to be affected, the failures are equally divided between the two end throws.

### HIGH LIFT SAFETY VALVES.

AN opinion prevails that high-lift safety valves produce injurious shocks both to the boiler and valve and the Boiler Code Committee of the American Society of Mechanical Engineers propose to limit the permissible lift. In a paper on the subject submitted to the above society, G. H. Clark alludes to the inadequacy of present day valves to pass off the maximum quantity of steam generated. The discharge capacity of the ordinary valve is limited by both the apparent impossibility of regulation and the shock produced at closing. The pressure below the disc before and during the blowing period is investigated. The action of a valve depends, not on the magnitude of a lifting force, but on variation of lifting force with discharge capacity and pressure. The design of a valve adjustable for variable lifting force is described. Six charts show the characteristic actions of different valves. Discharge capacity of valves with diaphragms from 1 in. to 4 in. are tabulated. A valve with the discharge turned downwards, having an upward "jet" action on the disc, is shown and discussed. In determining the rules, valves must be considered on the basis of discharge capacity and action, rather than on the lift.

### THE COMING OF THE TECHNOLOGIST

THE term "key" industries has arisen through the prominence which the war has given to many manufacturing lines with the importance of which the general public has hitherto been rather unacquainted, but which, by virtue of their relation to other industries, have exercised a controlling influence over wide fields of semi-finished and finished manufactures. Through the manner in which they developed such lines as optical and chemical glass, photographic and other chemicals, semi-rare metals, dyes and fertilizers, our enemy has been able to seriously handicap our efforts in self-defence, and delay for a regrettable length of time the assumption of that offensive action now developing on the part of the Allies.

While such a course of events was unfortunate at the time, its ultimate effect in awakening the British Empire as a whole to a due recognition of the role played by the chemical engineer, will ultimately prove to have been a blessing in disguise.

Optical glass is a vital part of the observation equipment of military and naval forces, laboratory equipment is useless without many items composed of special glass. The large proportion of fine chemicals and dyes made in Germany were produced in plants which had been laid down with the specific intention of being rapidly converted to explosives manufacture, while the control of the potash trade enabled the productivity of other nations to be seriously interfered with.

Through all of these sinister evidences of premeditated action is seen the hand of the chemical engineer, not that anomalous person who, as a contemporary expresses it, is "half chemist, half engineer, and wholly out for his own immediate profit, and who will sell you his wares whether they are suitable for the purpose or not." No! The many advantages enjoyed by our enemy were obtained through the appreciation and application of scientific knowledge, not necessarily abstruse, but requiring a degree of skilled knowledge and supervision which are far in advance of rule of thumb methods still existing in many plants; yet the policy of many firms has been to depreciate the value of such work and question the ability of a highly trained technical man to direct practical work.

The wrongs under which technologists have labored in the past must be removed and the rights of men trained in the mysteries of nature to direct operations of a practical kind be recognized. That such acknowledgment is

now on its way is evident in many directions, but its development must not be unnecessarily delayed, let alone its scope narrowed, if our hopes for future achievement are to materialize.

### FOUNDRYMEN'S CONVENTION AND EXHIBITION

THE week of September 11 witnessed the holding in Cleveland, Ohio, of not only the Annual Conventions of the American Foundrymen's Association, and American Institute of Metals, but of an Exhibition of foundry equipment and supplies under their joint auspices and direction for the first time. It had been anticipated that in many respects, if not altogether, established records covering convention work, attendance, exhibits, exhibitors, instructional and entertainment features were likely to "go by the board," and that realization in the various directions indicated has been achieved is now beyond question. A fair representation of Canadian foundrymen took advantage of the opportunity to get into closer touch with developments in progress and pending, relative to the more accurate determination of foundry product constituents, and to familiarize themselves with equipment progress towards greater individual plant efficiency.

It occurs to us, however, that Canadian representation at this "Mecca" of foundrymen is each year far below what it should be, in view of the fact that our sphere of foundry enterprise is all the time enlarging in importance and variety of product. The past two years has witnessed quite an abnormal development along lines akin to and dependent in large part upon the foundry industry—grey iron, steel and non-ferrous. We have not, however, become conscious that in the latter directions, equally abnormal achievement may be realized. Our representation at these annual conventions and exhibitions can be comfortably doubled or even trebled in immediately succeeding years, and not only so, but Canada's representative membership in either the American Foundrymen's Association or the American Institute of Metals can easily be proportionately increased.

In the annual report submitted by the secretary of the American Foundrymen's Association, it is somewhat significant that the membership of that body is practically stationary, the figures for July 31, 1915, and July 31, 1916, being 973 and 974 respectively. Mention was made of the fact that in Canada and the United States there are some 5,000 foundries turning out grey and malleable iron, and steel castings, yet only some 20 per cent. of the industry on that basis is represented by membership in the American Foundrymen's Association. As expressed by the secretary, the meagre percentage above stated is a sad commentary on the interest displayed by foundrymen in the attainment of progress by organized effort. Just what percentage the membership of Canadian foundrymen bears to its total foundry plants, large and small, we do not at the moment have figures available, yet we are well within the mark in saying that something less than 10 per cent. may be assumed. The membership fee is more or less nominal compared with that required by Technical Societies and Associations generally, and in the matter of value received—material and educational, the American Foundrymen's Association, through its convention, exhibition and other activities, occupies perhaps premier place.

We hope in succeeding issues to feature the recent convention and exhibition proceedings as befits their importance, and so familiarize our readers with the work being accomplished that those of them more directly concerned with foundry enterprises may be disposed to take a larger interest in this co-operative effort for the advancement of the foundry craft and calling.

## INDUSTRIAL NOTABILITIES

**F**RANCIS HENRY WHITTON, general manager, The Steel Company of Canada, Limited, Hamilton, Ont., was born in Northamptonshire, England, October 2, 1859, the son of Corbett and Elizabeth Mary Whitton. He was educated at Abington House School, and passed the preliminary examinations at Cambridge University. He came to Canada in March, 1877. The various steps of his business career have been as follows:—Stenographer in office of G.T.R., Montreal, 1877-1879; with Louisville and Nashville Railroad, Louisville, Kentucky, 1879-1880; president's secretary, the Chicago Malleable Iron Co., Chicago, 1880-1887; returned to Canada and organized the Ontario

FRANCIS HENRY WHITTON

Tack Co., Hamilton, Ont., of which he was manager, 1887-1907; when that concern amalgamated with the Canada Screw Co., he was made general manager. On the formation of The Steel Company of Canada, Ltd., in 1910, he became assistant general manager, which office he occupied until April 25, 1916, when he was appointed general manager.

Mr. Whitton is a member of the Canadian Manufacturers' Association, the American Iron and Steel Institute, and the Hamilton Board of Trade. He married Eva LeDuc, daughter of Louis Xavier LeDuc, Montreal, March 16, 1885; has one son, Corbett F. Whitton, Assistant Secretary of The Steel Company of Canada, Ltd. His clubs are the Hamilton; Tamahaac; Caledon Mountain Trout; Canadian; Hamilton Rowing; and National (Toronto). His recreations are shooting, fishing, farming, and formerly cricket; played against the Australians in Canada in 1878. In politics he is Conservative, in religion a Roman Catholic. His residence is 353 Bay Street, Hamilton, Ont.

Prices Per Lb. Unless Otherwise Stated.

present time is apparently as great as ever. The demand for billets and sheet bars continues heavy, with quotations at \$45 Pittsburg. Plates are still very active, with ship plates in heavy demand. The sheet situation is unchanged; the prospect of higher prices on sheet bars is however developing a stronger tendency in prices of the ultimate product. Increased activity is being shown in wire and wire products, and the mills are beginning to experience the additional pressure. Inquiries for wrought iron pipe and boiler tubes indicate a rising demand, the recent advance having apparently stimulated consumers to cover their early requirements. While no changes are noted in local quotations, dealers here intimate that an advance may be expected.

## Metals.

The general situation in the metal market shows little change. Copper is at present firm, with indications of early strength, on heavy pending business for export trade. Tin is quiet with an undertone of early activity. Increased interest in spelter is developing a stronger market. Lead is active and advancing in price. Antimony is very quiet and ensteady. Aluminum is very firm, showing a slight increase.

**Copper.**—With the exception of the large producers, the general market is quiet. The consumption of copper at present is exceedingly heavy and will continue to tax the capacity of the existing refineries until further additional facilities are provided. What activity there is, appears to be confined largely to the leading interests, and it is very difficult to state the exact market conditions. While much of the current business is for export purposes, the greater proportion is being used for domestic requirements, the demands of the brass mills being exceptionally heavy. There are indications that considerable export business is pending, for next year delivery; but no definite information is at present available. It is believed that quiet buying is quite general. The London market has developed a stronger tone on increasing demand; advances of £6 on spot and £5 on futures, being equal to 1¼ cents New York. Current London prices are £116 and £112 respectively. New York has become stronger, and an advance of ½ cent is general; prime lake being quoted at 28¼ cents, electrolytic 28½ cents, and castings 26½ cents per pound. All quotations are however, nominal. The local situation is unchanged with prices firm at 31 cents for lake and electrolytic, and 30 cents for casting.

**Tin.**—The fact that considerable quantities of Banca tin are continually being received is having the effect of

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

**Montreal, Que., Sept. 18, 1916.**—Industrial and commercial activity at the present time continue to reflect the unceasing prosperity of all branches of trade. The new War Loan promises to equal if not surpass all previous efforts in that direction and subscriptions are pouring in, demonstrating the great interest being taken, both by firms and individuals. General trade conditions have still an improving tendency, although the scarcity of labor continues to be keenly felt. The cooler weather is contributing to better production in those industries which were materially affected by the extreme heat of the summer months.

**Pig Iron.**

Owing to the increased activity now

being shown in the pig iron situation the market is developing a strong tendency, and some quotations have been advanced from 25 to 50 cents a ton. The demand for basic and foundry iron is assuming large proportions, and further advances are not unlikely.

**Steel**

The return to better operating conditions is giving some relief to the recent congestion in the steel mills. The requirements of steel users at the present time are so heavy that even the greatly increased facilities of production, during the past year, have not been sufficient to cope with the abnormal situation, and the tension at the

weakening the market. The demand is however of sufficient volume to offset any sharp decline in prices, and it is anticipated that consumers will soon be in the market to cover their future requirements. This outlook is having the effect of maintaining a very firm situation abroad, quotations on the London market having shown a slight advance. The New York situation is however indicating slight weakness and quotations have declined to 38½ cents or ¼ cent lower than last week. Local dealers report a quiet week with prices firm at 44 cents per pound.

**Spelter.**—Owing to the recent activity shown by dealers and exporters, the market in spelter has developed a firmer tendency, which has somewhat relieved the anxiety lately apparent in regard to this metal. The falling off in the home consumption has been replaced by a very encouraging export demand, and the upward trend has become more general. The leading producers are apparently well supplied with future possibilities, and the situation seems brighter than for some time past. Increased interest in this metal is being shown on the London market and prices are now £54 for spot, and £47 for futures, being an advance of £4 and £3 respectively, which is equivalent to about one cent per pound, New York. The effect of the general conditions is also reflected in a ⅝ cent advance on the New York market, which is now quoting 6⅝ cents per pound nominal. Dealers here report a fairly active market, with prices steady at 13 cents, but with a strong undertone.

**Lead.**—Increased activity in this metal has developed a strong market, and both the home and export demand is very good. Following an advance of ¼ cent, the New York market is quoting the Trust price at 6¾ cents with the Independents 1-10 cent higher. Dealers here report a steady market on good demand with prices strong at 8¾ cents per pound.

**Antimony.**—Owing to the poor demand, the market is easy with a tendency to become weaker. Chinese and Japanese metal is quoted at 11¼ to 11¾ cents per pound, being a decline of ¼ to ½ cent per pound. Local dealers are quoting 16 cents on a quiet market.

**Aluminum** — This metal is reported stronger on the New York market, slight advances being quoted. Local conditions are firm and unchanged at 68 cents per pound.

#### Machine Tools and Supplies

The volume of business that has been an outstanding feature of the machine tool industry for the past two years, is gradually resuming pre-war conditions;

the bulk of present activity being due to the intermittent demand for shell machinery, although the requirements for domestic purposes have added more or less to the general activity. Inquiries for heavy shell machinery are still coming in, and delivery on these tools can be had in reasonable time. Second-hand equipments show heavy offerings owing to the placing on the market of tools formerly used for the manufacture of the lighted shells, and also because of various tools being disposed of to make room for heavier equipment. A feature of the machine tool development has been the large number of devices and attachments placed in service during the past year or two for the purpose of facilitating the production of munitions on new and existing machinery. While the greater number of these are specially designed for shell-making operations, many of them will find a permanent place in the manufacture of domestic utilities. A

#### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

heavy and unceasing demand continues for all classes of machine tool accessories and shop supplies.

#### Scrap.

While no special developments are noted in the scrap situation, there are some indications that the supply of heavier steel scrap is not as plentiful as it was some time ago, owing to the constant consumption of the crop ends and the reduction in some cases of the percentage discard in the production of ingots. The stronger tone of pig iron is also having its effect upon the situation, and the tendency is for an advance in heavy melting steel scrap. The present price of Pittsburgh scrap is 16½ cents, this being an advance of ½ cent during the week. The local quotation has risen ¼ cent, being now 9¼ cents per pound. All steel and iron scrap is very strong with a rising tendency. The situation in scrap metals continues steady with slight declines noted in composition turnings, also brass and zinc scrap. Scrap aluminum is a little stronger, as is old stereotype. With the exception of scrap at 7½ cents, a

decline of ¼ cent, the prices on local scrap metals are firm and unchanged.

**Toronto, Ont., Sept. 19.**—The industrial situation continues satisfactory. The volume of trade is on the increase, and, despite the poor crops, the outlook is favorable. In normal times a poor harvest has usually adversely affected trade, but under prevailing conditions the effect is not so serious, as the greater part of the business being done by manufacturers is on account of war orders and not to meet domestic requirements.

#### Steel

The steel market shows increasing strength, and the mills have sufficient business to keep them busy for twelve months. In consequence of this great activity, it is becoming more difficult to get deliveries than ever, and prices have a marked upward tendency. The scarcity of steel will likely become serious, particularly as regards its effect on output of munitions, in spite of the large increase in mill capacity. Hopes of lower prices on steel during this year have been abandoned, as there is every indication of advances in steel products generally. As mentioned last week, wrought iron pipe has advanced, the new prices being published in this issue. Higher prices on boiler tubes are looked for before this month is out, while plates may also take another advance in the near future, the situation in the United States being such that higher prices are inevitable. Prices of steel and iron bars are very firm and in fair demand.

The market for sheets is very firm and the demand continues heavy. Light gauge sheets are showing considerable strength, and the market for these grades is stronger. The demand for black sheets is such that the mills are operating at capacity, and deliveries are very backward. Sheet bars continue very firm, and may advance, in which case higher prices on sheets are looked for. Prices of galvanized sheets are holding steady, and although spelter is weaker, the probable further increase in light sheets may result in an advance in galvanized material within the next two or three months.

The situation in the steel market in the United States is unchanged: the export demand continues very heavy, and prices are expected to advance still further. Plates are particularly strong and scarce, the demand being exceptionally heavy. Although the producing capacity of the mills has been greatly increased, it is not sufficient to take care of the demand, with the result that deliveries are getting more backward and unfilled tonnage heavier. There have been no price changes of importance made during the week. Steel bars are quoted at 2.60c; plates, 4c; and shapes, 2.60c Pittsburgh.

#### Pig Iron

There is no change in the situation in

the pig iron market: consumption is very heavy and prices very firm.

#### Machine Tools

The shortage of shell forgings has become an important factor in the machine tool market. The capacity of the machine shops is greater than that of forging plants, with the result that the output of the former is being curtailed. In consequence of this, the demand for machine tools is not as heavy as it might otherwise be, as orders for shells are sufficiently plentiful to keep machine shops operating at capacity. The market is steady, with the demand almost entirely for heavy duty equipment for producing large calibre shells. Deliveries are fair on large lathes, but very slow on standard tools. A considerable amount of second-hand equipment has recently come on the market in the United States, but very little is coming into Canada.

#### Supplies

The situation continues much the same as during the past few weeks; business is very good, but some lines of machine shop supplies are getting scarce. Dealers report a difficulty in keeping their stocks up owing to the delay in getting goods from the manufacturers. Chucks, drills,

taps, dies, and cutters are particularly hard to get owing to conditions in the steel market. Prices generally on steel and brass goods are very firm, and in some instances will most probably advance. Linseed oil has declined, being now quoted at 83c for raw and 86c for boiled oil. Turpentine has advanced 2c, and is now quoted at 71c per gallon.

#### Metals

The feature of the metal markets is the strong position of copper, due to heavy buying and sold up condition of producers. The Allies continue to buy heavily, and it is understood that orders for a million pounds of copper have recently been placed in the States by Canadian interests. Prices on all metals have been maintained during the week, but no changes of importance have to be noted. Business locally continues good.

**Copper.**—With producers sold up for the remainder of the year and the demand for copper as insistent as ever, the market is consequently very strong and prices firm. The copper market advanced in London during the week, but is unchanged in New York in the meantime, although higher prices are likely. Local

quotations are very firm at 30c per pound.

**Tin.**—The market is quiet, with a firm undertone, but business is dull. The London market advanced recently, but this has not as yet affected local quotations, which are now 44c per pound.

**Spelter.**—The demand for spelter is more active, and the market is stronger. It is reported that a Canadian inquiry for 500,000 pounds has been closed in the United States. Local quotations are unchanged at 14c per pound.

**Lead.**—The market is firmer owing to increase in demand; quotations, however, are unchanged, but firm. Canadian buyers have taken over 1,500 tons from United States producers during the week, while other and similar transactions have been recently closed. Local price, 8 $\frac{3}{4}$ c per pound.

**Antimony.**—The market is quiet, with little business offering. It is reported that some producers are holding out for higher prices. Quotations unchanged at 18c per pound.

**Aluminum.**—There has been a steady demand for aluminum during this week, and supplies are smaller. Quotations are firm, but unchanged at 68c per pound.

## CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

# INDUSTRIAL <sup>A</sup><sub>N</sub><sup>D</sup> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**Toronto.**—The John Inglis Co. are building a new forge shop to cost about \$6,000.

**Dundas, Ont.**—The John Bertram Sons & Co., are making an extension to their plant.

**Montreal, Que.**—Lymburner, Ltd., will build a reinforced concrete addition to their plant at a cost of \$12,000.

**Englehart, Ont.**—The Dome Consolidated Mining Co., will make considerable extensions to their mill.

**St. Thomas, Ont.**—The American Brake Shoe Co. will instal equipment so as to operate all its machinery by electric motors.

**Toronto.**—Puddy Bros. have received a permit to add to their boiler room at 60 Paton road, at a cost of \$1,000.

**Renfrew, Ont.**—Owing to the possibility of a shortage of water for power purposes, a steam reserve plant may be installed here.

**Weston, Ont.**—The Deakin Construction Co., are the contractors for the new plant which the Russell Motor Car Co., are building here.

**London, Ont.**—Plans are being prepared for the erection of a galvanizing plant for the McClary Mfg. Co. Approximate cost \$30,000.

**Vancouver, B.C.**—It is reported that the Shell Oil Co., propose to establish a large oil refinery in this district. A site has been acquired on Lulu Island. W. M. Smith of London, England, is president of the company.

**Port Colborne, Ont.**—Contracts have been let to the Foundation Co., of New York and Montreal, for the International Nickel Co. plant to be located here on the east side of the lake front. The complete plans call for an expenditure of about \$3,000,000 but the initial expenditure will be considerably less than that amount.

**Collingwood, Ont.**—The oil tank steamer Iocolite left here on Saturday afternoon on her maiden trip to Sarnia. A successful trial trip was made around the bay on Friday. This is the second boat of this kind that has been built by the Collingwood Shipbuilding Co. for

the Imperial Oil Co., this year. A third one is expected to be launched shortly.

## Electrical

**Kingston, Ont.**—The Hydro-Electric Commission will extend its power lines in Eastern Ontario as far as Napanee

**Mount Dennis, Ont.**—The ratepayers will hold a meeting shortly to consider the question of installing the hydro-electric system.

**Hamilton, Ont.**—The Townships of Barton, Saltfleet, East and West Flamboro propose submitting hydro-electric by-laws to the ratepayers in January.

**Toronto.**—The Ontario and Toronto Hydro-electric Commissions have laid before the York Township Council an agreement for the supply of electric power in the township.

**Sarnia.**—The high tension line of the hydro-electric system is completed to within one mile of the city limits. In the course of a few days the line will be here. Power will not be turned on, however, until the transformers are installed in the power house.

## Municipal

**Edmonton, Alta.**—The city propose spending \$75,000 for street railway extensions. A by-law will be voted on.

**Lindsay, Ont.**—The Town Council contemplate extensions to the water distributing system to cost about \$8,000.

**Ottawa.**—The City Council have awarded the contract for supply of cast iron pipe to the National Iron Works, Ltd., Toronto

**Montreal.**—The City Council have awarded a contract for the supply of cast iron pipe to the Canada Iron Foundries, Ltd., Montreal.

**Lyall, Man.**—Tenders will shortly be called for the construction of an electric lighting system and transmission line. Engineer, George Guy, Winnipeg.

**Chatham, Ont.**—An effort is being made by the city to sell the gas producer plant which is not required now that hydro-electric power has been installed.

**Merritton, Ont.**—The general contract for the construction of a screen plant for the Riordon Pulp & Paper Co., has been awarded to the J. V. Gray Construction Co., Toronto.

**Toronto, Ont.**—The York Township Council propose making considerable extensions to the waterworks system. Cast iron pipe, valves and hydrants will be required. Frank Barber, Toronto is the engineer.

**Kitchener, Ont.**—Plans of a waterworks system to be constructed for the City Council have been approved by the Provincial Board of Health. Approximate cost, \$100,000. Engineer Herbert Johnston.

## Tenders

**Toronto.**—Tenders will be received until October 2, addressed to the Chairman of the Toronto Harbor Commissioners, and marked "Tenders for Cherry Street Bascule Bridge." All information may be obtained by applying to E. L. Cousins, chief engineer and manager.

**Toronto.**—Tenders will be received by the Chairman, Board of Control, City Hall, Toronto, up to October 3, 1916, for the manufacture, supply and erection of one twelve-inch venturi meter and register, indicator recorder at the Main Sewage Disposal Works, Toronto. Specifications may be seen and forms of tender obtained at the Works Department, Room 6, City Hall.

**Ottawa.**—Tenders will be received until September 29, for the construction of an extension to the west breakwater at Port Stanley, Elgin County, Ont. Plans and forms contract can be seen, and specification and forms of tender obtained at the Department of Public Works, Ottawa, at the offices of the District Engineers at Windsor, Ont., and Equity Building, Toronto, also on application to the Postmaster at Port Stanley, Ont.

**Toronto.**—Tenders for stores, office and garage buildings at Murray and Caer-Howell streets, addressed to the Chairman of the Toronto Electric Commissioners, will be received until, October 2, 1916. Plans and specifications will

be open for examination and explanation at the office of the architects, 908 Royal Bank Building, Toronto, and a further set of plans and specifications may be inspected, but not obtained, at the office of the Purchasing Agent of the Hydro-Electric System, Hermant Building, Toronto.

**Ottawa.**—Tenders will be received up to October 2 for the undermentioned metal supplies for delivery to H.M.C. Dockyards at Halifax, N.S., and Esquimalt, B.C., Items 1, steel angles, bars, sheets and plates; 2, iron bars, fire bar; 3, brass bars and sheets; 4, copper sheets and bars; 5, solder tin and alloys; 6, tubes brass and copper. Forms of tender and full information may be obtained by application to the Department at Ottawa, or to the Naval Store Officers, at H.M.C. Dockyard Halifax, N.S., and Esquimalt B.C. In making application for forms, the particular item or items for which forms are required should be clearly stated.

**Dartmouth, N.S.**—Tenders addressed to J. W. Pugsley, secretary Department of Railways and Canals, Ottawa, Ont., will be received until Wednesday, September 27, 1916, for an enclosed water tank, capacity 40,000 imperial gallons, at each of the following points on the Dartmouth Branch Line: East Lawrencetown; Meagher's Grant, Upper Musquodoboit. Plans and specifications may be seen at the office of the chief engineer of the Department of Railways and Canals, Ottawa, at the office of the chief engineer, Canadian Government Railway, Moncton, N. B., and at the office of the engineer in charge, Dartmouth, N.S.

## General Industrial

**Galt, Ont.**—The Galt Paper Box Co. proposes to enlarge its plant here.

**Hamilton.**—The Chipman & Hollo Knitting Co., are building a factory here.

**Toronto.**—The Sheet Metal Products Co., are building an addition to their factory.

**Belleville, Ont.**—Work has started on the new factory which the Maple Leaf Tire Co., are building here at a cost of \$100,000 including equipment.

**Sarnia.**—Fire broke out on Thursday morning in the plant of the Ontario Canning Co., here, destroying the factory and entailing a loss estimated at approximately \$100,000.

**Acton, Ont.**—The Reliance Shoe Co., Toronto, propose to build a factory here, estimated to cost \$10,000. A by-law will be submitted to the ratepayers to authorize the granting of a loan and free site.

**St. Thomas, Ont.**—Fire on Saturday completely destroyed the plant of the St. Thomas Dehydration Co., as well as that of the Canadian Wood Products Co. The loss to the Dehydration Co. will be heavy, \$30,000 being a conservative estimate. The Wood Products Co.'s loss is placed at \$6,000, with insurance of \$2,500.

## Trade Gossip

The Rockwood Sprinkler Co., of Montreal will install a sprinkler system in the new machine shop which is being

erected by the Canadian Ingersoll Rand Co., Sherbrooke, Que.

**Ottawa, Ont.**—The International Land & Lumber Co. will erect a 100-ton pulp mill, on the Ashuapmauch River, in the Lake St. John district. Among those interested in the company are J. L. Bate, R. N. Bate and Thomas Asquith, all of Ottawa.

The Transmission Ball Bearing Co., Buffalo, N.Y., have been compelled to extend their plant and have acquired a site of seven acres on which new works will be erected immediately. This concern is a branch of the Chapman Double Ball Bearing Co., Toronto.

The Special Trade Commission of the Dominion of Canada have returned and will submit their report to Sir George Foster next week. The report will summarize the information secured by the commissioners and will indicate to Canadian manufacturers the articles for which there is a demand abroad. It will not contain all the data secured by the commissioners. The commissioners, however, will be prepared to answer questions put to them by manufacturers of the country.

## Personal

Philip E. Edelman of St. Paul, Winnipeg, has been engaged by the Dominion Government to prepare plans for wireless installations in the Federal Parks in Canada.

James W. Woods, Chairman of the Dominion Special Trade Commission has returned to Toronto after an extended tour in Europe.

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

**BRAZIL**  
Bahia, British Consul.  
Rio de Janeiro, British Consul General.

**CHILE**  
Valparaiso, British Consul General.

**COLOMBIA**  
Bogota, British Consul General.

**ECUADOR**  
Quito, British Consul General.

**EGYPT**  
Alexandria, British Consul General.

**FRANCE**  
Havre, British Consul General.  
Marseilles, British Consul General.

**INDIA**  
Calcutta, Director General of Commercial Intelligence.

**ITALY**  
Genoa, British Consul General.  
Milan, British Consul.

**MEXICO**  
Mexico, British Consul General.

**NETHERLANDS**  
Amsterdam, British Consul.

**PANAMA**  
Colon, British Consul.  
Panama, British Vice-Consul.

**PERU**  
Lima, British Vice-Consul.

**PORTUGAL**  
Lisbon, British Consul.

**RUSSIA**  
Moscow, British Consul General.  
Petrograd, British Consul.  
Vladivostok, British Consul.  
Odessa, British Consul General.

**SPAIN**  
Barcelona, British Consul General.  
Madrid, British Consul.

**SWEDEN**  
Stockholm, British Consul.

**SWITZERLAND**  
Geneva, British Consul.

**URUGUAY**  
Monte Video, British Vice-Consul.

**VENEZUELA**  
Caracas, British Vice-Consul.

# What Could You Do?

Rough Bore,  
Straight Diameter

Rough Bore,  
Inside Radius

If you had one-half the cost of your boring operations? You could then make that improvement you were contemplating. Or on the other hand you could double your output, do a higher grade of work and not increase your cost. Increased efficiency generally means increased cost but in this case you can secure that better efficiency at half the cost. Our Service department is at your disposal in this matter. Investigate.

The Boring Heads illustrated here effect that saving for you. They are the finished product of years of experience in boring head manufacture. They are constructed of high speed steel and are equipped with a micrometer adjustment which adds greatly to the life of the cutters. They can be expanded to compensate for wear of cutters.

The illustrations here are for 8" and 9.2" shells. But from 26 different styles and 16 different sizes we can equip you with this money-saving device regardless of the style of lathe or boring machine or the difficulty of operation. An inquiry will bring you specifications, prices, delivery, etc.

Finish Bore,  
Straight Diameter

Finish Bore,

## The A. R.

Machinery Co., Limited

## Williams

64-66 Front St. W. Toronto

## Soon Pays For Itself

**That is one of its credentials**

A Geometric Threading Machine is the economical way of producing small threaded parts. It is complete with countershaft, change speed gear, adjustable stop for gauging length of thread; and takes floor space 2 ft. x 3 ft. only.

Insures accuracy and greatest production of duplicated threaded parts. Not the usual bolt threading machine. No rough threads with the Geometric.

Send for our Threading Machine Booklet and let it tell you the value of the machine.

### The Geometric Tool Company, New Haven, Conn., U.S.A.

Canadian Agents:- Williams & Wilson, Ltd., Montreal;  
The A. R. Williams Machinery Company Limited,  
Toronto, Winnipeg, St. John, N.B.

*If any advertisement interests you, tear it out now and place with letters to be answered.*

**John East**, manager of the John East Iron Works of Saskatoon, Sask., has just returned from a five-weeks trip to Eastern Canada and the States where he has been purchasing new machinery for his plant.

**J. N. McQuaig** of the sales staff of the A. C. Leslie Co., Montreal has resigned his position to enlist in the 245th Battalion, C.E.F. He has been appointed Quarter-Master Sergeant. **J. Grimbale** for some time assistant to Mr. McQuaig will assume his position during his absence.

**F. B. Leonard**, of the Canadian Pacific Ocean Services, has resigned his position to enter the service of his country, and will leave for England to take up military duties about the middle of the month. Mr. Leonard has been in the service of the Canadian Pacific Ocean Services since September, 1912.

**Sir Harry Drayton**, Chairman of the Dominion Railway Commission, and **Alfred H. Smith**, President of the New York Central Lines, members of the Canadian Railway Commission of Inquiry, have left yesterday for Winnipeg, where they will hold their initial session for the purpose of ascertaining information relative to the railway situation in the Dominion.

## Contracts Awarded

**Chatham, Ont.**—The W. G. Seagrave Co., of Walkerville, Ont., have been awarded a contract for a motor truck for the fire department to cost \$7,900.

**Arnprior, Ont.**—The general contract for the erection of a grist mill and elevator for David Craig has been awarded to Thomas Moran & Son. Estimated cost, \$18,000.

**Assiniboia, Sask.**—The following contracts have been awarded for the new power house. For one 150 h.p. internal combustion engine, to the Canadian Boving Co.; generator exciter switchboard and other apparatus, divided between the Canadian Westinghouse Co., and the Canadian General Electric Co.; pumps, motors, piping and air compressor to the James Balantyne Co., Winnipeg; wire and line material, Northern Electric Co.; approximately 17,500 feet of 4, 6, and 8-in. pipe and specials, and twenty hydrants, twenty-nine gate valves and boxes, C. E. Choun, Winnipeg; erection of power station, supply and installation of heating plant, and construction of reinforced concrete reservoir, J. A. Browley Co. The en-

gineers are Murphy & Underwood of Saskatoon, Sask.

## Railways—Bridges

**St. Catherines.**—It is reported here that the Hydro-Electric Commission may purchase the Niagara, St. Catherines & Toronto Railway from the Mackenzie & Mann interests.

## Marine

**Cobourg, Ont.**—Mr. Brummel of East Trenton, it is stated, has just completed a new type of boat for carrying freight. The boat from outside appearances looks like a huge scow. It is to be run by two twenty-four horsepower gasoline engine, operating two propellers, and has a capacity of 600 barrels of apples. It was built for navigation on the Trent Valley Canal.

**Ottawa.**—Construction of a new lighthouse on Burnt Island, in the Thousand Islands, St. Lawrence River, is announced by the Canadian Department of Marine and Fisheries. The lighthouse replaces a former gas beacon on the east side of Burnt Island. It is in the form of a rectangular wooden dwelling. The light is of fifty dioptric type and is shown at an elevation of 64 feet and is visible five miles.

## Building Notes

**Winnipeg.**—All tenders submitted to the Provincial Government for work on the new Parliament buildings have been rejected, it was announced this morning. Hon. T. H. Johnson, minister of public works, said that prices were too high, and the Government had decided to make certain changes in the plans to reduce the cost.

## Wood-Working

**Clarksburg, Ont.**—A. E. Pedwell's sawmill was recently destroyed by fire, the loss being estimated at \$4,000.

## New Incorporations

**The Rapid Tool & Machine Co.**, of Lachine, Que., have been incorporated with a capital of \$40,000.

**Toy Products of Canada** has been incorporated at Ottawa, with a capital of

\$50,000, to manufacture toys of all kinds at the Village of Farm Point, Que. The incorporators are: James S. Dingman, V. Leslie and A. E. Honeywell, of Ottawa.

**Fess Oil Burners, Ltd.**, has been incorporated at Ottawa, with a capital of \$100,000, to manufacture the oil burners and similar apparatus at Toronto. The incorporators are: William S. Morlock, R. H. Parmenter and S. D. Fowler, all of Toronto.

**Bishop Lumber Co.** has been incorporated at Toronto, with a capital of \$3,000,000, to operate saw mills and planing mills at Nestorville, Ont. The provisional directors are: Harry H. Bishop, H. William Bishop and Jesse A. Bishop, all of Chicago, Ill.

**The Canada Cleanser Co.** has been incorporated at Toronto, with a capital of \$100,000, to manufacture cleansers and cleaning compounds, etc., at Toronto. The provisional directors are: W. J. L. McKay, George H. Gray and David Lowrey, all of Toronto.

**The Houtp Paper Mills** has been incorporated at Toronto, with a capital of \$100,000, to manufacture paper of all kinds at Newburgh, Ont. Provisional directors are: Lewis F. Houtp and Wilber E. Houtp, of Buffalo, N.Y., and Edward A. Crippen, of Toronto.

**The Richam Mfg. Co.** has been incorporated at Toronto, with a capital of \$150,000, to manufacture automobile tires and accessories at Hamilton, Ont. The provisional directors are: George A. Truman, C. George Christopher and Arthur E. Wickens, all of Hamilton, Ont.

**The Russo-Canadian Mining Corporation** has been incorporated at Ottawa, with a capital of \$1,000,000, to carry on the business and operations of a mining, milling and reduction company. Head office is at Toronto, and the incorporators are: R. W. Hart, K. D. McKenzie and W. W. Perry, all of Toronto.

**International Metal Work, Ltd.**, have been incorporated at Ottawa, with a capital of \$30,000, to manufacture and deal in automobiles, aeroplanes, engines and motors, etc., at Brockville, Ont. The incorporators are: Thomas J. Storey, Walter G. Jarman and Ellery L. Wright, all of Brockville, Ont.

**Canada Light, Heat & Welding Co.** has been incorporated at Ottawa, with a capital of \$1,000,000, to carry on the business of a light, heat and welding company in all its branches, with head office at Toronto. The incorporators are W. B. Sturup, J. F. McGregor and J. W. Bicknell, all of Toronto.

## Catalogues

The "Gun" Tap is the title of an attractive booklet recently issued by the Greenfield Tap & Die Corporation, Greenfield, Mass. The bulletin describes in detail the principal features of the "Gun" tap covering its design and operation accompanied by illustrations featuring the claims made for this tap. The bulletin also shows results of several tests and contains instructions for grinding.

**Pumps.**—Bulletin, series G, No. 1 deals with the "Wood" screw type pump made by the D'Oliver Centrifugal Pump and Machine Co., Philadelphia, Pa. These pumps which are designed for irrigation and drainage service are described fully, special mention being made of their principal features while the advantages of the "Wood" screw type of pump are dealt with in detail. Results of tests are included with curves and illustrations.

The National Steam Pump Co., Upper Sandusky, Ohio, have issued two bulletins No. 20 and No. 21 dealing respectively with the "National" boiler feed pump and outside packed plunger pump. In addition to a general description of each type of pump the bulletins feature the balanced piston valve. The operation of this valve is fully described and a sectional drawing shows the general arrangement and its application. The principal dimensions and capacity of the various sizes of each type of pump are given.

**Refrigerating Machines**—Bulletin No. 42 A, deals with vertical enclosed single-acting ice making and refrigerating machines built by the York Manufacturing Co., York, Pa. The bulletin contains a detailed description of the "York" refrigerating machine accompanied by illustrations showing the various types and sectional views showing the general arrangement. A description is given of the evaporating system with diagrams showing plant layouts. Copies of this bulletin may be obtained from the Canadian Ice Machine Co., Toronto, selling agents for the "York" machines.

**Steam Traps.**—Bulletin "C" describes and illustrates the "Marek Therm" steam trap made by the E. F. Houghton & Co., Philadelphia Pa. The bulletin deals fully with the possibilities of the application of this trap to the automatic discharge of condensation from steam pipes, radiators and low pressure steam services generally. The application, construction and operation of this trap are described in a comprehensive manner while illustrations show

## I BELIEVE

In Safety First and always.  
In providing for the Health of my Fellow Workmen.  
In Light and Air and sanitary Working Conditions.  
In clean, fresh drinking water for everybody.  
In the Safety, Economy and Man-betterment.

**PURO** SANITARY DRINKING FOUNTAIN

(MADE IN CANADA)

The loss of a man through impure drinking water is a crime that "the front office" must bear.

An ugly statement, isn't it? But true, absolutely.

When a man comes to work in your factory he puts his health in your keeping.

Are you willing to take chances on such a trust?

Impure drinking conditions are responsible for more tragedies than any machine ever built.

Apply the "Safety First" Principles to your water supply; don't deny your men a clean, fresh drink of water.

Conserve their health and they will improve your profits; make yourself as worthy of the name of "employer."

Install the Gold Medal winner Puro in your plant, office and shop alike.

The only Sanitary Drinking Fountain that is safe, sanitary, simple, automatic in control and easily attached.

Let us tell you just what it will cost you to

the trap itself and also its application under various conditions. Interested readers may obtain copies of this bulletin by writing.

**Electric Motors.**—T. W. Broadbent Ltd., Huddersfield, England, have recently issued leaflet No. 3 of catalogue No. 5, dealing with their "M" type continuous current motors. The leaflet contains a specification covering the principal features of these motors together with illustrations while price tests and shipping weights are included for the various sizes. Copies of the leaflet may be had on application.

**Auto Starters** for squirrel-cage induction motors are the subject of circular No. H-7001 issued by the Canadian Westinghouse Co., Hamilton, Ont. The construction and principal features of these auto-starters are described fully, accompanied by several tables. The illustrations show different types of this apparatus and also wiring diagrams.

## Book Reviews

**Canadian Industry, Commerce and Finance** by J. J. Harpell, published by the Industrial and Educational Press, Ltd., Montreal and Toronto. This is a companion volume to "The Journal of Commerce" containing much valuable information for Canadian merchants and is particularly useful at the present time when so many firms are endeavoring to develop their export business. This book will give those business men not already familiar with such matters an opportunity to study certain features of commerce and finance which will well repay the time spent in acquiring the knowledge. It is a handy book of reference dealing with the subject in a concise manner and at the same time being an accurate source of information. The book contains six chapters, the first three dealing with industry, commerce and finance and includes maps of trade routes and Canadian ports. A useful feature of this volume is chapter 4 which consists of a trade index or directory of all marketable commodities and Canadian producers, the former being arranged alphabetically. Chapter 5 contains a list of foreign manufacturers of special machinery and supplies necessary to Canadian industry importers, manufacturer agents, wholesale houses, wholesale dealers and exporters. The concluding chapter contains a list of institutions, such as banks, insurance companies, and engineers, etc., in Canada. The book contains 131 pages printed in clear type and is bound in substantial covers.

**QUANTITY  
PRODUCER**

This tool is used in shops where parts are keyseated by thousands. It is fitted with a high-speed steel rotary cutter for milling internal keyseats in one cut. Shops large and small can use the tool, and it is readily attached to a drilling machine for which it is designed. The tool keyseats in places where Keyseating Machine, Planer and Shaper can't reach. The right tool to use for keyseating interchangeable parts. There is no limit to the variety of work possible to be keyseated.

of Economics in the University of Vermont. The MacMillan Company, Toronto and New York. 494 pages.

This is a teacher's book for students—ample, orderly and thorough. Its contents are indicated by its chapter divisions: The Background; The Structure; Collective Bargaining; Political Activity; Transitional Stages; Suggestions for Further Reading is a valuable feature.

Organized labor in Europe and America is a social phenomenon; a token of emancipation. It is indicative of a new social psychology. The organized labor movement cannot be "downed." It is as inevitable as organized capital, and its objective is the same: namely, group or class betterment.

In the book under review the author has confined his treatment to that phase of the labor movement which is organized labor. His material is concerned chiefly with the activities of the unions, but he describes also the background of the labor movement and the current forms of association and gives an account of transitional movements.

Wage Theories, Modern Industrialism, The Knights of Labor, The American Federation of Labor, The American Trade Union, Women and Unionism, The Strike, Arbitration, The Boycott, The Closed Shop, The Trade Agreement, Restriction of Output, Legislative Methods, Labor Legislation, Political Labor Party—these suggest the line of study and treatment.

The war has revealed the power of organized labor in Great Britain as nothing else ever did, showing it to be a force to be reckoned with by governments and statesmen; and when the war is over organized labor is bound to receive a recognition by capital not willingly accorded it in the past. The enmity between capital and organized labor so long continued, so bitter in its expression, so calamitous in its fruitage, rests to some extent on misunderstandings, and to a larger extent on the failure of both sides to recognize the other side's point of view and rights. That there is antagonism of interest there is not a doubt, but at bottom the conflict is based on the first law of life—self-preservation or protection. The new industrialism which will follow the war; and the new economic conditions brought about by trade pacts, man-shortage, emigration, and consequent new social conditions, call for a coming together in mutual accord and purpose of capital and labor. Better relationships can be established only when there is a better understanding of the organized labor movement, and a closer study and analysis of social mechanics. Professor Groat's book is a timely volume.

## ACCESSIBILITY: A Prominent "New Britain" Feature

**I**N the construction of many tools, access to parts requiring frequent change or adjustment often fails to receive sufficient attention.

The importance attached to this feature by the designers of the "New Britain" Automatic is evidenced by the many provisions for greatest convenience and economy of time in setting up and operating the machine.

A loose cover in cylinder housing permits of instant access to spindle bearing adjusting nuts.

The design of the spindle bearings—straight inside and taper outside—enables the slightest wear to be taken up without disturbance of the original alignment of spindle.

Should it become necessary for any reason to remove a spindle, it may be accomplished without removal of spindle cylinder. If, however, it is desirable to take out the latter all that is necessary is to remove upper half of cylinder housing and withdraw drive shaft.

In effecting variations of spindle speed or feed, the "New Britain" design is exceptionally simple and convenient: the necessary gear changes being made without removal of driving pulley.

A feature adding greatly to the ease of removal of chips is embodied in the design of the base. That portion directly beneath the work has a 45° slant toward the side of the machine, so that chips and work as cut off are carried to the side. The chip pan is widest on this side and slopes toward the rear, where there is an oil well with strainer from which oil is distributed to the work. This construction permits the oil to thoroughly drain off before chips are removed and makes it possible to rake out chip pan endwise without stopping machine or removing splash apron.

## FOR SALE

**16 H.P. IDEAL GAS ENGINE — ALSO** quantity of pulleys. Chipman & Millman, Brantford, Ont. (16)

**HORIZONTAL GAS ENGINE 25 H.P. IN SERVICE** at present time, \$375.00 cash. Write Penberthy Injector Co., Limited, Windsor, Ontario. (5)

**FOR IMMEDIATE SALE, TORONTO—3,000** feet seamless steel tubing, 1½" O.D. by 5-32" wall. No reasonable offer refused. Box 327, Canadian Machinery. (15)

**FOR SALE—2 2" MURCHEY COLLAPSIBLE** taps for nosing shells; 1 No. 6 2" collapsible tap; maker, The Manufacturers' Equipment Co. McGregor & McIntyre, Toronto, Ont. (14)

**FOR SALE — STEEL WATER TOWER,** without tank, 94 feet high. Will support tank holding 13,000 gallons. Cost new \$1,600.00. Will sell for \$350.00 f.o.b. Shawinigan Falls, P.Q. Northern Aluminum Company, Limited.

**A SNAP IN TURRET LATHES SLIGHTLY** used on shell work. Fourteen splendid machines at bargain prices. Do you need these machines? If so, drop a line to Box 953, Woodstock, Ont.

**LATHE FOR SALE—ONE 39 x 17-FOOT** Pond engine lathe, suitable for heavy shells; in good condition; \$1,500.00. A. B. Ormsby Company, Limited, Toronto. (2)

**A BARGAIN FOR QUICK SALE—30 H.P. 10 x 14 engine;** guaranteed in first-class working condition; drive belt included. Hamilton Whip Co., Hamilton.

## For Sale Cheap

- 1-Box Girder Type Overhead Hand Power Crane, 48' 6" span, 5 tons capacity; complete, less the Hoist. This is a good Crane for Foundry, Boiler Shop, Storehouse, Stone Yard, etc.
- 1 12" Single "I" Beam Overhead Hand Power Crane, 30' 10" span, 4 tons capacity; complete, less the Hoist.
- 1 Brantford (Gas) Bake Oven and 4 Racks.
- 1 Linderman 2-Spindle Boring Machine.
- 1 20" Drill, Bertram Company.
- 1 20" Drill, London Machine Tool Company.
- 1 Bowser 40 Gal. Varnish or Oil Pump and Tank.

**M. BEATTY & SONS**  
Limited  
Welland, Ont.

**BUSINESS FOR SALE — MACHINE SHOP** with a good, steady run of work and always busy. A good opening for a young man to get into business. Owner has other interests. Box 224, Canadian Machinery. (12)

**1-2-SPINDLE SHAPER, WOOD TOP, JOHN** Ballantyne, Preston, make. used two months. 1 Dynamo, 45 lights, Toronto and Hamilton Electric Co. make. Used five months. Good as new. Box 195, Jordon, Ont. (R.T.F.)

**DROP PRESS FOR SALE—NO. 9 MINER & Peck** drop press; anvil 2,000 lbs.; base 30,000 lbs.; 36" between uprights; 40" x 35" between poppets; 34" x 20" top of anvil; guaranteed as good as new. Can be shown in operation to any genuine prospective buyer. The Metallic Roofing Co., Limited, Toronto. (4)

**MACHINE SHOP WITH MODERN EQUIP-**ment manufacturing a good staple line; orders for months ahead; will bear the fullest investigation; satisfactory reason for selling. Box 220, Canadian Machinery.

**ONE REED TURRET LATHE, 8' BED,** swing 28"; 4 2" holes in turret. This machine is in first-class condition and was only used on 3,000 shells. Is a very powerfully built machine and will bear fullest investigation. Box 226, Canadian Machinery. (16)

**FOR SALE—ONE 16" X 8' HENDEY LATHE,** with taper attachment, \$1,100.00; one 22" x 10' Blaisdell lathe, with taper attachment, \$1,200.00; one 24" Gould & Eberhardt shaper, \$800.00. The above machines are in first-class condition. For particulars apply Box 221, Canadian Machinery.

**FOR SALE—BOILER REPAIR AND SHEET** iron works. Fine opening, one of the best in Canada, for a good man. Only repair shop in county. Equipment alone will list at nearly \$2,000. Will sell for \$1,200. Write for particulars. Box 213, Canadian Machinery.

**FOR SALE — SOIL PIPE AND FITTING** plant; full range medium patterns; good assortment, standard and extra heavy; ten-ton cupola; complete modern equipment, with machine shop; on 2 acres land; railway siding. Would give lease of land now occupied. Reasonable price and easy terms. Fine opportunity for two or three practical foundry men. Apply The Vancouver Pipe and Foundry Co., Ltd., 672 Beatty Street, Vancouver, B.C.

**WE HAVE FOR SALE THE FOLLOWING** equipment: Complete nickel and copper plating plant, including direct connected dynamo and motor; one second operation cast iron plug machine, and two first operation cast iron plug machines manufactured by the Brown Engineering Corporation; 2 16-inch turret lathes; 1 38-inch engine lathe, 20-foot bed. The above outfit will be sold en bloc or separate. Apply direct to Foundry & Machine Co., Ltd., Montreal. (12)

**FOR SALE—McDOUGALL ENGINE LATHE,** 20" swing, 10' bed; never been used. Baker Keyseater No. 2, good as new. Boring Mill, 2 bars, will bore up to 30" dia. Boston Forge Blower, 27", good condition. Crescent Swing Cut-off Saw, almost new. 7½ H.P. Westinghouse D.C. Motor, in good order. Gurney Platform Scale, 2,000 lb., 16" wheels. Mandrills, Couplings, Hangers, Post Boxes, Pulleys, Belting, Cap Screws, Bolts, etc. Special prices on above, write for particulars. Winnipeg Machinery Exchange, Sutherland and Gladstone Sts., Winnipeg, Man. (14)

## WANTED

Burned out Tungsten Lamps, late type, drawn wire, 25, 4), 60 and 100 Watts, 110 and 115 volts.

**DOMINION TUNGSTEN LAMP FACTORY**  
[ ST. CATHARINES, ONTARIO

## SITUATIONS WANTED

**TOOL MAKER IN CHARGE DESIRES** change. Competent to take charge of machine shop or tool room. Good references. Box 225, Canadian Machinery. (17)

**SUPERINTENDENT OF SHELL FACTORY** desires position—at present employed, but wishes to change. Would accept general foremanship. Best references. Box 217, Canadian Machinery. (9)

**SUPERINTENDENT—FIRST-CLASS PRACTICAL** mechanical man is open for an engagement as works manager or superintendent. Can give best of reference as to character and ability to handle help and produce results. Box 227, Canadian Machinery.

## WANTED

**WANTED — 250-VOLT D.C. GENERATOR —** 75 to 150 k.w., direct connected to steam engine; must be in good condition. Write to The Kaufman Rubber Co., Berlin, Ont. (13)

**WANTED—ELECTRIC TRAVELLING GAN-**try crane, span about 57 ft., clearance 50 ft., overhanging at one end; load 15 tons. State full particulars and price. Thor Iron Works, Limited, Toronto, Ont. (27)

**WANTED—12" BAR ROLLING MILL TWO** or three high with steam drive. One three-ton Steam Hammer. One half-ton Steam Hammer. One pair Rolling Mill Shears. With full particulars and lowest price. Apply Box 218, Canadian Machinery.

## REPAIRING

**ALL KINDS OF MACHINERY REPAIRED,** rebuilt and installed. W. H. Sumbing Machinery Co., 643 Yonge Street, Toronto, Ont.

# Foundrymen's Convention and Equipment Exhibition

## Staff Article

*The Conventions of the American Foundrymen's Association and American Institute of Metals with their affiliated Exhibition held recently in Cleveland, Ohio, were featured by record attendances, and by a high standard of papers read and discussed at the various sessions. The Exhibition was an unqualified success from every standpoint, and was fully indicative of the remarkable progress made in foundry equipment and operation in recent years.*

THE 21st Annual Convention of the American Foundrymen's Association was held at Cleveland, Ohio, during the week of September 11th. As usual, joint and also independent simultaneous sessions were held with the American Institute of Metals. The exhibition of foundry equipment and supplies, and machine tools which was formerly conducted by an independent corporation, was this year held under the joint management of the two associations. The first exhibition of foundry equipment and supplies took place in Cleveland in 1906, being the last time it and the convention were held in that city until the present year. This in itself was an interesting feature as it served to show the remarkable progress which has been made in the foundry industry during the intervening period.

### Exhibition Feature.

The convention was held in the Hotel Statler, and the exhibition at the

Wigmore Coliseum where 60,000 square feet of floor space was available for exhibitors. This space however was inadequate owing to the popularity of the exhibition, so an annex with 10,000 square feet space was erected on vacant ground adjoining the main building. All the available space was occupied, the number of exhibitors being 150. The exhibition was a complete success both as regards attendance and character of exhibits. It was the largest exhibition of foundry equipment and supplies that has ever been held in the United States. The exhibit included all types of modern foundry equipment, both heavy and light, stationary and in operation; general metal working machinery, cutting and welding equipments, pattern lumber, office specialties, coke, pig iron, non-ferrous metals, etc. The whole made a very attractive and interesting display, complete in that it included everything that is required and employed in the foundry. A

noticeable feature brought out in the exhibit was the increasing tendency towards labor saving and reduction of operating costs.

### Convention Feature

The convention opened on Monday, September 11th, at the Hotel Statler, with a record attendance, the afternoon session being devoted to the annual addresses by president R. A. Bull of the American Foundrymen's Association and president Jesse L. Jones of the American Institute of Metals.

A new departure was inaugurated this year in order to permit of a closer inspection of the exhibits and participation in the entertainment features without encroaching on the technical sessions as in the past. The arrangement consisted of having one meeting per day, in the morning, leaving the afternoons free for other purposes. Joint sessions were held on Monday and Tuesday mornings, these being followed by

GENERAL VIEW OF EXHIBITS IN ANNEX

separate meetings of the two organizations on Wednesday, Thursday and Friday mornings.

The program of the American Foundrymen's Association was most complete. It contained three interesting symposiums, forty papers and addresses

sion on Thursday, while on Friday papers were read on physical tests, metallography, etc. The final meeting of the two organizations was a joint session held on Friday when the new officers were installed and the convention finally closed. A proposal to amal-

inghouse Electric & Mfg. Co., Cleveland, vice-president; A. O. Backert, Penton Publishing Co., Cleveland, secretary-treasurer. The remaining members of the board of directors are as follows: R. A. Bull, Granite City, Ill.; Henry A. Carpenter, Providence, R. I.; Alex. T. Drysdale, Burlington, N.J.; C. E. Hoyt, Chicago; Alfred E. Howell, Nashville, Tenn.; W. A. Janssen, Davenport, Ia.; S. T. Johnston, Chicago; V. E. Minich, New York City; Jos. T. Speer, Pittsburgh; H. B. Swan, Detroit; S. G. Fagg, Philadelphia, and S. B. Chadsey, Toronto, Ont

#### New Officers, A.I.M.

The American Institute of Metal elected the following officers for the ensuing year: President, Jesse L. Jones, Westinghouse Electric & Mfg. Co., Pittsburgh, second term; secretary, W. M. Corse, Titanium Alloy Mfg. Co., Niagara Falls, N.Y.; senior vice-president, George C. Stone, New Jersey Zinc Co., Palmerston, N.J. Other vice-presidents are: R. S. B. Wallace, National Cash Register Co., Dayton, O.; W. B. Price, Scovill Mfg. Co., Waterbury, Conn.; George K. Burgess, bureau of standards, Washington; DeCourrey Brown, Goldsmith Thermit Co., New York City; Harold J. Roast, James Robertson Co., Montreal; J. P. Salter, Ohio Brass Co., Mansfield, O.; F. H. Schultz, H. B. Mueller Co., Decatur, Ill.; W. A. Cowan, National Lead Co., New York City, and H. S. Gulick, Moore Brass & Metal Co., St. Louis.

#### Plant Visitations.

The arrangement whereby all sessions were held in the morning left the rest of the day free for visits to plants in

VIEW OF EXHIBIT NEAR MAIN ENTRANCE TO COLISEUM

and eleven committee reports. General topics were considered on Wednesday, followed by steel and malleable sessions on Thursday and gray iron and steel on Friday. The program of the American Institute of Metals was also very complete. Tuesday was devoted to a joint session with the American Foundrymen's Association while in addition, the program contained twenty-one papers on all phases of brass foundry and rolling mill work. Brass foundry practice was discussed on Wednesday, heat treatment and corro-

gamate the two associations was defeated. The executive committee of the American Institute of Metals reporting the matter, expressed the fear that amalgamation of the two bodies might result in less prominence of the organization which has now a membership of 350.

#### New Officers, A.F.A.

The American Foundrymen's Association elected the following officers for the ensuing year. J. P. Pero, Missouri Malleable Iron Co., St. Louis, president; Benjamin D. Fuller, West-

GENERAL VIEW OF EXHIBITS NEAR MAIN ENTRANCE TO COLISEUM

the district, a closer inspection of the exhibits at the Coliseum, and other relaxations. As Cleveland ranks third in the United States in the number of foundries within the city limits, a great opportunity was thus afforded to witness operations in modern plants. Al-

house Electric & Mfg. Co., Cleveland.  
 "Steel," by William Gilmore, Hubbard Steel Foundry Co., East Chicago, Ind.  
 "Malleable Iron," by A. M. Fulton, Fort Pitt Malleable Iron Co., Pittsburgh.  
 "Non-Ferrous Metals," by R. R. Clarke, Pennsylvania Lines West, North Side, Pittsburgh.  
 "Waste Foundry Sand," by H. B. Swan, Cadillac Motor Car Co., Detroit, and H. M. Lane, consulting engineer, Detroit.

VIEW IN THE SOUTH-EAST CORNER OF THE COLISEUM

though plant visitation was limited to two days, Thursday and Friday, a considerable number of visitors availed themselves of the opportunity of an inspection of the Cleveland Furnace Co. plant on Wednesday afternoon. The inspection of plants by visitors was arranged for at appointed hours on the two days named. The most modern shops in the city were selected and those visited included:—The Ferro Machine & Foundry Co.; Interstate Foundry Co.; Westinghouse Electric & Mfg. Co.; West Steel Casting Co.; City Foundry Co.; and the Best Foundry Co., of Bedford, Ohio.

#### Entertainments.

The entertainment program included a ball game between the Cleveland and Detroit teams of the American League on Tuesday afternoon; a theatre party on Tuesday evening, and a trip to Euclid Beach Park on Wednesday night. The banquet was held at the Hotel Statler on Thursday evening and was attended by about 460 guests. The principal address was delivered by Newton D. Baker, U.S. Secretary of War, while Irving Bacheller the noted poet and novelist delivered a humorous talk on "The Cheerful Yankee."

#### Convention Papers, A.F.A.

Symposium on "The Results of Closer Co-Operation Between the Engineer and the Foundry," as relating to:

"Gray Iron," by D. W. Sowers, Sowers Mfg. Co., Buffalo.  
 "Steel," by John Howe Hall, Taylor-Wharton Iron & Steel Co., High Bridge, N.J.  
 "Malleable Iron," by G. F. Meehan, Ross-Meehan Foundries, Chattanooga, Tenn.  
 "Non-Ferrous Metals," by C. E. Chase, Modjeski & Angler, Chicago.  
 Symposium on "The Influence of Gating on Castings," covering:  
 "Gray Iron," by B. D. Fuller, Westing-

"Report of Work on Molding Sand," by S. W. Stratton, director, U. S. Bureau of Standards, Washington, D.C.

"The Significance of the Fire Waste," by Franklin H. Wentworth, secretary, National Fire Protection Association, Boston.

"What the Pratt Institute Has Done, Is Doing and Hopes to Do, in the Training of Men for the Foundry Industry," by Samuel S. Edmunds, Pratt Institute, Brooklyn.

"Analyzing Foundry Operations as a Basis for Improvement in Shop Conditions," by R. E. Kennedy, University of Illinois, Urbana, Ill.

"Foundry Work at the University of Nebraska," by John Grenman, University of Nebraska, Lincoln, Neb.

"Foundry Costs," by Clinton H. Scovell, Clinton H. Scovell & Co., Boston.

"Profit-sharing as a Factor in Preparedness," by C. E. Knoeppel, C. E. Knoeppel Co., New York.

"How Some Cleaning Room Problems Have Been Solved," by H. Cole Estep, The Foundry, Cleveland.

"The Introduction of the Molding Machine in Foundries," by A. O. Backert, Penton Publishing Co., Cleveland.

Symposium on "Electric Furnace Practice":  
 "The Ideal Electric Furnace for the Steel Foundry," by F. J. Ryan, E. B. McKee and W. D. Walker, Snyder Electric Furnace Co., Chicago.

"The Electric Furnace in the Foundry," by E. B. Clarke, Buchanan Electric Steel Co., Buchanan, Mich.

"Gronwall-Dixon Electric Melting and Refining Furnace," by John A. Crowley, John A. Crowley Co., New York.

"Electric Furnace Practice in the Manufacture of Steel Castings," by T. S. Quinn, Lebanon Steel Foundry, Lebanon, Pa.

"Electric and Converter Steel Compared," by Peter Blackwood, Blackwood Steel Foundry Co., Springfield, O.

"The Manufacture of Manganese Steel Castings," by W. S. McKee, American Manganese Steel Co., Chicago.

"The Presence of Alumina in Steel," by G. F. Comstock, Titanium Alloy Mfg. Co., Niagara Falls, N.Y.

#### Malleable Session.

"The 25-Ton Air Furnace," by F. C. Rutz, Rockford Malleable Iron Works, Rockford, Ill.

"What is the Normal Fracture of Good Malleable Iron?" by Enrique Touceda, Albany, N.Y.

"The Commercial Side of the Malleable Iron Industry," by W. G. Krausz, National Malleable Casting Co., Cleveland.

"The Application of Malleable Iron Castings in Car Construction," by Frank J. Lanahan, Fort Pitt Malleable Iron Co., Pittsburgh.

"Suggested Standards for Pattern Parts," by W. W. Carlson, Kansas State Agricultural College, Manhattan, Kan.

#### Gray Iron Session.

"The Effects of Different Mixtures on the Strength of Chilled Car Wheels," by G. S. Evans, Lenoir Car Works, Lenoir City, Tenn.

"Semi-Steel Classified," by David McLain, McLain's System, Milwaukee.

"Use of By-Product Coke in Foundries," by George A. T. Long, Pickands, Brown & Co., Chicago.

"The Use of Borings in Cupola Operations," by James A. Murphy, Hooven, Owens & Rent-schler Co., Hamilton, O.

"The Use of Cheaper Materials," by C. C. Kavin, Charles C. Kavin Co., Chicago.

"One-third of a Century in a Gray Iron Foundry," by Alfred E. Howell, Phillips & Buttorff Mfg. Co., Nashville, Tenn.

"Thermal Reactions in Gray Iron," by Thomas Turner, The University, Birmingham, Eng.

"Application of the Match-Plate to Foundry Work," by J. K. Grill, International Harvester Co., Chicago.

#### Steel Session.

"The Use of Titanium in the Manufacture of Steel Castings," by W. A. Janssen, Bettendorf Co., Davenport, Ia.

"Acid Versus Basic Steel for Making Castings," by E. F. Cone, The Iron Age, New York.

"Alloy Steel Castings," by David Evans, Chicago Steel Foundry Co., Chicago.

"Theory and Practice in Gating and Heading Steel Castings," by Ralph D. West, West Steel Casting Co., Cleveland.

"The Small Open-Hearth as a Flexible Unit for Either Large Steel Foundries or General Jobbing Shops," by Frank Carter, Milwaukee, Wis.

#### CONVENTION PAPERS, A.I.M.

Symposium on "The Results of Closer Co-Operation Between the Engineer and the Foundry," as relating to:

"Gray Iron," by D. W. Sowers, Sowers Mfg. Co., Buffalo.

VIEW IN NORTH AISLE OF COLISEUM

"Steel," by John Howe Hall, Taylor-Wharton Iron & Steel Co., High Bridge, N.J.

"Malleable Iron," by G. F. Meehan, Ross-Meehan Foundries, Chattanooga, Tenn.

"Non-Ferrous Metals," by C. E. Chase, Modjeski & Angier, Chicago.

Symposium on "The Influence of Gating on Castings," covering:

"Gray Iron," by B. D. Fuller, Westinghouse Electric & Mfg. Co., Cleveland.

"Steel," by William Gilmore, Hubbard Steel Foundry Co., East Chicago, Ind.

"Malleable Iron," by A. M. Fulton, Fort Pitt Malleable Iron Co., Pittsburgh.

"Non-Ferrous Metals," by R. R. Clarke, Pennsylvania Lines West, North Side, Pittsburgh.

"Waste Foundry Sand," by H. B. Swan, Cadillac Motor Car Co., Detroit, and H. M. Lane, consulting engineer, Detroit.

"The Significance of the Fire Waste," by Franklin H. Wentworth, secretary, National Fire Protective Association, Boston.

"What the Pratt Institute Has Done, Is Doing and Hopes to Do, in the Training of Men for the Foundry Industry," by Samuel S. Edmunds, Pratt Institute, Brooklyn.

"Analyzing Foundry Operations as a Basis for Improvement in Shop Conditions," by R. E. Kennedy, University of Illinois, Urbana, Ill.

"Foundry Work at the University of Nebraska," by John Grenman, University of Nebraska, Lincoln, Neb.

#### Foundry Practice.

"Twenty-Five Years' Experience in the Brass Foundry," by E. A. Barnes, Fort Wayne Electric Co., Fort Wayne, Ind.

"Evolution of the Die Casting Process," by Charles Pack, Doehler Die Casting Co., Rochester, N.Y.

"How a Large Manufacturing Concern Disposes of Its Old Metal," by J. M. Bateman, Western Electric Co., Cleveland.

"The Reclamation of Brass Ashes," by Arthur F. Taggart, Hammond Laboratory, Yale University, New Haven, Conn.

"The Small Leaks of a Brass Foundry," by Charles T. Bragg, Ohio Brass Co., Mansfield, O.

"The Application of the Oxy-Acetylene Welding Process in the Repair of Defective Non-Ferrous Castings," by S. W. Miller, Rochester Welding Co., Rochester, N.Y.

"Alloys to Withstand Internal Air Pressure," by S. D. Sleeth, Westinghouse Air Brake Co., Wilmerding, Pa.

"Making Thin-Walled Castings," by R. S. B. Wallace, National Cash Register Co., Dayton, O.

#### Heat-Treatment, Corrosion, Etc.

"Deterioration of Muntz Metal," by H. S. Rawdon, United States Bureau of Standards, Washington, D.C.

"The Initial Stress Produced by the Burning-In of Manganese Bronze," by Paul D. Merica and C. P. Karr, United States Bureau of Standards, Washington, D.C.

"A Curious Case of Corrosion of Tinned Sheet Copper," by Paul D. Merica, United States Bureau of Standards, Washington, D.C.

"Notes on the Occurrence and Significance of Tinned Crystals in Electrolytic Copper," by H. S. Rawdon, United States Bureau of Standards, Washington, D.C.

"The Annealing Properties of Copper," by G. V. Caesar and G. C. Gerner, Hammond Laboratory, Yale University, New Haven, Conn.

"Some Uses and Properties of German Silver as Applied to the Optical Trade," by G. C. Holder, American Optical Co., Southbridge, Mass.

#### Physical Tests, Metallography, Etc.

"Aluminum Castings and Forgings," by P. E. McKinney, United States Navy Yard, Washington, D.C.

"Copper-Aluminum-Iron Alloys," by W. M. Corse, Titanium Alloy Mfg. Co., Niagara Falls, N. Y.

"Physical Tests on Common High Brass Taken Parallel and at Right Angles to the Direction of Rolling," by William B. Price and Philip Davidson, Scovill Mfg. Co., Waterbury, Conn.

"Seasoning Cracks and the Self-Annealing of Brass," by W. Arthur, Frankford Arsenal, Frankford, Philadelphia.

"Co-operation with the Metal Industries in Metallographic Work," by C. H. Mathewson, director, Hammond Laboratory, Yale University, New Haven, Conn.

#### Exhibitors, Exhibits and Representatives.

Ajax Metal Co., Philadelphia, Pa.—Ingots of various metals manufactured. Represented by G. H. Clamer, first vice-president and sec-

retary; C. F. Hopkins, general works manager; F. M. Willeson, New England and New York State manager; C. E. McKee, Detroit representative, and L. E. Funnell, Pittsburgh representative.

Alexander Bros. Lumber Co., Cleveland.—Pattern and flask lumber specialists. Represented by H. L. Spittler, vice-president, and M. F. Fitzgerald, secretary.

Amalgamated Machinery Corporation, Chicago.—No. 23 Shell Boring Machine. Represented by N. A. Mears.

American Foundry Equipment Co., Cleveland, O.—For description of Exhibit see Sand Mixing Machine Co.

American Gum Products Co., New York.—Goulac Core Binder. Represented by Gordon I. Lindsay, general manager; W. E. Baird, manager foundry department; John F. Gaffney, R. H. Mills and U. W. Friuk.

American Foundrymen's Association, Department of Safety.—Victor T. Noonan, Director of Safety of the Industrial Commission of Ohio, chairman. Exhibit of safety and welfare work in foundries and shops. Loaned by the National Safety Council.

American Molding Machine Co., Terre Haute, Ind.—Jolting machine. Represented by W. C. Norcross, president, and Glen B. Hastings, western representative.

Arcade Manufacturing Co., Freeport, Ill.—Twenty-four inch roll-over machine, piston machine, joint stripper, No. 2 modern molding machine, core joint machine, 8-inch air squeezer, No. 90 combined joint and squeezer and No. 2 hand squeezer. Represented by E. H. Morgan, president; Chas. Morgan, vice-president; L. L. Munn, secretary; Henry Tschering, master mechanic; R. E. Turnbull, August Christen and G. D. Wolfley, representatives.

Armstrong Cork Co., Pittsburgh, Pa.—Nonparell insulating brick for furnaces, ovens, blast mähns, boiler settings, etc. Nonparell high pressure covering for steam lines, boilers, feed water heaters, etc. Nonparell cork covering for drinking water lines, tanks, etc. Linoleum for office floors. Represented by P. W. Lamson, Cleveland district manager, and E. C. Lloyd, sales engineer.

E. C. Atkins & Co., Inc., Indianapolis, Ind.—Saws for all purposes, particularly metal cutting saws for all classes of metals and types of sawing, such as circular metal cutting saws, friction discs, metal cutting band saws, hand and power hack saws and frames, saw fitting tools and Kwik Kut power hack saw machines. Represented by T. H. Endicott, special metal saw representative, Thomas A. Carroll, trade service department, and A. Mertz, Ohio metal saw representative.

Ayer & Lord Tie Co., Inc., Chicago.—A. & L. Interior creosoted wood block floor. Represented by A. H. Noyes, secretary and treasurer; W. H. Blythe, F. W. Maechler, B. S. McConnell, S. C. Conway, and R. G. Inslee.

B. & B. Mfg., Indianapolis, Ind.—Thirty-inch hand jar and squeeze machine, 30-inch power squeezer and 24-inch power squeezer, and W. J. Parker.

Beighlee Electric Co., Cleveland, O.—Beighlee indicating and recording pyrometer equipment. Represented by W. H. Chappel, secretary, and W. O. Little, New York representative.

Berkshire Mfg. Co., Cleveland.—Automatic molding machine, air and hand squeezer molding machines, joint and squeeze molding machines, vibrators, etc. Represented by R. H. York, president; W. A. Price, treasurer; C. L. V. Evans, assistant treasurer; W. D. Fraser, manager; F. Hulec and G. L. Cannon, representatives.

Charles H. Besly & Co., Chicago.—Represented by Edward P. Welles, president; Charles A. Knill, Ralph W. Young, Leo E. Jacobs and George Klemp.

S. Birkenstein & Sons, Chicago.—Non-ferrous metals. Ingot copper, pig tin, spelter, lead, antimony, bismuth, manganese bronze, phosphor bronze ingots, brass ingots. Castings made from special alloys showing working qualities. Represented by Harry Birkenstein, member of firm; Lee Kahn, metallurgical director; M. Schero, and Chas. B. Raphael, salesmen.

Blystone Mfg. Co., Cambridge Springs, Pa.—Core sand mixer with screen and motor attached, and power dump. Represented by W. J. Pees, president, and Luther G. Conroe, general manager.

Brass World Publishing Co., New York.—Brass World & Plater's Guide, and technical books relating to the foundry trade. Represented by C. N. Manfred, business manager; George K. Meyers, M. G. Rosenthal and S. E. Rosenthal.

Brown Hoisting Machinery Co., Cleveland.—Tramrail equipment with switch, turntable,

trolleys and chain hoist. Hand traveling crane with trolley and hoist. Represented by A. R. Leeds and E. D. Johnson.

Brown Specialty Machinery Co., Chicago.—Hammer core machines, electric duplex shaker and revolving barrel sand blast machine. Represented by E. A. Rich, Jr., president; J. E. Sweet, sales manager; John Laycock, factory superintendent, and A. G. Coburn, mechanical superintendent.

Buckeye Products Co., Cincinnati, O.—Parting compounds, vibrators, high temperature furnace cement, core compounds, metal fluxes, patent snap flask guides and metal melting furnaces. Represented by C. J. Gehringer, president; D. S. Marfield, secretary; R. B. Ferguson, B. Bernbaum, C. S. Wegert, C. Gysin, J. B. Carpenter and A. J. Johnson, representatives.

Campanha Bralsieira de Matallurgia, Buffalo, N.Y.—Sensand-Arens process for casting pipe. Represented by A. Arens and D. L. Savard.

Carborundum Co., Niagara Falls, N.Y.—Carborundum and Aloxit products, including Carborundum and Aloxit wheels, Carborundum rub bricks, Carborundum and Aloxit cloth discs, Carborundum sharpening stones, Carborundum grains and powders and Carborundum firesand. Represented by C. E. Hawke, sales manager; G. T. Estabrook, Cleveland sales manager; W. U. Parrott, C. W. Barden and W. Walters, O. C. Dobson, C. D. Sargent, and T. B. Woodrow, representatives.

Cataract Refining & Mfg. Co., Buffalo, N.Y.—"Bison" core oils and compounds—parting. Cores and castings made with use of above cutting lubricants, cutting oils. Operating "bolt-cutter" using "Acme" cutting lubricant. Represented by H. C. Hutchins, vice-president; J. E. Chism, assistant to vice-president; J. Purvis, Jr., sales manager, core oil department; D. L. Baldwin, western sales manager, Chicago; E. P. Hughes, central sales manager, Detroit; A. A. Schaefer, eastern sales manager, New York; E. H. Coburn, T. E. Kenefick, H. C. Newton, C. W. Seibold and W. E. Williams, A. C. Breese, F. E. Deacon, R. M. Hiltch, R. L. Middleditch, F. N. Tweedy and G. W. Zimmerman.

Champion Foundry Machinery Co., Chicago.—Champion Electric Sand Riddles in operation. Represented by Henry O. Magnuson, president and secretary; Anton Magnuson, vice-president and treasurer; W. B. F. Magnuson, salesman.

Chicago Eye Shield Co., Chicago.—Eye protectors of all kinds. Represented by Robert Malcolm and Dr. Herman Brennecke.

Chicago Pneumatic Tool Co., Chicago.—Chicago air compressor, Keller rammers, Keller and Chicago chipping hammers, pneumatic geared hoists, Duntley electric drills, Chicago hose couplings, Little Giant grinders and Little Giant air drills. Represented by J. G. Osgood, vice-president; A. C. Andresen, T. D. Slingman, T. G. Smallwood, L. J. Wakefield, C. D. Smith and L. E. Summers, manager Detroit plant.

Cincinnati Pulley Machinery Co., Cincinnati, O.—Avey ball bearing sensitive drilling machines, motor driven, in operation. Represented by L. Patterson, president; J. G. Hey, vice-president and general manager; C. K. Cairns, sales manager; J. F. Mirrieles, superintendent, and D. A. Patterson, operator.

Charles J. Clark, Chicago.—The Clark blast meter. Represented by Charles J. Clark.

Cleveland Blow Pipe & Mfg. Co., Cleveland.—Dust collecting system for the removal of dust from emery polishing and buffing wheels, consisting of motor driven exhaust fan, dust trap, galvanized pipe, elbows and various types of hoods, sheet metal shower bath, copper spraying can and photographs. Represented by Edward Coney, manager, and E. E. Toth, secretary.

Cleveland Pneumatic Tool Co., Cleveland.—Riveting hammers, chipping hammers, air drills, corner drills, compound drills, rotary drills, angle gears, holder-ons, corebreakers, sand rammers, valve grinders, emery grinders. Bowes air hose couplings, Never Slip hose clamps, veribest air hose, hose clamp tools, etc. Represented by Claus Grove, president; H. S. Covey, secretary; L. W. Greve, treasurer; Geo. H. Hall, assistant treasurer; John DeMooy, assistant sales manager; Arthur Scott, superintendent; J. T. Graves and W. L. Orton, salesmen.

Cleveland Tool & Supply Co., Cleveland, O.—Dealers in machinery, factory, mills and plating supplies, and seamless steel tubing. Represented by Robert Locker and W. B. Pleadwell.

Cleveland Wire Spring Co., Cleveland.—Steel barrels, steel boxes, waste cans, steel racks, stools and steel core trays. Represented by

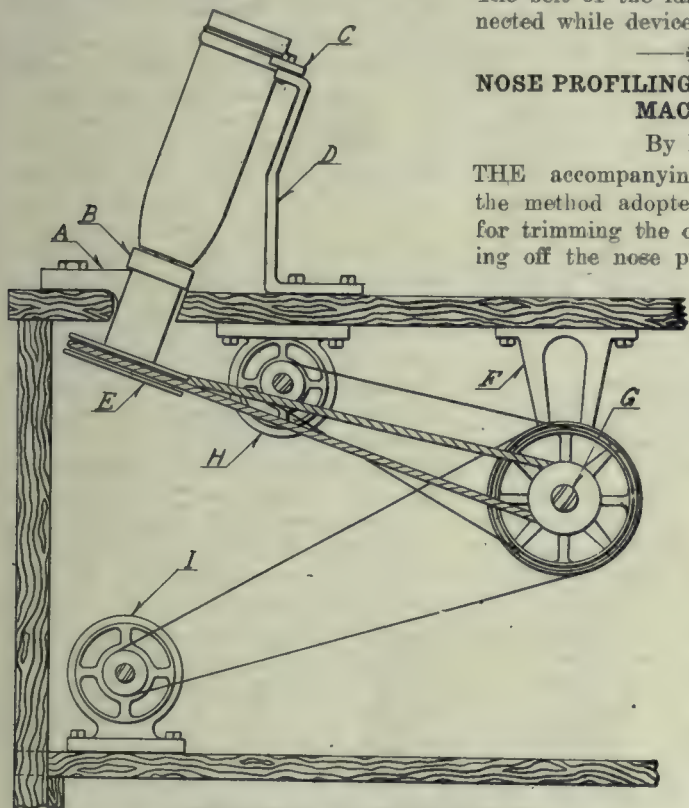

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data  
and Ideas Evolved from Actual Practical Application and Experience

## INTERESTING PAINTING DEVICE

By H. Brown.

AMONG the many operations that are necessary for the production of munitions, that of painting the exterior sur-

INTERESTING PAINTING DEVICE.

face of the shells—while probably of minor importance—requires careful consideration, as the economical and efficient handling of this operation depends largely upon the methods adopted for revolving the shell while the paint is being applied. The device here shown, while similar in some respects to many others, embodies a few special features that may be of interest to readers. The bracket A, that carries the shell support, and revolving shaft, B, is secured to the bench, with the shaft inclined at an angle to allow the copper band to ride on a pair of small rollers, C, that are fastened to the upper portion of the rest, D. By this arrangement the shell is prevented from wobbling, so often seen when the shell is revolved in a vertical position. The shop in which this device was installed, had two sources of power, to provide for any emergency through the failure of one or the other. Continual operation on this device was therefore assured by the placing of two small motors, H and I; one on the under side of

the bench and the other secured to the main cross brace. Both of these were connected to the counter shaft, G, which was supported by the hangers, F, located on the lower side of the bench. The belt of the idle motor was disconnected while device was in operation.

## NOSE PROFILING ON CUTTING-OFF MACHINE

By R. M.

THE accompanying sketch illustrates the method adopted in one shell shop for trimming the open end and roughing off the nose profile. The machine

used for this purpose was an old cutting-off machine, equipped with a front and back tool-slide. The tool-support at the back was specially constructed so that the facing tool A could be set at a slight angle to provide sufficient clearance for the cutting edge. The front tool, B, which shaped the nose contour, was designed to

finish the profile at one operation, the tool being advanced at right angles to the work without any lateral movement; ample rigidity being secured by the width of tool support and the four stud tool rest. By means of the right and left hand screws, the tools were fed to the work, the rear tool cutting a little in advance of the other. The marked success of this arrangement has resulted in a similar machine being constructed which has proved highly satisfactory in operation both as to quality and quantity.

## SIMPLE HEATER FOR LIGHT SOLDERING IRONS

By J. E. Noble

TAKE a strip of tin, make a hole in one end and fold it at the dotted lines as in Fig. 2, to the form shown in Fig. 1. Remove the gas tip from the burner tube and file a hole in the tube, as at A or use the shank from an upright mantle

FIGS. 1 AND 2. SIMPLE HEATER FOR LIGHT SOLDERING IRONS.

burner, force a narrow piece of wood in at C. Punch a small hole in the tin on top, and screw in the hook. This holder will remain on an ordinary gas bracket and can be slipped on or off in a few seconds.

## HOLDING THE TEE-SQUARE STRAIGHT.

J. E. Cooley

WHEN using the tee-square near the edge of the drawing-board, so that part of the head of the square extends beyond the latter, it is quite difficult to hold the square straight and draw the lines true, as the least little pressure of the drawing-pencil against the straight-edge of the square causes it to wiggle

NOSE PROFILING ON CUTTING-OFF MACHINE.

especially at its outer end. Many drawing-boards have two steel straight-edges that are fastened on the left-hand and lower side of the board. If these are sawed in half and an elongated slot

HOLDING THE TEE SQUARE STRAIGHT.

is made in them as seen in the illustration, they can be moved so as to extend beyond the edge of the board, and thus give a firm support or bearing along the entire length of head on the tee-square.

#### OIL-CAN CLIP.

By J. E. C.

A GOOD deal of awkwardness is displayed in the act of picking up an oil-can, because there is no convenient means of taking hold of it properly. Often in attempting to pick one up, it slides away or falls off the machine to the floor. An oil-can should be so ar-

OIL CAN CLIP.

ranged that it can be easily clutched and used on the instant. By this is meant, getting a hold with the index and fore-finger under the spout, and the thumb below the base to squirt the oil. Usually however, on most oil-cans the space between where the spout is screwed to the can, as at A, is so narrow there is no possibility of doing this. If a small clip is made as shown, the oil-can can be picked up without any trouble. The clip is made from sheet-stock inserted over the spout, through the hole, and two sides are folded under the knurled edge as shown. The two projections C and B extend out just far enough to get a sufficient hold with the index and forefinger.

#### PACKINGS FOR SUPERHEATED STEAM

MOST of the packings used in England for steam jointings have been in the past made abroad, and in consequence of the difficulty of obtaining supplies, several British firms have been endeavouring to make in that country packings of equally good quality. The chief difficulty has been to obtain packings which can be used for joints in superheated steam pipes. Several samples have been tested in the apparatus for testing the blowing-out pressure of joints at the National Physical Laboratory, and according to the report of that institution, the makers have been so far successful in producing joint rings varying from 1-32-in. to 1/8-in. in thickness which will stand a pressure of 250 lb. per square inch at a temperature of 1000 deg. Fah. to 1100 deg. Fah., without any signs of breaking down.

#### ELIMINATION OF GERMAN CONTROL OF TUBE WORKS

GERMAN-OWNED shares of the British Mannesmann Tube Co., Ltd., hitherto in the hands of the Public Trustee, have been sold by that individual to a group of British capitalists, including Sir Hugh Bell, A. J. Dorman, Balfour Williamson & Co., and Higginson & Co. The concern has large weldless tube mills at Swansea, and will erect additional tube mills at Newport, Mon.

#### LEATHER VS. SUBSTITUTE BELTING.

By N. G. Near.

I WAS interested in this sentence, in a recent issue of your journal: "Woven belting—is never likely to displace leather in the estimation of a host of engineers." Perhaps the wish is father to that thought, and, per placed in all fields of its use. Yet it is a fact that in several fields the leather belt is practically eliminated.

In the operation of a clay plant, for instance, it has been found that canvas and rubber belts are giving better service for the money than leather belts, besides the workers in those plants find it more difficult to keep the leather belt clean. On main drives, though even in these plants, in the cement field, and elsewhere, the leather belt still seems to have preference, but the fact that the substitute belt is endeavoring to put the leather belt out of business is worthy of note.

Doubtless the main reason for the rise of the substitute belt is cost. Leather is going up, and up. The price of substitute belting, although rising, isn't rising so rapidly, so, even though the

substitute may not last long, it will be used if it will prove as efficient in transmission and if it can be shown that each dollar thus invested will produce more returns than each dollar invested in leather belting. These things are not easy to prove, but, experience seems to be teaching us that in all fields leather is not always the most economic selection.

#### NEW ELECTRO-CHEMICAL INDUSTRY IN NORWAY

A French-American syndicate is about to start a large electro-chemical works in Norway, in the Telemarken district. Some 100,000 h.p. are said to be needed for their purposes, and it was understood that this power would be drawn from the Toke. This, however, turns out not to be the case, the requisite power is to be supplied by the Maar Falls, in Tinn. When the necessary damming and regulation has been done a capacity of 135,000 h.p. is calculated upon. When the Maar Falls are fully exploited an aggregate of 180,000 h.p. may even be anticipated. Two or three power stations can be built, and the locality at Maarvik is well suited for factories, the sea being very deep there and the place well adapted for quay construction.

STAINLESS steel is expected to be the subject of great developments when Sheffield manufacturers are enabled to devote more time to its applications. Where steel is subject to the influence of earth and water this new material will be widely adopted, and in many cases of machine shop equipment its use will be welcome. Machinists' fine tools offer a wide field for its use, steel tapes and scales being also suitable for production in this material, the possibility of making these latter articles having been proven by the successful manufacture of stainless wafer blades for safety razors.

THE Staffordshire pottery manufacturers are, as a body, promoting experiments in order to develop the manufacture of hard porcelain, so as to compete in this product with German and Austrian manufacturers, and they hope thus to build up a new and probably remunerative trade in this material in place of the cheaper sorts of bone china.

**Wrinkle for hot boxes.**—Get a cake of Sapolio and scrape a little of it (fine) into a tin, mix with some water and pour into the bearing while the machine is running. Let it run a few minutes, then give it some oil, and you will find that you have a nicer bearing than you could scrape, and it does not hurt the shaft any.

## IS CHARACTER MORE IMPORTANT THAN ABILITY

By A. L. Haas.

IN actual deed and fact there is more than one kind of ability in a general sense. Besides ability plain, there is also capability and suitability, to say nothing of sensibility to form terms in a broad generalization of men.

Ability is potential, an elastic term which conveys no specific qualification. Capability and suitability, on the other hand, mean fitness to an intended purpose or a destined end.

Half the troubles of management lie in the selection of suitable and capable subordinates. It is difficult, if not impossible, to predicate the possibilities of an intelligent and able man until he is tried out. His qualities in a new environment are unknown. Hence the importance laid upon former experience in the particular field of effort.

It is often considered correct, and acted upon as a general rule, that a specific training tends by its specialization to unfit an individual for other and differing work. For example, few highly trained technical men make first-rate salesmen, they have the knowledge of the goods, but their main interest is in the technique of their craft, not in its commercial application. Few scientific men prove to be practical in their views, the rigidity of their training and its divorce from practical ends tends to unfit them for the rough and tumble of manufacture, trade or commerce. From these aspects the scientific mind is an adjunct, not an end in itself.

The foregoing may be true or not: what is perhaps more pertinent is that few technical or scientific men obtain the opportunity to prove their worth along commercial lines. Certain it is that the possession of brain does not imply business acumen which is itself the product of other factors besides intelligence potential or actual.

Unquestionably one of the greatest assets in life is an instinctive judgment of the worth of other men. This is not so much a natural endowment as a matter of close observation coupled with digestion and assimilation of experience. The man who fails to cultivate in addition to his technical ability that wider study of mankind which is man, is by this reason alone certain to be handicapped at some time in his career. It is as important for a subordinate to be able to gauge and handle his superiors that he may find grace in their sight, as it is for the man in control to correctly esti-

mate worth in an inferior. There is strong probability that a subordinate so endowed will later on have the opportunity of estimation from the upper berth.

The cultivation of a critical faculty with regard to staff and their several values is not less than the importance of a word of praise judiciously bestowed. It implies no slimy attitude on the part of the subordinate any more than a paternal attitude on the part of the employer to render relations of a more intimate character possible with real gain to both parties.

A man of wide experience recently enunciated a dictum he had just discovered in the words "that the best work done was in no instance done for a cash consideration at all." The answer came from the listener promptly. "Were you ever under the misapprehension that it was?"

Many a man has dated a successful career from a sympathetic word of appreciation from his chief: who knows how many original ideas have been lost due to the prejudice which robs a junior of the credit due to him for suggestion or new idea?

There is a type of individual whom it is not safe to praise, another who cannot develop in face of hostility sensed or openly shown. The sensitive, nervous man, intuitive and shrinking in a hostile environment, is not so rare as to be uncommon. He is finely strung, apt to possess a superior mentality and even moderate browbeating will cause him to act stupidly and so sacrifice his worth in an employer's eyes. Many instances of this type must be known to everyone in the business. A safe assumption in the handling of men is that no two can be similarly dealt with. Each man must be individually considered if the best results are desired. Ability is a possession found in combination with many other qualifications and in individuals of most diverse types. Getting the utmost effort out of a crowd of men needs tact and diplomacy of a high order.

It is a sure mistake to assume that resemblance is a guide to selection and to imagine that men for identical work should be to a sealed pattern.

There is ground for belief founded upon experience that the normal individual possessing real character will (opportunity offered and responsibility assumed), put forth greater effort and develop rapidly. Harsh treatment at the start may, and often does, cause him to fail. Judicious handling engendering

the feeling that effort will be noticed and sympathetically regarded, will enable the man to succeed.

There is only one word of advice possible to those finding themselves in a position where the atmosphere is hostile and that is to "get out."

Character and real grit are of greater value than mere brilliance, and strange to relate they are rarer qualities. It is a scathing assertion, but none the less true that brains are cheap and the discovery of character expensive.

A fair mind, judicially inclined, whose honesty of purpose is evident, is of the greatest value in the handling of a labor force. Patience, tact, and discrimination are indispensable factors; it is character that tells in the long run, if only that aspect known as "hanging on" realized as grit to overcome trouble. Ability is common, suitability, and capability not so ordinary a possession, few testimonials specify ability other than in general terms; character is however stressed, this seems to prove the point at issue in this article.

## THE MUNITIONS WORKER

By J. R. Tate.

IT is the dawn of another day, and while all are apparently sleeping, I hear the voice of some happy soul singing in time to the steps of his horse. I listen until both fade away in the distance and all is again quiet. It is the early milk man working that his many customers may have health and strength for the toils of the day to come. And why should he not be happy, in his duty, every step taken, every effort put forth, all to bring health to his fellow workers and their dear families. This man surely has a duty worth while. No wonder he sings, no wonder he is happy, he and his faithful horse completing the duties of their day, that others may live and be happy.

But say, have I a duty? am I doing my duty? The very word seems to put me under bond. What obligations are there on me? here comfortably resting. What duty have I? Yet do I not hear it every hour of the day. Duty calls, your country calls, your King calls! Calls who? They cannot call me; I'm a munitions worker. Am I? Well what am I doing. What have I done. What did I do yesterday. What am I planning to do to-day to justify me in hiding behind the excuse of being a munitions worker? Am I really a munitions worker or a munitions slacker?

Yesterday I saw a large picture of the

man in khaki shaking hands with the munitions worker. I wonder if I am worthy of that hand-shake? Am I, as was written on the picture helping to serve the guns? If not, why am I not in khaki? Oh! but a voice says, "The manufacturers are becoming wealthy, what need is there for your exerting yourself?" "But if," I say, "if that was so, what has that to do with the war? Am I not being well paid to help in this war? Say—that sounds different, being well paid, to help win the war, and right here at home out of range of Kaiser Willie's souvenirs. No manufacturer can do my work. No! nobody but myself can do the small part I am going to do, and if I don't do it, then so much goes undone, so much less is sent on to the front so much short are my countrymen. Short of perhaps one more shell, all because I was a munition slacker. And then I questioned my having a duty. Why! it is so plain! I am an important wheel in this great machine. And I see the long chain of stops on account of my stopping, and at the end of it I see the last shell fired. If they only had another one! but I rested I did not concern myself. And the shell was not there, and the enemy came on and on and my chums and my friends fought bravely, but they had not that one more shell. The one I could have made. Tomorrow I will read their names in the long list, and I will be free from any blame, free from suspicion, free from the brand of a slacker. Yet not free from the knowledge of myself. But stop this is developing into a nightmare.

The alarm clock rings. It startles me, yet did I ever welcome it so? It is my reveille, time to get up, time to start, time to buckle up for the day's work, time to strike another blow to crush this military monster. Then no more dreaming, no more shirking, no more excuses, but let me up that I may perhaps not sing while on the way to my post, but approach with an eager step, to grasp the levers with a determined grip, that I may hear the rumble of the great machines, echoes as it were from the front, that I may feel the thrills of imagination that I also am in the fight, into it to win. And then at the end of this day, I will have no ill-concern, but will know that I, the munition worker, have done my duty, have done my bit, have also helped to serve the guns.

#### MACHINISTS' INSTRUCTION COURSE—IV.

WHILE many shops have special tools and appliances for their particular work, yet there are general tools common to every workshop for use on the drilling machine, such as angle plates, V-blocks,

vises, screw jacks, parallel pieces, etc. When the work reaches the drill hand it is usually marked off for the hole or holes. A circle equal to the diameter of the hole required is marked on the job, with a centre punch mark in the centre of the circle and small punch marks in

FIG. 17.

the circumference of the circle. The first thing to do is to enlarge the centre punch mark to give the drill a start, as without a fairly large punch mark it is difficult to drill to the marked off lines. A piece of an old round file makes a good centre punch, but be sure to get it softened first and hardened only at the business end. Never strike the end of any hardened tool with a hammer—many mechanics have lost an eye through carelessness in

FIG. 18.

this way. Don't try to make a deep centre punch mark in a light cast iron job—you will most likely break it if you do. If the work has a smooth surface and the lines of the circle are clearly visible, drill to the lines rather than the punch marks.

#### Drilling Large Holes

In drilling large holes, put a small drill through first, called a lead hole (see Fig. 17); this allows the pressure of the drill to come direct on the cutting edges instead of on a thick point. An exception to this rule would be the drilling of a concave surface. In this case the steadying influence of the drill point would be a distinct advantage, and the small drill could be put in after the large drill was below the concave surface if the depth of the hole made it worth while. A very simple and effective method of making an extension drill useful

for making lead holes is to take a piece of cold rolled steel long enough to grip in the chuck, drill a hole in the end the size of the drill we wish to extend, then file or shape at the end of the drilled hole a slot to fit a flat surface that has been filed on the end of the drill, Fig. 18.

The next important step is to prevent the job running round with the drill. Apprentices as a rule are careless in this respect; they often try to hold the job with their hands, thinking it too much trouble to hunt for bolts, etc., to make the job secure. This is the cause of broken drills, and often of more serious accidents. You will have to learn to use your own judgment in this respect, as every job must be handled on its own merits, but it is better to err on the safe side.

Some jobs, such as rough holes in a

FIG. 19.

flat bar, need not be bolted down. Put the job on a piece of wood of even thickness, hard wood preferred. Then fix a bolt with a piece of pipe on it in one of the slots of the table, as in Fig. 19, which will form a good stop for all jobs of that description. For jobs that need to be bolted down, the common U-clamp is the most convenient. This consists simply of a piece of square iron bent to leave a slot in which the bolt fits easily, Fig. 20. Sometimes in places where the nut would be in the way, it is convenient to have a set in it.

In bolting work of any description to the drill table, see that there is room under your job for the drill to go clear through without making a hole in the table. It may be necessary to put

FIG. 20.

parallel pieces or other packing under the job. Have your bolt or bolts as near the job as possible, and your packing piece as far away as is convenient, and your packing pieces the same height.

Some wrong ways of bolting a piece of work down are shown in Fig. 21, also the right way.

In drilling holes in thin sheet iron, bolt the piece or pieces solidly down on a piece of scrap iron, and drill into the scrap iron until the drill is cutting the full size into the scrap. If you simply place it over a hole in the table, the hole

will look as if it had been done with a dum-dum bullet.

#### Drawing the Hole

Very often when you start to drill a hole, the drill will not cut true to the circle marked off, but will cut to one side. In this case cut a light groove with a round-nosed chisel on the side toward which the drill is to be drawn, or on the wide side. Don't wait until your drill is cutting nearly the full size before you draw it over, or you may not be able to draw it over. Draw it over as soon as you detect the error, then cut out your chisel marks with the drill and repeat

the operation until your drill is cutting true to the lines.

To drill through the centre of round bars, bolt a vee block to the table, or if

the bar is a long one a pair of vees. Set your drill exactly vertical to the centre of the vee with the centre punch mark for the hole directly under the point of the drill. For repetition work the vee block and clamp, illustrated in Fig. 22, will be found simple, accurate, and quick after it is once set.

In repair work it is often found necessary to drill a hole through a sleeve, collar, or double eye to suit an existing hole in a round bar where the hole, through someone's bad workmanship, does not go through the centre of the bar. In this case place the round bar in the vee block, and put the drill through the hole, Fig. 23, bolting the vee block down and fastening the table in such a position that the drill is free to move up and down in the hole. Now replace the bar with the collar to be drilled, leaving the vee block in the same place, and with care the holes in the collar will coincide with the holes in the bar. If the hole is to be drilled in the same way, and for many other jobs which it would be difficult to mark off, this method can be used to advantage. In drilling holes in round bars for slots it makes the best job to drill half-way

through the bar from each side, provided the holes are properly marked off.

#### Useful Items of Equipment

A pair of angle plates are among the most useful tools for fastening work to the drill, and if they are both alike and properly designed, they form quite a number of very useful combinations. Bolted face to face, they can be made to form any angle; standing on end they form vees for drilling round stock endways; side by side they form parallels for drilling pipes, etc. (see Fig. 24):

An overhanging arm as in Fig. 25, is often useful for drilling wheels and pulleys that are too large to go on the table. In drilling, tapping and clearance holes, as in bearings and caps for same, drill the clearance holes in the cap first, then use the cap as a guide or jig for the tapping hole, putting the clearance drill into the tapping hole until it begins to cut full size, which will prevent the tap raising a burr; then change the drill to tapping size and drill the tapping holes.

In drilling circular rows of holes in large rollers or other large round work,

such as boiler tubes, etc., fix up some kind of a rig, such as four small rollers or pulleys fastened to a wooden frame made of scantlings, or four wooden wedges nailed to a board, or some other device that circumstances will permit,

and your ingenuity devise. The object to attain is to fix up your job in such a way that it can be turned round, and have each part to be drilled come under the drill in turn without resetting.

In some cases where two holes are to be drilled in line with each other at opposite sides of a casting, it is impossible to drill right through at one setting, as also with a long hole through a bar or shaft. In these cases a centre is fixed either in a casting bolted to the base of the machine, or else fitted to the hole in the centre of the table. The centre punch mark for one hole is placed on the fixed centre, and the other is brought directly under the drill. Great care must be taken to have the fixed centre directly in line under the centre of the drill spindle. Drill one end, then turn the job over and repeat the operation. When turning the job end for end, if the hole drilled is too large to sit on the

conical part of the centre, it must be temporarily bushed with a concentric bush—that is, one that is turned and bored true. Fasten the job securely before you start to drill, the method of doing this depending entirely upon the nature of the job and the tools available, as all that can be done here is to give general principles and instructions.

# Evolving Standard Cutting Tools After a Definite Plan--III.

## "Herbert's Monthly Review"

This series of articles dealing with the practical side of the subject of cutting tools may be said to be supplemental to what appeared in our issues of July 20 and 27; cutting tools from the theoretical and analytical view point were then discussed. As efficiency in the machine shop depends largely on the character of the tools used, it is believed to easily worth while for those concerned to not only sift this tool question to its fundamentals, but for each individual shop to establish a standard tool scheme to suit its own special conditions.

**TOOL No. 12**—to continue the series description, is a somewhat unusual product, and it is only possible to make such a tool commercially by means of the Lumsden curved face attachment. It is a double side tool, so shaped that it can be used for finish facing on both sides of the tool. To do this, a hollow curve is ground in the top face parallel to the sides of the tool. This tool is very useful for facing down the sides of cams on a solid cam shaft, saving the use of an extra tool. In the same way, thrust bearings on propeller shafts, collars and flanges, bushes on mandrels to be faced on both ends, are all suitable work for this tool. It is well adapted, too, for facing bosses, inside or outside castings on boring machines. As this tool wears mostly on the sides, it is

preferably made from steel of a section having the depth one and a half times the width.

**Grinding Instructions.**—First grind sides 1 and 2, giving 6 degrees of clearance to each. Next grind the end at right angles to the two sides, also giving 6 degrees of clearance. The final operation is the grinding of the hollow curved top face, using the attachment. Set the tool parallel to the slide, which should be tilted to about 15 degrees "right" to give the curvature which satisfies most conditions. Continue the grinding till a cutting edge is obtained on both sides. If it appears that an edge will be given on one side sooner than the other, adjust the grinding wheel sideways. If the tool width is greater than, say, 1 in. and the 15 degrees setting of the slide gives too

keen a rake, the rake can be decreased by tilting the slide a little more, say, to A.20 right.

**Tool No. 13** is used for undercutting tee slots; for turning the recesses at the end of internal screw threads, and for planing square grooves in the sides of castings. In order to present face 4 to

the grinding wheel, it is necessary to hold this tool for the fourth operation in the adapter furnished with the machine. The tool shank is, therefore, set at right angles to the toolholder axis. Care should be taken to see that the tool shank is parallel to the machined faces of the adapter, other the angles given on the chart will not be reproduced on the tool. The section of steel from which this tool should be made will depend somewhat on circumstances. For a planing tool a section of 1½ to 1 is suitable; for recessing inside holes it may be necessary, where the hole is small, to forge the end of the tool to a round section, with a small projection for the cutting nose.

**Grinding Instructions.**—For opera-

tions 1 and 2 grip the tool in the machine toolholder in the usual way with the tool base on the holder base; also for operation 3 if the top face is ground flat, which it would be for cutting cast iron. For operation 4 grip the tool in the adapter, as mentioned above, and the adapter shank in the machine toolholder. Set the tool in the adapter with its shank horizontal and pointing towards the wheel; the top face should be downwards. When set to the angles given in the chart, face 4 will come in contact with the front of the wheel, while the shank will lie along and nearly

touching the side of the wheel. For grinding a curved top face the operation is very similar to that on tool No. 12—that is, the tool shank is set parallel to the slide.

**Tool No. 14** is a combined turning and facing tool very much in demand for

No 14-Combined Turning and Facing			
SETTINGS		TOOL

machining chuck work on capstan and combination turret lathes. It economizes tool space on these machines by eliminating the extra side tool. It also facilitates output, saving the change over from one tool to another when changing from turning to facing or vice versa. For either turning or facing separately, it is not, of course, as efficient as a standard tool designed solely for the one operation; but where the two operations are carried out on the one piece, it becomes efficient through the time it is possible to save.

**Grinding Instructions.**—These are fairly straight forward. The three finished faces are ground in the order specified; top face 3 being given a flat top face for cutting cast iron and a hollow curved top face for cutting steel. When grinding a curved top face, the curvature should come at 45 degrees to the

tool shank; this leaves the point between faces 1 and 2 standing above the remainder of both cutting edges; therefore, the curvature given to the tool should not be too small or the point will be too delicate. Care should be taken on this score.

**Tools No. 15 and 16** are standard side facing tools. They are an improvement on the generally accepted form of side tool, which is forged with the cutting edge offset from the shank. The Lumsden standard side tool needs no forging; the cutting edge is ground at 5 degrees to the side of the tool, this necessitating the tool being set at a similar angle in the tool rest, in order to bring the cutting edge in correct relation to the work. These tools are much more efficient than the usual type of side tool, which is costly to forge and weak when made. It is also soon rendered useless by regrinding. The Lumsden tool is stronger, and

has a considerably longer life than the offset tool. In case the 5 degrees inclination of the tool in the tool rest cannot be allowed, then a tool forged to a similar shape to No. 13 with the cutting edge ground parallel to the side of the tool is better than the offset tool. It is not practicable to grind this tool with a hollow curved top face, as it would then become similar to tool No. 12. The depth of the section of steel from which these tools are made should be twice the width.

**Grinding Instructions.**—There are no points worthy of special mention in the grinding of these tools, provided the directions given on the chart are followed. If, however, the tool be used for facing down the ends of work, it will be necessary either to remove the corner behind face 2 or to use the following settings for operation 2, making the angle 1 degree less than the angle of a standard 60 degrees centre:

Turntable.	Trunnion.	Toolholder.
No. 15. 50 black. 6 up. A zero.		
No. 16. 50 black. 6 down C zero.		

If a tool like No. 13 is used, the settings for the three operations will be for tool No. 15, as follows:—

Op. 1	Op. 2	Op. 3	Turntable.	Trunnion.	Toolholder.
Zero.	75 black.	Zero.	Zero.	6 up.	C. 6. Right.
			Zero.	Zero.	A. Zero.
					D. 20. Left.

FIG. 3. CHART SHOWING VARIATIONS OF TOOL FOR DIFFERENT CLASSES OF WORK.

rection of the feed, thus allowing a slight amount of spring, which does away with chatter. Chatter is caused by weakness or slackness in slides or bearings. The trailing tool is a much easier tool to make, and one equally as satisfactory in use as the popular "swan-neck" tool, so beloved of planer hands. It is included in the Lumsden Chart, merely because the conditions calling for

should be decreased. The settings for operation 3 are:—

	Turntable.	Trunnion.	Toolholder.
No. 17.	8 fore.	Zero.	D. 8. Left.
No. 18.	8 fore.	Zero.	D. 8. Right.

**Tool No. 19** is a knife tool for turning bar stock in turret lathes, using steadies at the back of the work. It is an extremely simple tool to make; care must be exercised, however, in grinding the side and top faces to see that no more metal is removed than will give a cutting edge. This leaves the cutting edge practically level with the top of the tool. The section of steel from which this tool is made must be ascertained from the tool-boxes of the machines on which it will be used.

**Grinding Instructions.**—The grinding of the end and side (faces 1 and 2) present no difficulties whatever. When starting on the top face, stop the oscillation of the wheel and cut into the tool for a length equal to about twice the maximum depth of cut allowed for in the tool-box of the machine. When the wheel has obtained a good hold on the tool, run the wheel back a little and start the oscillation again, regulating the amount so that the maximum stroke is obtained without the wheel leaving the work. Then continue the grinding till an edge is given. The 35 degrees of rake given to the top face has been proved by long experience to give the best results; this angle can, therefore, be standardized, no variations being allowed.

**Tool No. 20** is a standard parting tool, and illustrates in a marked manner the importance of keeping clearances down to the minimum. The Chart shows that the two flanks should be ground at 1 degree with the side of the tool, giving 2 degrees of clearance. Even these small angles weaken the tool considerably, and broken parting tools are of frequent occurrence. They can be safely and advantageously decreased to half a degree and 1 degree respectively, provided the base of the tool is surfaced before grinding. This surface can be done in the curved face attachment, setting the tool and slide horizontal and parallel to the face of the wheel. The settings for this operation are:—

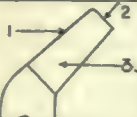

90 Right.	90 Back.	Zero.	B. Zero.
Attachment	Turntable	Trunnion	Toolholder

The tool can then be passed across the face of the wheel by means of the lever at the end of the slide. It is strongly recommended that the bases of parting tools should be so surfaced, as the tools can then be safely made from a narrower section of steel. A section of two to one is satisfactory. The end should be forged down to half the tool width for a length equal to a little over twice the width, preferably leaving one side of the nose level with the side of the tool. The top face can be ground with a hollow curved top face, but this

is hardly to be recommended, as it tends to cause "grab." It is better to leave the face flat and with no rake at all.

**Grinding Instructions.**—First touch up the end of the tool, giving 6 degrees of clearance. Then grind the flank that is level with the side of the tool, only just cleaning it up. The other side can

its use are allowed to exist; not because it has any claims of efficiency. It is not practicable to grind these tools with hollow curved top faces. As the tool must have a certain amount of spring it should be made from a section of steel with depth twice the width, and the nose should be forged down till the width across the end is a little more than half the width of the shank.

**Grinding Instructions.**—These tools should be forged so that face 1 is approximately at 45 degrees with the side of the tool. In operation 1 the angle given for the turntable setting is based on this assumption; if, however, the forging will not allow this angle to be given to the tool without weakening it excessively, the grinding should follow

the forging, the clearance angles given by the trunnion and toolholder settings not being affected by any variation from, say, 40 to 50 degrees. Forging should be done within those limits. Only face 1 is ground with clearance. Eighteen degrees side and front cutting angle combined give approximately 25 degrees rake to the cutting edge. If the tool is intended for cutting cast iron, this rake

then be ground till the nose is of the required width, say, a little less than half of the width of the shank. The top face should be just cleaned up.

**Tool No. 21** is included because, in spite of the strides made in thread milling and chasing by means of specially prepared chasers, there are still numbers of screw threads cut in the lathe. The angles given on the Chart make this tool suitable for standard Whitworth threads 10 per inch and finer; in other words, face 2 has more clearance than face 3 to accommodate the lead angle of the thread. For coarser threads the clearance on face 2 should be increased by means of the toolholder setting; this will depend on the diameter of the work. The corner of the two front faces should approximately follow the lead angle of the thread. Any increase in lead angle should be added to the setting C.10 right in operation 2, while the same increase should be given to the toolholder setting

Nº21-Screw Cutting.				
TOOL	OPERATION	SETTINGS		
		TURN-TABLE	TRUNNION	TOOL-HOLDER
	1.	ZERO	ZERO	A Zero
	2	27 1/2 Back	6 Down	C.10 Right
	3	27 1/2 Back	6 Up	A Zero
	4	15 Fore	ZERO	D Zero

in operation 3, making A. Zero into A. degrees left.

**Grinding Instructions.**—First grind face 1, making the tool nose about 5/16 in. to 3/8 in. thick; the tool nose can be forged if desired. The two cutting edges are then ground, utilizing the toolholder settings to give the requisite clearances. The top face should be given a rake of 15 degrees by means of the turntable setting if the work is steel. If cast iron, the rake can be 10 degrees.

**Tool No. 22** is a standard tool for cutting brass and any grade of bronze that partakes of the brittle nature of brass. For bronzes that cut more like steel, the

standard tool for steel will be better, though it will usually be desirable to make the rake a little less keen, say, 10 to 15 degrees. The standard brass cutting tool is one that will be most often used in brass finishing and capstan lathes. The section of steel used should, therefore, be ascertained from the toolholders of the machines on which the tools will be used.

Grinding Instructions.—These call for practically no comment, as all the operations are straightforward. When grinding the angled faces 2 and 3, care should be exercised to make them about the same length, leaving about 1/16 in. to 1/8 in. flat on face 1.

N <sup>o</sup> 22—Brass Cutting.

	1.	90 Back	5 Down	C6 Right
	2.	30 Back	5 Down	C6 Right
	3.	30 Back	6 Up	A6 Left
	4.	ZERO	ZERO	D Zero

Tool No. 23 is a slotting tool. The type of tool used on slotting machines differs from all others in that the top face of the tool is the end. As slotting tools usually have a large amount of overhang, some provision must be made in the clearance of face 4 for a certain amount of spring. This face, therefore, according to the Chart, is given 10 degrees of clearance through the turntable setting. The end or top face is given 10 degrees of rake. The tool shown in the Chart is suitable for a slab finishing cut or for cutting keyways. For roughing cuts, face 4 should be ground to a diamond shape and the corners rounded by hand. This makes two further settings necessary over and above the four operations indicated, though if the forging is correctly done operations 2 and 3 may

N <sup>o</sup> 23—Slotting.

be omitted. The two extra settings will be:

Turntable. Trunnion. Toolholder.  
Op. 5. 3 fore. Zero. D. 35. Right.  
Op. 6. 3 fore. Zero. D. 35. Left.

If the tool is required for slotting keyways, then the width of face 4 must be carefully regulated when grinding

faces 2 and 3 to the desired width. Care must be also taken not to grind so much off face 4, that the tool will not slot to the full depth of the keyway.

Grinding Instructions.—Contrary to

the usual rule of grinding the profile of the cutting edge first, in this case it is preferable to grind the top face or end of the tool first, next the sides, and finally the profile. This tool is necessarily forged, and if the portion between the nose and the shank proper is at all slender in relation to its length, some means of securely gripping it in the toolholder must be arranged, otherwise the angles will not be accurately produced through spring of the tool.

Tools No. 24 and 25 are included in the Lumsden Chart to show that radius tools can be very easily and quickly shaped. If the radius or radii required are smaller than half the width of the shank, there is no need to forge them.

N <sup>o</sup> 25—Double Radius.				
TOOL	OPERATION	TURN-TABLE	TRUNNION	TOOL-HOLDER

	2.	ZERO	6 Down	C6 Right
	3.	ZERO	6 Up	A6 Left
	4.	Set for required Radius & Work Turntable between Zero & 90 in conjunction with settings 1 & 2.		
	5.	In conjunction with 1 & 3		

The radius gauge furnished with Lumsden grinders is not a very rigid device and close accuracy cannot be obtained. If, therefore, the tools are required for precision work, the radius ground should be checked by means of a plate gauge. If this shows the radius ground to be too small, adjust the tool forward a little in the toolholder; if too large, adjust it back a little to suit.

Grinding Instructions.—Fix the tool in the toolholder so that it projects over the centre of the turntable a little more than the desired radius. Next offset the tool, by means of the endwise adjustment of the trunnion bearings, an amount equal to the distance between the centre of the tool shank and the centre of the radius to be ground—this can be measured approximately on the top of the tool. Set the trunnion and the toolholder to give 6 degrees of clearance

on both front and side of tool. Clean up the end of the tool and set the stop, which limits the forward movement of the wheel. Run the wheel back, swing the turntable round to zero, and grind the side of the tool, bringing the wheel up to the stop again. Run the wheel back a little, then swing the turntable from zero to 90 degrees, feeding the wheel forward, using but slight oscillation, until the stop is reached. The desired radius should be then merged into the front and side imperceptibly.

**ONTARIO'S NICKEL PRODUCTION**  
PRODUCTION of nickel and copper ore in Ontario during the past ten years, shown below, has yielded about three per cent. nickel, and over one and one-half per cent. copper. This is exceptionally high-grade ore. Under present conditions it might be treated profitably for its copper content alone.

In addition to nickel and copper the Sudbury ores contain small quantities of the precious metals, gold, silver, platinum and palladium. The actual quantities are not reported. According to the International Nickel Company there was no production of these metals from Canadian ores at their works in 1912 and 1914.

	Tons Ore Raised.	Tons Nickel in Matte.	Tons Copper in Matte.
1906	343,814	10,776	5,260
1907	351,916	10,602	7,003
1908	409,551	9,563	7,501
1909	451,892	13,141	7,873
1910	652,392	18,636	9,630
1911	612,511	17,049	8,966
1912	737,456	22,421	11,116
1913	784,697	24,838	12,938
1914	1,000,364	22,759	14,448
1915	1,325,974	34,039	91,608
Total	6,070,766	182,824	104,343

Previous to 1906, 2,700,000 tons of ore were raised, 2,100,000 tons were smelted of which 48,000 tons were nickel in matte and 36,000 tons were copper in matte.

MANUFACTURERS of both lathes and grinders agree that, as a rule, shafts should be rough turned to within .015 in. or .020 in. above finished size, rather than within .010 in. or less. This is done for several reasons. The lathe operator can use a coarser feed, thereby cutting down his lathe time. It allows him a greater range in size and eliminates the possibility of the grinding wheel failing to take out the tool marks. Also a coarser feed makes an easier operation for the grinder, as the coarser the feed the easier it is on the wheel. In small diameter shafts, which are liable to spring when roughing in the lathe, it is evident that sufficient metal should be left that the grinding wheel will be sure to true up the shaft.—Lodge & Shipley Manual.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## IMPROVED CENTRIFUGAL BOILER FEED PUMP

THE development of the steam turbine and the high efficiency multi-stage centrifugal pump have gone hand in hand, but up to the present, it has not been entirely practicable to reconcile the speeds of the two machines so that each would work at its best efficiency. It has been necessary, heretofore, either to reduce the speed of the turbine and sacrifice much of its efficiency, or else speed up the pump with similar results. To overcome this difficulty, the Cameron Pump Works, 11 Broadway, New York, have designed and built a multi-stage centrifugal pump, known as the "BT" type.

Fig. 1 shows the construction of one of these three-stage pumps. The high speed feature—the pump can operate with a steam turbine driven speed of 3,100 r.p.m.—is a virtue of impeller design. With the ordinary impeller the diameter cannot be reduced sufficiently to get high speed without sacrificing

form its function without excessive loss. Small external diameter and adequate vane length are obtained in this pump

the velocity is generated that is finally converted into useful pressure by means of the external diffusion vane. Addi-

FIG. 2. SHOWING PUMP COUPLED TO STEAM TURBINE.

by bringing the vanes well down into the impeller hub, at the same time so

tional advantages in the small impeller are light weight and low fibre stresses in the material.

The casing is divided along the horizontal outer line, and both the suction and discharge connections are in the lower half of the casing. The upper half is readily removable, giving full access to the revolving element. There are suitable openings for draining the pump and for displacing the air when starting. Inlet and outlet nozzles can be arranged either on the same or opposite sides, an important advantage where pumps are installed in limited space.

The shaft is made of high grade forged steel accurately machined and ground, and wherever it comes in contact with the fluid being pumped, it is thoroughly protected by bronze sleeves, which prevent the stuffing box packing from scoring the surface of the shaft. Each impeller is cast in one piece and is of the enclosed type. Surrounding each impeller hub is a pair of rings—one stationary, attached to the casing, and one revolving, attached to the impeller. By the use of double rings instead of a single ring, it is possible to restore the initial tightness of the joint between the low and high pressure sides of each stage without any fitting, whereas a new single ring would have to be of special diameter, and then fitted to the impeller hub, or the casing, to make a tight joint.

The diffusion ring surrounds the impeller at its periphery, although it is not

FIG. 1. SHOWING CONSTRUCTIONAL FEATURES OF PUMP.

vane length, and consequently, efficiency, for a certain vane length is very necessary in order that the impeller per-

turning them that the incoming water is guided smoothly and with little loss into the outer portion of the vane where

in contact with it. It contains a series of openings, which receive the water from the impellers at high velocity and by means of gradually increasing area toward the periphery, reduce the velocity into pressure and enable it to advance to the entrance of the next impeller with much less loss of energy than would be the case if the high velocity of ejection were maintained.

To take care of thrust, which manifests itself in all multi-stage units, this pump is equipped with a simple internal hydraulic balancing device. This device consists of a revolving disc attached to the shaft at the inboard or high pressure end. Opposite this disc is a stationary drum of the same diameter. Water at high pressure connects with the space between the disc and the drum, causing the disc to react against the opposing thrust, neutralizing it and holding the rotor in proper relation to the casing. The slight leakage involved in this process is piped back to the suction.

On this pump there are two ring-oiled bearings, self-aligning, one located on each side of the casing. The bearing bodies are horizontally split, with removable caps, and the bushings are also split and lined with high-grade bearing metal. Bushings and bearing bodies have a spherical fit, automatically maintaining the alignment of the shaft. The bearings are of ample proportions to prevent heating, and the oil chamber is of liberal capacity. The bearings are supported by strongly ribbed brackets, cast integral with the lower casing, thus counteracting any possible tendency towards even slight vibration. These brackets are located sufficiently distant from the stuffing boxes to permit of adjustment of the glands. Felt washers are provided to prevent oil escaping from the bearings.

The stuffing boxes are deep and are provided with water seals, consisting of a lantern gland in each box connected to the water from the discharge side of the pump through a concealed passage, and so arranged that it can be readily cleaned. The stuffing box gland is fitted with swing bolts to give quick and easy access to the stuffing box.

When the pump is direct-connected, it is supplied with a shaft coupling of the flexible type to compensate for slight variation in alignment. The bed plate under the pump is of one piece box construction heavy enough to give a rigid support, and with cross ribs to prevent distortion. Fig. 2 shows this pump entirely assembled.

Galt, Ont.—A member of a firm organized in Toronto for the manufacture of railroad supplies has been in Galt recently looking over local conditions with a view to locating the plant.

## A SPRINKLER STOKER WITH ROTARY DISTRIBUTOR

A MECHANICAL stoker of the sprinkler type, combining novel features tending toward simplicity and reliability of working, has been placed on the market by the Galt Foundry Co., Galt, Ont. The apparatus is known as the Galt Sprinkler Stoker, and is specially designed to feed and spread the coal continuously over the grates, as opposed to the intermittent methods of hand firing, or to the practice of dividing the furnace chamber into zones — coking and ash belts.

The stoker is entirely self-contained, being assembled on a frame casting which hangs upon the boiler front in place of the regular fire-door, the feeding mechanism covering only a narrow space across the upper part of the fire-door opening. A fire-door is fitted in the supporting frame, giving access to the furnace at all times.

Situated above the feeding mechanism is a feed hopper having a capacity of about 300 lbs. of fuel, which can be conveniently detached when required for access to the flues and tubes. The fuel in the hopper is drawn down and moved across the bed plate of the stoker by the reciprocating motion of the feed plate produced by means of the rocker arms shown in sectional illustration, these arms in turn being actuated by a rocker arm connected to an eccentric on the main shaft, the rate of feed being controlled by a hand wheel.

The spreading of the fuel over the grate surface is accomplished by means of the rotary stoker or feeding device, which is operated independently of the feed regulating device, and at a constant

it falls on a curved plate or tray where it is caught by the revolving blades and thrown into the furnace. The revolving blades have an alternate helical face

FIRE DOOR GIVES FREE ACCESS TO FIRE AT ALL TIMES.

which spreads the fuel successively to either side so that even distribution of the fuel is accomplished.

These distributor blades are heavy steel castings freely suspended, so that, when operating, they are held in position by centrifugal force, and thus may yield if an unusual obstruction is encountered.

All rotating shafts on the stoker are carried in removable bronze bushed bearings. The distributor and eccentric shafts are driven by heavy roller chain of ample size running on machine cut sprockets. The self-contained fire-door is of ample proportions for hand-firing in case of emergency, or for regular banking of the fires, which can be done without interruption to the working of the mechanism.

SECTIONAL VIEW OF FURNACE SHOWING FEEDING AND DISTRIBUTION OF FUEL.

speed which can be adjusted for different depths of grates. As the fuel is forced over the edge of the bed plate

now works well. he motor would not stand the sudden jerks sent to it by the wide belt.

A saw belted direct from a 7 horse-power motor would not rip anything. A 10 horse-power motor was put in, but the machine still refused to work. It was a large self-feed saw with pulley on arbor for an 8-inch belt. A 7-inch belt was being used. To save the motor, the 7-inch belt was taken off and replaced by a 4-inch one. The saw

### ENEMY PATENTS

IN view of the frequent comment regarding the ease desirability of annexing enemy patents under present conditions, it may perhaps be not inappropriate to sound a note or warning regarding the popular supposition that valuable ideas are lying waiting for our manufacturers to pick them up free of cost, etc. Incidents are coming to light every day which show that the germs of dishonesty and trickery were long ago prominent in the make-up of the Teutonic people, and it is this tendency on the part of our enemies to "put it over" the other fellow that constitutes a serious feature in handling anything savoring of Germanism.

The experience of an English firm was brought to light during the hearing recently of their application for licenses to use three German patents in connection with the manufacture of ammonia from hydrogen and nitrogen by the synthetic process. Patent law universally calls for the specification to be drawn up clearly and concisely so that any party skilled in the art or science of the subject may be enabled to carry out and put into practice the idea or ideas which constitute the invention, yet it has been a recognized German custom for patentees to so describe their inventions that while they would be accepted by patent office authorities, there would be some slight unseen deviation or omission which prevented their being easily put into practice.

The patents referred to were owned by the Badische Anilin Co., and the English applicants stated that in addition to the specifications being involved and non-intelligible, the actual work of endeavoring to put the process on a commercially profitable basis had taken fifteen months of experiment and research, at a cost of \$7,500 before a satisfactory result could be obtained. It is not surprising, therefore, that the applicants suggested the royalty be purely nominal, and the granting of the license meantime, with a decision at a later date on the question of royalty would seem to indicate, at least a common-sense if not a sympathetic attitude on the part of the authorities.

While we have not been aware of any great activity by Canadian firms in investigating enemy patents, any such efforts are to be condemned, as, even if no immediate find of value results, the increased breath of view which accrues from such comparisons is bound to be reflected in later developments, while the strengthening of faith in ones own product is not the least the result of what might otherwise seem to be a fruitless investigation.

### A PROMISING DEVELOPMENT

THE development of trade between the various colonies of the Empire should continue to increase after the war at a gratifying rate because of the similarity of product in demand in the various Dominions as distinct from the United Kingdom. Electrical material was one of the lines in which Britain showed to disadvantage in foreign and colonial trade. The disadvantage was the result of superior quality, conservative design, and occasional lack of salesmanship. The first of these is admirable withal, and worthy of all due emulation, but the necessity for giving people what they want, eliminates any argument in favor of unsuitable construction, while if the time and terms of the attempted sale are ill-judged, the inability to extend business is easily understood.

In the matter of electrical equipment manufacture, the Dominion is well favored, by circumstances in the past and conditions in the future. Such a simple matter as the type of lamp socket used in overseas trade is one slight instance of favorable circumstance. With the exception of the United Kingdom, the use of screw sockets is practically universal all over the world. Some British firms in the past have offered the bayonet type of socket and lost the business rather than make both types. Makers in this country are in the more fortunate position of finding their own article and the foreigner's almost identical.

Home Office requirements in Britain have evolved super-excellent apparatus which is not in such demand abroad because of the absence of similar restrictions, which, however desirable from the standpoint of safety and reliability, cannot compete commercially with the ordinary grades of material in common use. The similarity in conditions and requirements between our own country here and such new markets as are offered by Russia, Africa, Australia, etc., is bound to be a strong help in obtaining a fair portion of former enemy trade in electrical lines.

### STEEL SHORTAGE BECOMING MORE ACUTE

IT is now obvious that the iron and steel market has entered upon another period of activity, and its effect on business will be widespread. Conditions are, of course, abnormal and the unexpected may happen, but even admitting this, there is little or no relief in sight to what is fast approaching a serious situation. A point was reached some time ago previous to last June, where consumers would not place contracts for steel unless they were obliged to do so, and consequently held off, hoping for a return to more normal conditions and lower prices. The trend of events since then has upset their calculations, and many have been forced into the market, while others will no doubt hold off indefinitely. It is with regard to the latter that the most serious aspect of the situation presents itself, for, principally on this account buildings are being held up, public works restricted and many developments postponed until steel can be obtained in a reasonable time and at a lower price.

It will thus be observed that the present unprecedented prosperity in the steel trade has its disadvantages as well as its benefits, the latter affecting the mills only. It is impossible to enumerate the finished products that have advanced even during the past twelve months, as so many lines have been affected, and few more so than machinery. All kinds of machine tools and heavier equipment are much higher than before the war, while supplies have also been seriously affected. Boiler plates were never so scarce, while steel rails are practically unobtainable inside of twelve months. The mills, notwithstanding their increased facilities, are unable to cope with the demand for steel, and their unfilled tonnages are steadily getting heavier, with the result that higher prices are inevitable.

## INDUSTRIAL NOTABILITIES

**W**ILLIAM H. MARSH, Secretary and Manager and a Director of Standard Underground Cable Co., was born in Baltie, Ohio, Jan. 10, 1882, the son of Julius P. and Catherine Marsh. Following an education at Public Schools, he studied at National Normal University, Lebanon, Ohio; Polytechnic Institute, and Pratt Institute, Brooklyn, N.Y. Commencing his business career as Cable Installation Foreman with the Standard Underground Cable Co., Pittsburgh, in 1900, he became Superintendent of Construction and Cable Engineer for that company in New York, 1903, and was appointed to his present position 1911.

WILLIAM H. MARSH.

Mr. Marsh was responsible for the successful installation of the power cables in the tunnels of the Pennsylvania Railroad from New Jersey to Long Island, and has occupied a prominent part in the work of installing underground conduit and electric cable systems in many of the larger cities in Canada and the United States, having had charge of such work in Toronto when Niagara power was first used there. He also originated the use of compressed air for the purpose of drawing cables into conduits.

A member of the Hamilton Board of Trade, Mr. Marsh is also Chairman of the Hamilton Branch of the Canadian Manufacturers' Association, 1916; member of the Canadian Electrical Association; member of the National Electric Light Association.

Mr. Marsh's clubs are: Hamilton, Hamilton Golf and Country, Canadian Rotary (all of Hamilton); Engineers', Montreal. His societies are A.F. & A.M.; his recreations, golf, fishing, and his religion Protestant. He resides at 14 Robinson Street, Hamilton, Ontario.

and it is very unlikely that the situation will be relieved this year. Pittsburg quotations on billets and sheet bars have recently been advanced, and it is anticipated that the top has not yet been reached, as many of the mills are booked well into 1917, with no abatement in the general demand. The steel plate requirements for shipbuilding purposes are in excess of the supply as the mills are able to furnish but a portion of that needed to carry on the heavy work that is being placed on this branch of the industry. Another feature that bears upon the plate situation is the large volume of business being done by car companies who in many cases are seriously handicapped by the lack of raw material. With the general upward trend of steel prices, it is expected that an early advance will be made on sheets. The mills are so pressed that deliveries are being extended; the makers in some instances being unable to ship material in the specified time. Owing to the heavy consumption of wire and wire products, a scarcity is beginning to loom up, which is thought will result in further advances on these lines. Recent demand for wrought iron pipe and boiler tubes is heavy, indicating renewed activity, and reflecting the trade conditions in this branch of the steel industry. While some price changes are reported on the New York market, and all quotations are very firm, local dealers are holding quotations at last week's figures.

**Metals.**

The metal situation is anxiously awaiting the closing of the pending contract for enormous quantities of copper required by the British and French Governments; the exact amount of this order is not yet known, but reports are circulated that it is in the neighbourhood of 200,000 tons. Tin is apparently strong at present, but the stability of the situation is doubted in some quarters. Spelter is very quiet and developing a weaker tendency. Lead is quiet after the advance. The demand for antimony is light on a declining market.

**Copper.**

Despite the high prices that copper is commanding at the present time, the demand continues to be very heavy. This does not apply alone to the war requirements, as the consumption of copper for domestic purposes is also of considerable proportion, owing to industrial expansion, following the abnormal conditions of the past two years. The output of marketable metal is somewhat restricted, as a result of labor troubles and the curtailed production owing to lack of sufficient refining facilities to take care of the smelted product. The interest of the trade at present is centered on the pending negotiations of an excessive

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

**Montreal, Que., Sept. 25, 1916.**—Unceasing activity continues to reflect the prosperous condition of all branches of the country's industries. While the crop returns may not be as satisfactory as at first indicated, the general trade conditions will not be affected in the same proportion as a failure under normal conditions, as the general prosperity is largely the result of war requirements. Trade conditions cannot be better indicated by reference to the new war loan now being issued which promises to far exceed the amount required.

**Pig Iron.**

A stronger tendency has developed in pig iron, and with the increasing de-

mand, prices are showing an upward trend. Production is still proceeding at full capacity, and the abnormal requirements of the trade may mean still higher prices.

**Steel.**

The curtailment of production, which was so marked a few weeks back, is gradually resuming the condition that prevailed before the warm weather set in. In addition to better working conditions, more help is available, owing to men being released from the harvest fields. The pressure upon the steel mills is becoming greater, and the scarcity of steel is more pronounced, and it seems apparent that the high prices now prevailing will be still further advanced

British contract, which, if closed, will result in the largest sale yet made in the history of the industry. The London market is very firm, showing an advance of 10s on spot and £1 on futures. The New York market is quiet, but very firm in anticipation of heavy business. Electro has declined  $\frac{1}{8}$ c, while castings are a little stronger on a similar advance; current quotations being  $28\frac{1}{2}$ c and  $26\frac{1}{4}$ c respectively. Lake is steady at  $28\frac{1}{4}$ c. Local dealers report a fair market, but quotations firm and unchanged at 31c for Lake and Electrolytic, and 30c for castings.

#### Tin.

The market in tin is very firm, and while no great activity is reported, there is a tendency to advance prices, following the strong tone of the British market, which has shown a general advance of over  $\frac{5}{8}$ c. per pound. New York reports an advance of  $\frac{1}{2}$ c., putting the nominal quotation at  $38\frac{7}{8}$ c per pound. The local situation is fairly active and dealers are asking  $44\frac{1}{2}$ c, an advance of  $\frac{1}{2}$ c per pound.

#### Spelter.

The market is very quiet, the past few days having taken on a still weaker tendency. The steadying condition so marked a few weeks ago seems to have entirely disappeared, and present indications point to a still lower market. Increased interest in the galvanized trade may steady the spelter situation, but it is thought that sheet mills are well supplied for immediate needs. The New York situation is easier, quotations having fallen off  $\frac{1}{8}$ c per pound; the nominal price being now  $9\frac{1}{2}$ c per pound. Dealers here report a quiet situation, but are still quoting last week's price of 13c per pound.

**Lead.**—While the market has become very quiet, and inquiries are not heavy, it is thought that the lack of interest is of short duration, as everything points to an early activity both here and abroad. Local dealers report a fairly active market with an advance of  $\frac{1}{4}$ c per pound, the nominal quotation being 9 cents per pound.

**Antimony.**—Inquiries for antimony are very light, and in the absence of any great demand, the market is exceedingly quiet with a declining tendency. A drop of  $\frac{3}{8}$ c. per pound on the New York market puts the present quotation at  $11\frac{3}{8}$ c per pound. The market here is quiet, following a brief show of activity. Prices are unchanged at 16c per pound.

**Aluminum.**—Nothing has transpired to alter the situation, and quotations are firm at 68c.

#### Machine Tools and Supplies.

Activity throughout the machine tool industry has again increased. In addition to the heavier shell requirements

the demand for domestic equipment for ordinary purposes is showing constant improvement. Delays on shipment are becoming greater, and buyers are experiencing some difficulty in obtaining delivery, which in some cases is being extended. A steady demand is maintained upon all classes of machine tool accessories and supplies. Prices are well maintained.

#### Scrap.

The apparent scarcity of heavy melting steel scrap is resulting in a firmer position being taken by dealers and sellers of this material. The increase in the demand for various grades of pig iron is also affecting the old metal market. Dealers report an active demand for various kinds of old metals, but while New York prices are stronger, the quotations here are unchanged.

#### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

**Toronto, Ont., Sept. 26.**—The extraordinary success of the latest war loan reflects the prosperous conditions prevailing in this country, and will have a stimulating effect in business circles. As the money will be spent on munitions and other war supplies, the greater part of the loan will remain in the country, and will consequently benefit considerably those industries associated with war orders. It also means more large orders for munitions and a continuance of the present activity in our steel mills and shell plants.

#### Steel

The situation in the steel trade is getting tighter and the market steadily gaining in strength. With the demand on the increase and deliveries getting more backward, indications point to higher prices on steel bars, plates and tubes before the end of this year. The problem of deliveries on steel products is becoming increasingly important, as the demand is getting ahead of the supply, notwithstanding the increase in capacity of the mills to take care of a much heavier tonnage. The U. S. Steel Corporation have withdrawn prices on bars in this market on account of the difficulty in naming delivery dates, due to the heavy unfilled tonnage, which is increasing each month. This indicates that a further advance may be made in

prices in the near future, which would no doubt be followed by similar action by Canadian mills. An advance in boiler tubes may be announced, as prices are very firm and demand heavy. The mills are sold up for five to six months on locomotive and merchant tubes. There is an extraordinary demand for plates in the primary market, principally for ships, and higher prices are inevitable, as the mills are sold up for at least ten months. The great scarcity of steel rails has reached a point where the Government may remove the duty temporarily to permit the railways to satisfy their more urgent requirements. The shortage is due to the mills producing shell steel almost exclusively, only one mill now rolling rails and in smaller tonnages than formerly.

Black sheets have advanced to 3c in the United States, and there is a possibility of still higher prices, as an advance of \$3 a ton is looked for in sheet bars. Blue annealed sheets continue in good demand at unchanged prices. The galvanized sheet market is stronger on account of the increased strength of spelter and high cost of sheets; quotations, however, are unchanged.

Increasing strength characterizes the steel market in the United States, and indications point to higher prices. Buyers of steel are finding it difficult to place their orders excepting for far distant deliveries, but are buying at prices which hitherto they had refused to consider. There is practically no limit to the demand for steel now, with the result that the mills are getting more congested than ever.

#### Pig Iron

The pig iron market is very strong, and there is some talk locally of an advance in prices. The demand for basic iron continues very heavy, while there has been better inquiry for foundry grades. The pig iron market in the States is stronger and prices have advanced on some grades. Bessemer is now quoted at \$22.20, gray forge \$18.95 Pittsburg, and basic Valley furnace, \$18.25 per ton. Hamilton No. 1 is unchanged at \$24, and Victoria No. 1 at \$25.

#### Scrap

The market for old materials is holding fairly steady, and business is brisk. Scrap copper has advanced, but otherwise quotations are unchanged. The advance in copper is equal to  $1\frac{1}{2}$ c per pound, which brings crucible copper up to  $22\frac{1}{2}$ c; heavy copper 22c, and copper wire  $22\frac{1}{2}$ c per lb. Lead is a shade higher, heavy lead being quoted at 6.25c and tea lead 5.25c per pound.

#### Machine Tools

The machine tool market continues active, business being confined almost entirely to large-swing lathes for munition plants. Owing to the demand for this

class of equipment, both in Canada and the States, deliveries are getting more backward. The market for smaller tools, such as milling machines and tool makers' lathes, is quiet, as they are very hard to get.

### Supplies

The general situation with regard to supplies is unchanged, but the market is very firm. There have been few price changes made during the week, but there is a decided upward tendency in values and an advance in some lines, principally steel and brass goods, may be looked for. Owing to prevailing conditions in the steel market, some lines of supplies are hard to get and dealers' stocks are low. Linseed oil and turpentine are unchanged, while lead has advanced 50c per 100 lbs., following increased strength in the pig lead market. Gasoline is firm and unchanged, but it is believed that prices of crude oil may advance, as production has declined, although there has been no falling off in the demand.

### Metals

The continued strength of copper and advance in the price of lead are the

principal features of interest in the metal markets this week. In the case of copper the strength will be maintained, as the demand promises to be exceptionally heavy for many months. Lead, on the other hand, is more liable to fluctuate, as past events have proved. There is little of interest to note in the other metals, although the position of spelter has improved to some extent. The market locally is steady and the situation satisfactory.

**Copper.**—Reports of heavy purchases of copper by the Allies have not as yet materialized, but they will sooner or later have to come on the market. For this reason producers are indifferent, as they are practically sold up for the remainder of this year. Export buying, however, is heavy, as is also domestic demand. Brass mills are buying large supplies of copper, and more will be needed to cover war orders, which have been booked recently. The market is very strong, and further advances are expected. Local quotations unchanged and firm at 30c per pound.

**Tin.**—There has been a reaction in the London market, but New York is un-

changed and quiet. A buying movement in tin is looked for, as stocks are being used up, and will have to be replenished. Local price is 44c per pound.

**Spelter.**—The market is quieter, following improved business last week, but prospects look better for a more active demand. Spelter is quoted locally at 14c per pound.

**Lead.**—The market is more active, the "Trust" having advanced their price twice during the week, to 6.75c and finally to 7c New York. Independents are quoting a shade lower at 6.97 $\frac{1}{2}$ c New York for both spot and November deliveries. Lead has advanced  $\frac{1}{4}$ c locally, and is quoted at 9c per pound.

**Antimony.**—The market is stagnant and prices nominal at 18c per pound.

**Aluminum.**—The market is a little stronger, but prices are nominally unchanged at 68c per pound.

**Montreal, Que.**—The Dominion Steel Corporation has just signed a contract covering the company's entire output of steel for high explosive shells for the first six months of 1917.

## CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

# INDUSTRIAL <sup>A</sup><sub>N</sub><sup>D</sup> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**Fergus, Ont.**—Beatty Bros., are building an extension to their foundry.

**Ottawa, Ont.**—The Ottawa Car Co. will build an addition to their plant.

**Tillsonburg, Ont.**—The Maple Leaf Harvest Tool Co. has decided to proceed with an extension to its plant.

**Dauphin, Man.**—The Dauphin Milling Co. is in the market for a Corliss engine, size about 15 in. x 36 in. stroke.

**Toronto, Ont.**—The Canada Metal Co. will build an addition to their plant on Fraser Avenue, to cost about \$25,000.

**Fergus, Ont.**—The Superior Barn Equipment Co., will soon have completed the building of their new factory.

**Winnipeg, Man.**—The C. N. R. has let the contract for the erection of a machine shop at Rainy River, Ont., to cost \$8,000.

**Trail, B.C.**—The Consolidated Mining & Smelting Co. have recently installed plants for making nitric acid and aluminum.

**Georgetown, Ont.**—Harley-Kay have purchased the machine business and plant of the Georgetown Foundry and Machine Co.

**Nelson, B.C.**—The West Kootenay Power & Light Co. will construct an 8,000 h.p. unit addition to its plant at Upper Bonnington Falls.

**Espanola, Ont.**—It is understood that the Spanish River Pulp & Paper Co. are considering the erection of a sulphite plant here, which will have a capacity of 70 tons.

**New Westminster, B.C.**—Henry Schaahe has leased a site on Tenth Street, on which he proposes to erect a machine, pattern and boiler shop to cost about \$70,000.

**Brantford, Ont.**—Good progress is being made on the new factory for the Dominion Steel Products Co. The main building will be 370 ft. by 90 ft., and will be completed by October 25.

**Hamilton, Ont.**—The Brown-Boggs Co. have taken out a building permit for reconstruction and extension to their factory. H. G. Cristman & Co., have been awarded the contract at \$2500.

**Merritton, Ont.**—The extensions to the sulphite mill of the Riordon Pulp and

Paper Co. are nearly completed and good progress is being made with the installation of the bleaching apparatus. The outlook is that the company will be turning out bleached sulphite at this plant next month and, when the new apparatus is in full operation, the entire output of the Merritton works will be bleached.

**Espanola, Ont.**—It is reported that the Spanish River Pulp & Paper Co. is considering the erection of a sulphite plant at Espanola, Ont., to have a capacity of 70 tons. It is pointed out that the company has for some time felt the need of a sulphite division at this point, the nearest chemical pulp plant being at Fraser Falls. The four new grinders at the Espanola plant will soon be in operation, making a total of 28 in all.

## General Industrial

**Granby, Que.**—The Granby Elastic Web Co. are building a factory here.

**Montreal, Que.**—The Canada Starch Co., of this city, will build a factory at Fort William Ont.

**London, Ont.**—An elevator will probably be built at Port Stanley at a cost of \$100,000. A by-law may be submitted to the ratepayers in January.

**Camrose, Alta.**—The Columbia Grain Co., of Winnipeg, will build an elevator here, probably next spring. A warehouse is being built now. Thomas Dub is the local manager.

## Municipal

**Nokomis, Sask.**—The Town Council will install an electric light and power plant.

**Lindsay, Ont.**—The Town Council propose extending the system of water mains.

**New Glasgow, N.S.**—Tenders will be called shortly for the construction of waterworks extensions, estimated to cost \$100,000.

**Hull, Que.**—The City Council will make considerable extensions to the waterworks system. Cast iron pipe will be required.

**Chatham, N.B.**—The Town Council will purchase a semi-diesel oil engine, direct-connected, a dynamo and an exiter at a cost of \$13,600.

**Aylmer, Que.**—The Town Council are issuing \$45,000 debentures for the purpose of constructing a rapid sand gravity filtration plant.

**Sherbrooke, Que.**—The Waterworks Committee are considering the installation of a vertical plunger pump, with a capacity of 4,000,000 gallons.

**Kingsville, Ont.**—The Town Council are considering making improvements to the waterworks system. F. W. Thorold, of Toronto, is the consulting engineer.

**Niagara Falls, Ont.**—By-law granting tax exemption for ten years to the Perfection Motor & Tire Co., Madison, Wis., was passed by the ratepayers on September 18.

**New Glasgow, N.S.**—The City Council have decided to extend the water distribution system, and will require a considerable quantity of 10 in., 12 in., and 16 in. cast iron pipe.

**Hamilton.**—The City Council have decided to invite tenders on two kinds of steam pumps for the Beach pumping station and will also have an estimate prepared as to the cost of a twenty million gallon reservoir.

**Dunnville, Ont.**—The vote by the ratepayers of Dunnville last Monday on the by-law to install the Hydro-Electric power and light was: For, 412; against, 19. On the by-law to issue debentures for \$53,000 to take over the total electric plant in connection with the Hydro, the result was: For, 412; against, 10. The by-law to extend the franchise of the Dominion Natural Gas Company for another ten years resulted: For, 460; against, 9.

## Tenders

**Toronto, Ont.**—Tenders will be received up to Tuesday, October 3, 1916, for the supply and delivery of 20-inch cast iron pipes, cast iron special castings and valves. Specifications may be obtained at the Works Department, Room 12, City Hall.

**Toronto.**—Tenders will be received until October 2, addressed to the Chairman of the Toronto Harbor Commissioners, and marked "Tenders for Cherry Street Bascul Bridge." All information may be obtained by applying to E. L. Cousins, chief engineer and manager.

**Oshawa, Ont.**—Tenders are invited for work and material required in the construction of a heating chamber, and also for the installation of a complete steam heating system in the car barn and workshops of the Oshawa Railway Co. Plans and specifications may be seen at the office of the superintendent at Oshawa.

**Hawkesbury, Ont.**—Tenders will be received until October 2 for installing an electric pump-driven turbine, of one of the following capacities: Half a million Imperial gallons per 24 hours; three-quarter million gallons, and one million Imperial gallons. Specifications will be furnished on application to M. Gareau, clerk of the municipality.

**Toronto, Ont.**—Tenders will be received up to Tuesday, October 3, 1916, for the supplying of: Four standard gasoline equipments installed complete, with galvanized steel tanks 14-gauge of 500 gallons capacity each. Forms of tender and specifications can be obtained upon application at the office of the Fire Department, Adelaide Street Fire Hall, Toronto.

**Toronto.**—Tenders will be received by the Chairman, Board of Control, City Hall, Toronto, up to October 3, 1916, for the manufacture, supply and erection of one twelve-inch venturi meter and register, indicator recorder at the Main Sewage Disposal Works, Toronto. Specifications may be seen and forms of tender obtained at the Works Department, Room 6, City Hall.

**Ottawa, Ont.**—Tenders will be received until Monday, October 2, 1916, for the supply of post office sorting cases Nos. 1257, 1259 and 1264. Plans and specifications to be seen on application to the Clerk of Works, Postal Station "F," Toronto, Ont.; to the overseer of Dominion Buildings, General Post Office, Montreal, P.Q., and at the Department of Public Works, Ottawa.

**Peterborough, Ont.**—Tenders will be received by Ed. M. Elliott, Esq., County Clerk, Peterborough, Ont., up to Saturday, Sept. 30, for taking down and rebuilding the west pier of the Wallace Point Bridge, over the Otonabee River and Trent Valley Canal. For plans, specifications, forms of tender, and other information, apply to the engineers, Bowman & Connor, 31 Queen Street W., Toronto.

**Winnipeg, Man.**—Tenders, addressed to the Chairman, Board of Control, will be received up to Tuesday, October 3rd, 1916, for the supply and delivery, f.o.b. cars Winnipeg, of quantities of lead-covered paper insulated cable. Instructions to bidders, specification and form of tender may be obtained at the office of the City Light and Power Department, 54 King Street.

**Toronto.**—Tenders for stores, office and garage buildings at Murray and Caer-Howell Streets, addressed to the Chairman of the Toronto Electric Commissioners, will be received until Oct. 2, 1916. Plans and specifications will be open for examination and explanation at the office of the architects, 908 Royal Bank Building, Toronto, and a further set of plans and specifications may be inspected, but not obtained, at the office of the purchasing agent of the Hydro-Electric System, Hermant Building, Toronto.

**Ottawa.**—Tenders will be received up to October 2 for the undermentioned metal supplies for delivery to H.M.C. Dockyards at Halifax, N.S., and Esquimalt, B.C.: Items 1, steel angles, bars, sheets and plates; 2, iron bars, fire bar; 3, brass bars and sheets; 4, copper sheets and bars; 5, solder tin and alloys; 6, tubes brass and copper. Forms of tender and full information may be obtained by application to the Department at Ottawa, or to the Naval Store Officers at H.M.C. Dockyard, Halifax, N.S., and Esquimalt, B.C. In making application for forms, the particular item or items for which forms are required should be clearly stated.

## Personal

**P. F. Fosnight**, Canadian representative of the Vanadium-Alloys Steel Co., Pittsburgh, Pa., was married recently at Hamilton, Ont.

**J. C. Wallace**, president of the American Shipbuilding Co., of Cleveland, Ohio, paid a visit recently to the chief officials of the Western Drydock and Shipbuilding Co., Port Arthur, Ont.

**Charles J. Barr**, formerly general superintendent of the Tennessee Coal, Iron and Railroad Co., has been appointed general manager of the Algoma Steel Corporation, Sault Ste. Marie, Ont.

**Lord Shaughnessy** and an inspection party of C. P. R. directors, including R. B. Angus, Sir Edmund Osler, Sir Herbert Holt, W. D. Matthews, A. M. Nanton and E. W. Beatty, have left Vancouver on their return East.

**George E. Archdeacon** has been appointed general manager of the Canadian Hart Accumulator Co., St. Johns, Que. Mr. Archdeacon was formerly upon the staff of Messrs. Ferranti and the Chloride Electrical Storage Co., in England.

**W. J. Parker**, who was assistant sales manager of the Standard Tool Co., is now associated with E. E. Lenarz in the Cleveland Power Transmission Co., Garfield Buildings, Cleveland, Ohio. The

Company specializes in small tools such as carbon and high-speed drills, reamers, cutters, etc.

## Contracts Awarded

**Fort William, Ont.**—Barnett & McQueen Co. have been awarded the contract for an extension to the elevator by the Ogilvie Flour Mills.

**London, Ont.**—A contract has been awarded by the Dominion Government for the construction of a \$100,000 concrete pier at Port Stanley.

**Montreal, Que.**—The Northern Electric Co., Montreal, has secured a contract for about \$300,000 worth of underground cables for the Montreal Tramways Co.

## Trade Gossip

The International Metal Works, of Brockville, Ont., have been incorporated with a capital of \$30,000.

The Berlin Furniture Co. has changed its name to that of the Jacques Furniture Co., and the capital stock has been increased to \$850,000.

The Canadian Sarco Engineering Co. have obtained an order from the town of Le Pas, Man., for two De Laval sewage pumps, to be direct connected to Canadian Westinghouse motors.

The International Engineering Co., Amherst, N.S., have been awarded a contract for two 600 h.p. water tube boilers by the Goodyear Tire & Rubber Co., for their new plant at New Toronto, Ont.

The Turbine Equipment Co., Toronto, are installing a 24-in. De Laval pump, 16 million gallons daily capacity against 60 ft. head, at Sidney, N.S. It is direct connected to a 250 h.p. Canadian Westinghouse motor.

**Orillia, Ont.**—The first ferro-molybdenum to be produced commercially in Canada was run September 20 at the plant of the International Molybdenum Co. here. Three electric furnaces are now running steadily.

**Trade Openings in Britain.**—Applications from firms in the United Kingdom for the names of manufacturers or producers of the following articles have been recently received at the commercial intelligence branch of the Board of Trade in London.

Electrical Apparatus—Plated metal fronts and reflectors for portable electric hand lamps.

Machinery Equipment—Automatic machines for making cup and square hooks; baling presses; button-making

# Tool Room Lathe

As a mainspring is to a watch, so is the tool-room to the munition shop. As it is the mainspring, highest efficiency, then, is required. In

this regard we invite your inquiries for this lathe which we claim will give this highest efficiency. It's a 14' x 6' LeBlond Lathe with taper draw-in attach-

ment and collets, relieving attachment and oil pan. It is a superior machine that will give entire satisfaction.

64-66 Front

Canada

## HAVE YOU GIVEN THE GEOMETRIC O.K. TO YOUR SCREW THREADS?

A Consulting Engineer writes us that he always recommends Geometric Thread-Cutting Tools. The reason is not hard to know. It is for this same reason that Geometric Screw-Cutting Tools are sought for every make of Screw Machine.

We are always glad to have thread-cutting propositions submitted to us. There is no charge for our recommendations. Send along your specifications, and our experts will recommend tools for your consideration. May we have your address for our mailing list, so that we can send you our publication, *THREADS*, each month? That will help us get acquainted. It is free.

**THE GEOMETRIC TOOL CO., New Haven, Conn., U.S.A.**

Williams & Wilson, Ltd., Montreal.

CANADIAN AGENTS:  
The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg, St. John, N.B.

*If any advertisement interests you, tear it out now and place with letters to be answered.*

machinery; distillation plant for carboniferous shale; machines for marking small pieces of round steel, about 6 in. long by  $\frac{1}{4}$  in. diameter; machinery for oiling silk; winnowing machines.

**Vancouver, B.C.**—Industrial plants are being laid down at different places along the main line of the Pacific Great Eastern, and it is expected that in a short time there will be opened up extensive sawmills at Green Lake, near Mons. as well as other points.

**Armstrong Bros. Tool Co., Chicago,** are building a 50 x 70 ft. steel and brick addition to their drop forging department. They are also erecting a reinforced concrete fireproof building, 60 x 130 ft., four floors, to be used for finished stock warehouse, shipping department and offices. These buildings, with new machinery and equipment to be installed, will largely increase the company's facilities.

**Russian Market So Offered Canadians.**—The Trade and Commerce Department, Ottawa, has received a report from C. F. Just, recently sent to Petrograd as Canadian Trade Commissioner, in which it is stated that a market for agricultural implements, other than harvesting machines, exists in the Petrograd district. Mr. Just sends a warning that Canadian firms should not delay in taking advantage of this new market. The formation of a point selling agency is suggested.

**The Independent Pneumatic Tool Co.** have recently made arrangements with the Garlock-Walker Machinery Co., 70 Front Street, Toronto, to act as their agents for the sale of "Thor" pneumatic tools in the Province of Ontario, east to Belleville. A stock of "Thor" tools will be carried by the Garlock-Walker

people in Toronto, and they will be able to give customers the very best of service. The Independent Pneumatic Tool Co. also maintain their own branch office at 334 St. James Street, Montreal.

**Dominions Royal Commission.**—The eastern itinerary of the Dominions Royal Commission, enquiring into methods of developing trade within the Empire, is announced. The commission will leave Winnipeg on October 11, and sit at Fort William October 12-13; Toronto, 14-22; Ottawa, 23-24; Montreal, 24-31, and Quebec, from November 1 to 4, when the commission will sail for England. Two years ago they visited the Maritime Provinces, when their enquiry was interrupted by the outbreak of the war.

**Hudson Bay Railroad.**—J. D. McArthur, who is building the Hudson Bay Railway, states that the line has been graded almost to Port Nelson, and steel has been laid for nearly three hundred miles. The contractors will have the road completed next year, or within the estimated time, but at the present are hindered by a shortage of labor. Great numbers of men have left the construction camps for the military camps. They were replaced in part by drafts from the alien interment camps, but this supply has now been exhausted.

**Montreal, Que.**—It is reported that the management of the Shawinigan Water & Power Co. have come into possession of a secret process for the manufacture of high-speed steel, and that the process is one which will produce that much-sought-after commodity much more profitably than it can be done at present. This steel is in great demand for shell purposes, and is only obtainable at advancing prices. The Shawini-

gan people are said to have secured a plant in Montreal, which will be in operation around October 15.

**Another Bridge at Niagara Falls.**—The Ontario & Niagara Connecting Bridge Co., an American concern, will construct a \$1,000,000 span near the point where the transmission line of the Niagara, Lockport & Ontario Power Co. crosses the stream in the town of Lewiston. The bridge site was selected at a meeting of the company's commissioners in the office of Frank A. Dudley at Niagara Falls, N.Y. The bridge will be for steam and electric railroads, vehicles and pedestrians. It will be of steel and concrete.

**Canadian Locomotive Co. Meeting.**—At the annual meeting of the Canadian Locomotive Co., held at Kingston, Ont., on September 20, all the old directors were re-elected, as follows:—Aemilius Jarvis, Toronto, president; J. J. Harty, Kingston, vice-president; Robert Hobson, Hamilton; J. L. Whiting, Kingston; Warren P. Soper, Ottawa; H. W. Richardson, Kingston. Executive—Frank G. Wallace, Kingston, general manager; William Casey, manager; J. J. Harty, sales manager; J. H. Birkett, secretary-treasurer. At the close of the meeting the directors reported that the prospects were very bright for the future, with plenty of orders on hand. The big order from Russia for 50 locomotives has been completed, and at the present time negotiations are on with foreign countries for more orders.

**May Remit Duty on Steel Rails.**—It was semi-officially announced on Sept. 20 that the Dominion Government is likely to temporarily remit the duty on steel rails imported into Canada. The reason given is that owing to the strain upon

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

**BRAZIL**  
Bahia, British Consul.  
Rio de Janeiro, British Consul General.

**CHILE**  
Valparaiso, British Consul General.

**COLOMBIA**  
Bagota, British Consul General.

**ECUADOR**  
Quito, British Consul General.

**EGYPT**  
Alexandria, British Consul General.

**FRANCE**  
Harre, British Consul General.  
Marseilles, British Consul General.

**INDIA**  
Calcutta, Director General of Commercial Intelligence.

**ITALY**  
Genoa, British Consul General.  
Milan, British Consul.

**MEXICO**  
Mexico, British Consul General.

**NETHERLANDS**  
Amsterdam, British Consul.

**PANAMA**  
Colon, British Consul.  
Panama, British Vice-Consul.

**PERU**  
Lima, British Vice-Consul.

**PORTUGAL**  
Lisbon, British Consul.

**RUSSIA**  
Moscow, British Consul General.  
Petrograd, British Consul.  
Vladivostok, British Consul.  
Odessa, British Consul General.

**SPAIN**  
Barcelona, British Consul General.  
Madrid, British Consul.

**SWEDEN**  
Stockholm, British Consul.

**SWITZERLAND**  
Geneva, British Consul.

**URUGUAY**  
Monte Video, British Vice-Consul.

**VENEZUELA**  
Caracas, British Vice-Consul.

## How Can a "Mike" Be Best?

We must admit that **any new** micrometer will probably measure to .001 of an inch with reasonable accuracy. What right, then, have we to say that a Starrett "Mike" is best? Simply because—it is obvious that the best micrometer is the one that suits every need of the mechanic and stays accurate longest. Such a tool is the

## Starrett Micrometer

No matter what you seek in micrometer service, there is a Starrett Mike for you—ratchet stop—lock nut—decimal equivalents, any size, many shapes. BUT the one big point is, that all Starrett micrometers can be **KEPT** accurate.

The patented sleeve adjustment is re-

sponsible. Micrometers, constantly used, are bound to wear, perhaps imperceptibly. In a Starrett, that wear can be quickly and accurately corrected by a slight turn of the sleeve adjustment. No other micrometer has so simple, nor so accurate a method for compensating for wear. That's just one more Starrett superiority.

If you are interested in tools, send for a copy of our free catalog No. 213 describing 2,100 styles and sizes of the finest make.

*If any advertisement interests you, tear it out now and place with letters to be answered.*

the steel rail industries in Canada in turning out shells and other war munitions there has necessarily been a reduction in the output of rails, and that the railways are now confronted with a shortage in supply. If the Government finds that the steel companies cannot meet orders placed by the railway companies there will be a remission of the tariff duty on a sufficient number of rails brought in from the United States to meet immediate requirements. This same course was pursued in 1912, when the railway companies found they could not get enough rails from the Canadian mills, although in that case the arrangement was made with the mills in order to enable them to fill their orders.

## Marine

**Port Arthur, Ont.**—The Government hydrographic steamer *La Canadienne*, which went aground in Black Bay a week ago, has been released, and will be put in the Port Arthur drydock for repairs.

**Victoria, B.C.**—The Victoria Machinery Depot has been awarded the contract for repairing the British schooner *Coquitlam City*, and it is expected that the work will cost in the neighborhood of \$4,000. Mr. Forsyth, of Brisbane, Queensland, owns the vessel.

**Halifax, N.S.**—The steamer *Amelia* which plys between Picton, N.S. and Prince Edward Island recently got \$100,000 salvage for towing into port the Belgian steamer *Inductionaire* which had been abandoned near the Magdalen Islands. It took the *Amelia* over five days to bring her prize to port at Port Mulgrave. The value of the *Inductionaire's* cargo, which was lumber, is estimated at \$200,000.

## Refrigeration

**Montreal, Que.**—The Montreal Arena Co. are building an ice storage.

**Grande Prairie, Alta.**—R. S. McDonald, of this town, proposes establishing a creamery here.

**Vancouver, B.C.**—The New England Fisheries Co. will build an extension to their plant, to cost about \$50,000.

## Railways—Bridges

**Hamilton.**—The City Council, at a special meeting held Sept. 19, approved of the proposal to construct a Hydro-Electrical Railway line from Port Credit to St. Catharines, via Hamilton.

**Baysville, Ont.**—The Central Radial Committee at a meeting held recently decided to inaugurate a campaign in favor of the proposed Gravenhurst-Baysville Hydro-Electric Railway.

**Deseronto, Ont.**—A meeting of the mayors of the different towns interested, was held here recently to advance the scheme of an electric railway under the management of Hydro-Electric Commission to be constructed and run from Picton through Deseronto to Napanee.

## Wood-Working

**Vancouver, B.C.**—The Alberta Lumber Co. will build a mill to cost approximately \$100,000.

**Simcoe, Ont.**—Fire destroyed the planing mill of J. E. Butler & Sons, at Victoria. Loss, \$3,000; no insurance.

**Harriston, Ont.**—The Harriston Casket Co., have decided to rebuild their plant which was recently destroyed by fire.

**St. Thomas, Ont.**—The Canadian Woodenware Products Co.'s plant which was recently destroyed by fire will probably be rebuilt.

**Aylmer, Ont.**—Fire completely destroyed Staley's sawmill just east of Glenholin on Sept. 18. The origin of the fire is unknown.

**Chicoutimi Que.**—A. Gagnon's saw mill was totally destroyed by fire with a loss of \$40,000. The mill will be rebuilt and new machinery will be required.

## New Incorporations

**Elora, Ont.**—The Canadian K. K. Co. has been incorporated to manufacture machinery, tools, iron, steel, etc. The new concern is capitalized at \$40,000, by Charles L. Dunbar, Leo W. Goetz, and H. M. McTague, of Guelph, Ont.

**The A. L. Johnson Shoe Co.** has been incorporated at Ottawa, with a capital of \$200,000, to manufacture boots and shoes at Montreal. Incorporators: A. L. Johnson, J. S. Hough, and A. E. Dilts, all of Montreal.

**Hamilton Brass, Ltd.**, has been incorporated at Toronto, with a capital of \$40,000, to manufacture all kinds of metal ware at Hamilton, Ont. The provisional directors are: H. S. Lees, J. M. Telford and R. P. McBride, all of Toronto.

**Manville Asbestos Co.** has been incorporated at Ottawa, with a capital of

\$1,000,000, to manufacture asbestos products, with head office at Montreal. Incorporators are: G. W. MacDougall, W. B. Scott and J. G. Cartwright, all of Montreal.

**Chelmsford Creamery, Ltd.**, has been incorporated at Toronto, with a capital of \$10,000, to establish and operate a creamery at Chelmsford, Ont. The provisional directors are: H. J. Gratton, John Bradley and G. Pacquet, all of Chelmsford, Ont.

**Scrap Metals, Ltd.**, has been incorporated at Ottawa, with a capital of \$49,000, to manufacture and deal in cast, wrought, sheet and wire metal and hardware products, etc., at Montreal. Incorporators are: E. J. Lyons, H. A. Larin, and A. G. Laporte, all of Montreal.

## FOUNDRYMEN'S CONVENTION AND EQUIPMENT

(Continued from page 336.)

James W. Campbell, secretary and treasurer, and Chas. H. Erickson, superintendent; J. B. Marshall, western representative and Charles C. Klingman, department manager.

**Thomas E. Coale Lumber Co., Philadelphia, Pa.**—Michigan soft cork white pine pattern lumber and California sugar pine. Represented by Thos. E. Coale, president; E. C. Anderson, assistant to president, and A. Warren Anderson, salesman.

**Curtis Pneumatic Machinery Co., St. Louis, Mo.**—Air compressor, reciprocating hoist, single I-beam crane, closed hopper hand blast, single I-beam trolley, photographs of representative installations of Curtis pneumatic elevators, and such equipment that we manufacture which is not exhibited itself. Represented by L. C. Blake, Charles E. Stamp, and F. F. Seaman.

**Dalton Adding Machine Co., Cincinnati, O.**—Dalton adding, listing and computing machines, hand and electric driven. Represented by R. Lancaster Smith, Ohio, sales agent; D. C. Boyer, A. J. Anderson, A. S. Harris, Miss W. Flynn.

**Davenport Machine & Foundry Co., Davenport, Ia.**—Molding machines.—Represented by Carl Falk, manager molding machine department, and John T. Anderson, superintendent and manager.

**Davis-Bourneville Co., Jersey City, N.J.**—Stationary and portable type oxy-acetylene welding and cutting apparatus, including the Davis neutral flames torch, also No. 2 Oxy-graph, and No. 1 radiograph for automatically cutting steel. Represented by Hugh H. Dyar, district sales manager, Cleveland; Harry W. Gill, Hugo A. Lindholm, Wm. H. Joyce and Alex. Blaser.

**Wm. Demmler & Bros., Waukegan, Ill.**—Automatic coremaking machine in operation. Represented by H. L. Demmler.

**Joseph Dixon Crucible Co., Jersey City, N. J.**—Graphite products, including crucibles, stoppers, nozzles, sleeves, phosphorizers, stirrers, foundry facings and a full line of the Dixon products. Represented by D. A. Johnson, manager, Chicago branch; H. C. Sorenson, F. R. Brandon and J. A. Biel.

**Electric Controller & Mfg. Co., Cleveland.**—Stereopticon views of lifting magnets and automatic machine tool controllers in operation at various plants. Represented by F. R. Fishback, district manager, and M. Converse and W. H. Beatty, sales department.

**Excelsior Tool & Machine Co., East St. Louis, Ill.**—Automatic grinding and polishing machine for polishing stove tops, motor driven. Automatic grinding and polishing machine for polishing pipe, motor driven. Motor driven double arbor polishing and buffing lathe. Represented by T. F. Philippi, president.

**Federal Foundry Supply Co., Cleveland.**—Foundry Supplies. Represented by W. J. Adams, president; Ralph Ditty, treasurer and

# WIRE SPRINGS

OF ALL KINDS

Machine Springs, Valve Springs, Automobile Cushion Springs, etc., of a quality that defies competition. Tell us your requirements. Send sample or specification for price.

**JAMES STEELE, LIMITED**  
GUELPH, ONTARIO

general manager; Thos. Ware, secretary; E. Kaye, C. A. Collins, I. D. Adams, L. H. Heyl, John Bayer, W. J. Smith and John Mertes, salesmen.

**Belt & Tarrant Mfg. Co., Chicago.**—Adding and calculating machines. Represented by William F. Sims.

**Foundry Equipment Co., Cleveland.**—Stationary Core ovens of the roller drawer type, brass furnaces, aluminum furnaces, sprue cutters, squeezers, crucible lever lifters, coremakers' benches and oil burners. Represented by Julius Tuteur, president; F. A. Coleman, general manager, and C. A. Barnett, treasurer.

**The Foundry and The Iron Trade Review, Cleveland.**—A display of artistic gray iron castings which have been collected in all parts of the world.—Represented by A. O. Backert, George Smart, H. Cole Estep, J. D. Pease, R. V. Sawhill, E. C. Kreutzberg, A. L. Kluge-man, L. C. Pelott, S. H. Jasper, A. W. Howland and F. V. Cole.

**Gardner Machine Co., Beloit, Wis.**—Disc grinders for metal grinding, both belt and motor driven, to carry disc wheels ranging in diameter from 12 inches to 32 inches. Pattern-makers' disc grinders and roll sanders, belt and motor driven polishing lathes in various sizes, ring wheel chucks, abrasive discs, and a general line of disc grinder supplies. Finished samples of work done on disc grinding machines. Represented by L. W. Thompson, president; F. E. Gardner, vice-president; E. B. Gardner, secretary; W. B. Lelshman, treasurer; D. C. Graves, W. L. Townsend; J. M. Gardner, and E. L. Beisel.

**General Electric Co., Schenectady, N.Y.**—Industrial control, arc welding equipments, electric motors, "Mazda" lamps, cloth gears and pinions. Centrifugal blowers and flow meters. Represented by J. A. Ham, J. A. Seede, J. Eaton, R. E. Wooley, O. W. Buddington, L. W. Shugg, W. J. Hanley, G. E. Guy, and J. A. Boers.

**Gisholt Machine Co., Madison, Wis.**—A display of the Periodograph as a means of obtaining accurate job time records at low expense. Applications to various factor conditions will be shown. Represented by W. J. Hannum, R. M. Carter and H. E. Preston, sales representatives.

**Goldschmidt Thermit Co., New York City.**—A complete line of samples of various metals and alloys produced by the Thermit process. Samples of ferro-silicon. Sample thermit welds and photographs of important work. Represented by DeCoursey B. Brown and H. G. Spilsbury, metallurgical engineers; J. G. McCarty, H. D. Kelley and Edwin B. Bloom, representatives.

**Gordon Sand Co., Conneaut, Ohio.**—Represented by F. E. Gordon, president; U. E. Kavel, sales manager; W. R. Thompson and H. A. Keener.

**Graceton Coke Co., Graceton, Indiana Co., Pa.**—Foundry coke. Represented by C. M. Lingle, general manager; M. F. Brandon, mining engineer; W. H. Gates, mine superintendent, and T. M. Doherty, coke superintendent.

**Great Western Mfg. Co., Leavenworth, Kans.**—Combs gratory foundry riddles with rectangular sieve for continuous riddling, and "Combs" gyatory riddle for contractors' use. Represented by F. A. Pickett, secretary, and George W. Combs, superintendent.

**F. A. Hardy & Co., Chicago.**—Complete line of safety glasses, helmets and eye protectors for industrial uses, making a specialty of the Hardy welding glass with "Noviweid" lenses and the "Harco" safety glass. Represented by C. S. Wells, Chicago, and W. B. Gosman, New York.

**Benj. Harris & Co., Chicago.**—Metals. Represented by Nathan Harris, Oscar Harris and Louis Goldman.

**Hauck Mfg. Co., Brooklyn, N.Y.**—Compressed air and hand pump cupola lighters, skin-drying outfits, kerosene torches, core oven burners, ladle heaters, rivet forges, blacksmith and brazing forge, aluminum melting furnace. Represented by A. Busch Hauck, vice-president, and A. P. Link.

**Hayward Co., New York.**—Hayward electric motor clam shell bucket, two-line clam shell buckets, two-line orange peel buckets, and drag scraper buckets. Represented by C. F. Hutchings and H. M. Davison.

**Herman Pneumatic Machine Co., Pittsburgh, Pa.**—Herman plain jarring machines, showing mechanical construction. Represented by Thos. Kaveny, president and general manager; A. M. Fraunheim, vice-president; Alfred Herman, vice-president and superintendent; H. T. Fraunheim, treasurer; Robert Ringle, works manager and engineer; Andrew Rodgers, R. P. Morgan and Robert Walker, sales representatives.

**Herold Bros. Co., Cleveland.**—A complete line of brushes for the foundry trade, including

**BERTRAMS LIMITED**  
Engineers  
Sciennes, EDINBURGH  
PAPER MILL MACHINERY  
and  
MACHINE TOOLS FOR IRON WORKERS  
Catalogues offered to Purchasers.

**JOHN STIRK & SONS, Limited**

Toronto, Winnipeg, Vancouver, St. John, N.B.

## The Metals Coating Co. of Canada, Ltd.

Versailles Building, 90 James St.  
MONTREAL, CANADA

A machine gun making its ammunition from Reeled Wire, and coating objects by bombarding with minute plastic particles of metal. The Schoop method of Metallic deposition, any object and any size coated with a positive adhesive and homogeneous coating with any metal for any desired thickness.

Solves one of the greatest problems heretofore confronting the structural engineer, because it produces on iron or steel a permanent coating not susceptible to corrosion.

Carbons can be coated with copper, etc.

For full information write for booklet "D".

## An Ideal Locker for Clothes and Personal Tools

This combination Tool and Clothes Locker will be very useful to the mechanic because it provides ample space for clothes and a safe place for his tools.

Built for life-time service. Supplied in unit or group construction.

We also manufacture STEEL SHELVING FOR ALL PURPOSES. Drop a line for full details.

## CANADA WIRE & IRON GOODS CO.

HAMILTON, ONTARIO  
Eastern Representative: H. E. O. Bull  
184 Mance St. Montreal, P. Q.

# "PURO - FY"

(MADE IN CANADA)

THE American Museum of Safety conferred a Gold Medal Award upon the Puro Sanitary Drinking Fountain at the First International Exposition of Safety and Sanitation.

The Puro Sanitary Drinking Fountain won because it deserved to win—Puro had merits that made it stand head and shoulders above any other drinking apparatus.

**Safe** **Simple**  
**SANITARY** **Economical**  
**Quickly Attached**

These are the qualities that forced the leading safety and sanitary engineers to pick Puro in preference to all others.

No device can be as efficient that does not contain all these qualifications; and Puro was not tied for first place; Puro was first.

Don't be satisfied with half-way goodness, or makeshift drinking arrangements for your employees.

If the men in your factory must drink, give them a clean drink.

Puro is clean—it does not rust or corrode.

Puro is economical. It allows just the proper amount of cool, clean, fresh water to come through the bubbler. No spurting, no overflowing, no loss. Puro regulates itself. You can attach it in five minutes.

Tell us how many men in your factory and your water pressure in pounds—

We'll tell you just what it will cost to "PURO-FY" YOUR WATER SUPPLY.

## PURO SANITARY DRINKING FOUNTAIN

TRADE MARK

147 University Ave. TORONTO, ONT.

## Second-Hand MACHINERY

bristle, horse hair, Tampico and welded wire circular brushes. Represented by A. B. Herold and H. G. Schluter.

**Hill-Brunned Foundry Supply Co., Cincinnati, O.**—Foundry supplies. Represented by John Hill, Bruce Hill and Fred J. Brunner.

**Hill & Griffith Co., Cincinnati, O.**—Electrically operated sand ridding machine. Represented by Wm. Oberhelman, F. McCarthy, J. M. Glass and J. A. Carey.

**Hoevel Manufacturing Corporation, New York.**—Catalogues, photographs, drawings and other descriptive material of complete line of sand blast machines and auxiliary equipment, especially revolving barrel sand blast machines, rotary table sand blast machines, sand blast chambers with turn table and rotary floor, and many special machines, dust filters, dust arresters, etc. Represented by H. F. Hoevel, president; F. W. Weiss, vice-president, and L. B. Lassmore, western representative.

**Holland Core Oil Co., Chicago.**—General exhibit of cores made with "Holland" oils. Featuring radiation and automobile work, made with Holland special foundry lined. Represented by H. L. Baumgardner, secretary and treasurer, and A. L. Fay, salesman.

**Herman A. Holz, New York.**—"The Brinell Meter." Portable apparatus for determining the Brinell hardness of metals and metal products. Represented by W. O. Little, sales engineer.

**Imperial Brass Mfg. Co., Chicago.**—Imperial oxy-acetylene welding, cutting and decarburizing equipment. Imperial oxy-hydrogen welding and cutting equipment. Represented by Frank McNellis, president; Charles E. Young, manager sales promotion; J. F. Schroeter, sales representative, and J. Meskan, foundry foreman.

**Independent Pneumatic Tool Co., Chicago.**—Thor pneumatic tools. Represented by J. D. Hurley, vice-president, and general manager, Chicago; W. R. Gummere, Cleveland manager, and R. T. Scott, Pittsburgh manager.

**Ingersoll-Rand Co., New York City.**—Imperial type belt driven compressor, Imperial motor hoist and complete line of "Little David" pneumatic tools, including sand rammer, riveters, chippers and drills. Represented by George A. Gallinger, manager pneumatic tool sales; W. A. Armstrong, manager Cleveland office, and George C. Williams.

**International Molding Machine Co., Chicago.**—Molding machines. Represented by Edward A. Pridmore, president; W. W. Miller, vice-president; J. W. Dopp and F. W. Hamel.

**Interstate Sand Co., Zanesville, O.**—Molding and silica sands, fire clays. Represented by E. M. Ayers, president; L. K. Brown, vice-president, and F. L. Moore, sales manager.

**The Iron Age, New York.**—Trade publications. Represented by W. H. Taylor, president; M. C. Robbins, general manager; Chas. S. Baur, advertising manager; Fritz J. Frank, secretary; D. C. Warren, New England manager; H. H. Roberts, Philadelphia manager; W. B. Robinson, Pittsburgh manager; Emerson Findley, central western manager; F. S. Wayne, western manager; A. I. Findley, editor; E. F. Cone, associate editor; F. L. Prentiss, central western editor, and O. J. Abell, western resident editor.

**Jamison Coal & Coke Co., Pittsburgh, Pa.**—Foundry coke. Represented by W. G. Ireland and E. J. Clancy.

**Jennison-Wright Co., Toledo, O.**—Kreolite wood blocks and structural timbers. Display will consist of several types of factory floor blocks designed to meet all conditions to be found in machine shops, foundries, pickling rooms, annealing rooms, forge shops, drive-ways, loading platforms, etc. Represented by H. G. Jennison, president; W. E. Wright, manager sales; F. W. Cherrington, chief engineer; E. M. Humphrey, H. P. Consaul and A. W. Cobley, salesmen.

**Charles C. Kavin Co., Chicago.**—Represented by Charles C. Kavin, president, and John F. Nellis, vice-president, Chicago; R. J. Courtney, Wm. J. Mulcahy, and J. H. Hopp, representatives.

**Julius King Optical Co., Chicago.**—Complete line of safety goggles, helmets, etc. Represented by W. G. King, vice-president; J. J. Duffy, F. W. King and A. G. Larson, salesmen.

**Lake Erie Smelting & Refining Co., Cleveland, O.**—Copper, spelter, tin, red ingots and yellow ingots. Represented by Emil A. Stotter, L. B. Stotter, Thomas Thomson and Harry Price.

**Lakewood Engineering Co., Cleveland O.**—Industrial cars, industrial track, factory trucks and handling buckets. Represented by W. A. Meddick and L. R. Wilson.

**H. M. Lane Co., Detroit, Mich.**—Represented by H. M. Lane, T. A. Leyshon, and C. T. Holcroft.

# Canada Foundries & Forgings Limited

## Brockville and Welland, Ont.

PLANT OF THE CANADA FORGE CO. DEVOTED TO THE PRODUCTION OF HEAVY MACHINERY FORGINGS.

*Interest is imparted to the various products of the plants herein described, by the fact, that, while their output represents succeeding stages of manufacture, much of their output is of primary importance to subsequent work by firms in other fields of industry. The broad field of distribution thus available is therefore independent of any limited class of industrial effort, and imparts a unique character to these establishments as a whole, which renders them largely indicative of the state of the country's general manufacturing activity.*

AS a producer of a wide range of finished and semi-finished goods, Canada Foundries and Forgings, Limited, occupies a position of present prominence, with all the promise of future potentiality to be derived from the various plants, which, previous to their acquisition by this company, had already established themselves as permanent members of Canada's manufacturing community.

Canada Foundries and Forgings, Ltd., was incorporated in 1912, when it took over the properties of The James Smart Manufacturing Co., Ltd., Brockville; The Canada Forge Co., Ltd., Welland, and Canadian Billings & Spencer, Ltd., Welland, all situated in Ontario, and enjoying established reputations as first rank producers in their respective lines. While sharing in the depression of 1913 and

1914, the outbreak of hostilities and the subsequent readjustments of world trade have maintained the various plants in a hitherto unprecedented state of productive activity. These three plants, by virtue of their community of interests and progressively related pro-

ducts, form a unit which, from a manufacturing standpoint, possesses an enviable range of products adapted to a wide market both at home and abroad. Thus it is that while much of the activity has been due to the requirements of semi-manufactured products for war

purposes, there has arisen at the same time an ever-increasing demand for many lines of hardware for domestic consumption and export. As a result of the present tide of prosperity, the various plants have attained a high degree of excellence in their equipment which augurs well for their successful participation in the future world trade.

The James Smart Manufacturing Co. has been in existence over 60 years, and manufactures stoves, furnaces, ranges, hot air generators, lawn mowers, hammers, axes, and tools of a

GENERAL VIEW OF MOULDING DEPARTMENT WITH MOULDS LAID OUT READY FOR POURING.

similar character, including all lines of hardware. Next in seniority is the Canada Forge Co., with a record of eleven years' active production of high grade machinery forgings, such as crank shafts, generator and motor shafts, marine forgings, large engine parts, and many similar lines. Canadian Billings & Spencer commenced operations two years later as a branch establishment of the Billings & Spencer Co., Hartford, Conn. This plant specializes on drop forging work of all sizes and descriptions, much of its product being of a finished nature, such as wrenches, turnbuckles, eyebolts, clamps, lathe dogs, etc., thus covering much of the ground intermediate between the two first mentioned plants, while the product of the three plants together finds outlets in almost every line of industry and commerce, from large engineering shops, building mammoth machines, to the smallest hardware store selling wrenches, hand hammers, axes, and domestic hardware.

The office of the holding company is situated at Brockville in the eastern part of the Province of Ontario, the officers and board of directors being at present constituted as follows:—President, Wm. M. Weir, Montreal; Vice-President, J. Gill Gardner, Brockville; Sec-Treas., John H. A. Briggs, Brockville, who, with the following gentlemen, constitute the board:—Henry Bertram, Dundas, Ont.; F. D. Canfield, New York; Hon. Geo. P. Graham, Brockville; F. C. Billings, Hartford, Conn.; John T. Dillon, Titusville, Pa.; Thos. J. Dillon, Welland, Ont.

Clarence F. Smith, Montreal; H. B. Housser, Toronto; Hon. W. J. Shaughnessy, Montreal.

track of the industrial life of the country is ideally situated, both for home and export trade, being adjacent to the main line of both the C.P.R. and G.T.R., on the north shore of the St. Lawrence River, 126 miles above Montreal.

While the record of this enterprising concern may not be unique in all respects, it is truly representative of the rise, development and steady growth of Canadian trade and industry. The James Smart Manufacturing Co. is one of the landmarks of Brockville, and an important contributor to the town's commercial prosperity. Like many another of Canada's industrial assets, the early progress of

ONE OF THE PRODUCER GAS ENGINES IN THE POWER PLANT.

#### JAMES SMART MANUFACTURING CO.

**T**HE plant of the James Smart Manufacturing Co. is located in the city of Brockville, Ont., and though apparently out of the beaten

this company was such as to necessitate the construction of wings and additions to the original plant, until the general appearance of the building reflects the long but constant growth of the enterprise. The business was first established in the early fifties, being founded by James Smart in 1854. It became incorporated in 1881 and has since that date progressed steadily, and may now be considered as one of the oldest, best known, and most efficient manufacturing plants in Canada.

It is not alone on the Canadian trade that the sound reputation of the firm has been established, as for many years the arms of progress have extended out to lands beyond the seas, bringing back to Canada some portion of the world's trade that is rightfully hers. The products of the factory are now being exported to great Britain, Australia, South Africa, and other countries, and trade conditions are being studied to enlarge on their present field, while the company also maintains a branch office and warehouse in Winnipeg, Man., to handle its extensive and rapidly growing North-West and Pacific Coast trade.

#### Range of Output.

To fully describe the various articles manufactured would be impossible in the space here permitted, as almost every conceivable piece of forged or cast hard-

MAKING SLEDGE HAMMERS IN THE FORGE SHOP.

ware is produced. Among the principal lines are heating stoves and ranges, warm air furnaces and registers. Their speciality in furnaces is the well known "Kelsey Warm Air Generator," which

tumbling room, where the smaller castings are subjected to the rumbling process to remove the sand. This department contains 14 mills, and in connection with the foundry, there is a three

passes through the shop, it is difficult to arrange the machinery so that each piece will follow a set course, but by means of jigs and fixtures, adaptable to several machines, the progress of the work has been arranged in a systematic and efficient manner.

A new wood working shop has been recently completed. It is 3 stories high, 140 x 80 feet, of modern construction, well lighted and fully equipped. The chief products of this department are school furniture, plumbers' cabinetware, hammer handles, etc., in addition to manufacturing all necessary shipping crates and boxes. A small section of this building is used for the pattern shop, where all the wooden patterns are designed and constructed. A feature of this department is the completeness with which safety devices are applied to all of the machines and apparatus.

#### Hammer and Axe Department.

High grade cast steel hammers, sledges, hatchets and axes constitute the main articles manufactured in the forging department, which is equipped with 12 trip hammers, two heavy drop hammers, eight forging presses and all the necessary furnaces and auxiliary equipment required for the efficient and economical handling of the various makes and sizes. To facilitate the rapid progress of the work, and at the same time turn out a uniform product, all the forging machines are fitted with special jigs and dies, so that each piece—as it is finished—is a duplicate of its fellow. The various operations in the making of these forgings are very interesting, and

VIEW OF PART OF THE MACHINE EQUIPMENT IN THE WOODWORKING DEPARTMENT.

has revolutionized the practice of warm air heating giving results in the way of ventilation combined with thorough warming that cannot be attained by any other method. In the general hardware department, builders' house furnishings, cabinet and carriage makers' hardware in cast and wrought iron and brass, pumps and plumbers' goods, wrought steel butts and hinges, lawn mowers and rollers, jack screws, vises, warehouse trucks, copying presses, and many lines of labor saving tools and machines are produced in large quantities.

#### Moulding Shop.

As castings of all sizes enter largely into nearly all of the lines of general hardware produced, the moulding shop may be considered one of the leading departments. Including the building where the brass furnaces are located, the total floor space is approximately 25,000 square feet, and will accommodate 80 workmen. Two cupolas—one of 25 tons and the other 5 tons capacity—are installed; the molten metal being distributed to the various sections of the shop by means of one and two ton ladles, travelling on monorails overhead. For the rapid production of the smaller castings, moulding machines are used exclusively; over 20 of these being in continuous operation. In order to meet the constantly increasing demand for certain brass castings, it has been necessary to augment the brass equipment, until at present 8 brass furnaces are operating for 23 hours each day, with an output of about three tons of metal.

Adjacent to the moulding shop is the

story fire-proof stone building, 60 x 40 feet, containing approximately 7,000 patterns.

#### Machine Shop and Wood Working Departments.

The main machine shop, three stories high, is 160 x 60 feet, with a total floor space of about 30,000 square feet. This shop is fully equipped for maintaining a maximum production of all sizes and types of machined hardware. In order to handle the large variety of work that

A CORNER OF THE MACHINE SHOP.

the speed and accuracy that is maintained in their production is truly remarkable.

In connection with the forging department is the grinding room, where the tools are edged, scale removed and otherwise shaped and polished. Twelve 6 ft. wet grind stones are used in this process. These stones, and all other grinders or dust producers, are fitted with exhaust system to carry off the dirt and dust.

#### Power Supply.

Power is supplied to the main machine shop and forging department by two 150 h.p. Crossley and Hunter gas engines, operated by producer gas. These engines are belt connected to the main shaft, and provision is made by means of two Dodge clutches, so that one or both sections of the shafting can be operated as desired. The hammer and axe department is operated by means of a rope drive of 100 h.p., the remaining 200 h.p. being used in the machine shop.

The entire plant is lighted from a unit in the engine room, there being 1,400 lights throughout the building. Cluster lights are fitted in the main machine shop. Throughout the plant are several electric elevators for facilitating the transfer of material from one department to another.

In addition to being connected, by siding, with the two leading railroads,

there is a wharf 450 feet long, which will accommodate vessels of 18 feet draft. During recent years, considerable land has been reclaimed by filling in the shallow portions of the river, ad-

#### CANADA FORGE CO.

THE plant of the Canada Forge is situated on the south-eastern outskirts of the town of Welland, and is favorably situated in regard to all of

GENERAL VIEW OF NO. 1 FORGE SHOWING HYDRAULIC PRESS EQUIPMENT AND WORK IN PROGRESS.

jacent to the company's property. The entire plant, while composed of many buildings, is very compact, and with the shipping facilities at hand and a plentiful supply of labor, the future progress of this industry is well assured.

the essentials required for the economical production and distribution of semi-manufactured steel product. As indicated by its name, the plant specializes in forgings, these being of the heaviest class such as are produced under hydrau-

HEATING A LARGE SHAFT IN THE FURNACE PREPARATORY TO FORGING INTO SHAPE.

lic presses and steam hammers, and dis-draulic pumping purposes now greatly tinct from drop forgings, which are the exceeds the amount of power derived special product of one of the affiliated from steam generators. plants. Although much of the original The location of Welland near the

Colborne, and Buffalo afford every opportunity for obtaining power, fuel, material and labor under the most favorable conditions.

#### Inception and Growth.

Since the year 1905, when the company was organised by T. J. Dillon, its growth has been steady and consistent. The year of its birth found Canada on the crest of a wave of prosperity, which despite the collapse in the neighbouring States two years later, did not abate until the slackening of world-wide industry in 1912-13 presaged the occurrence of present day events. This extended spell of activity during its early existence enabled a firm foundation to be laid which not only proved invaluable in withstanding the stress during early hostilities, but has caused the plant to become an integral part of Canada's industrial life with every indication of expanding beyond the confines of this land.

The main forge buildings which form the title illustration of this article, are of steel construction and arranged to provide a maximum of ventilation. Recent developments have called for extensive additions to the plant, one of which, shown in another illustration, has been laid out for the special purpose of facilitating the shipment of large quantities

of material now being produced.

The total area of the works is 4 acres, of which about two-thirds are covered by buildings, consisting of offices, machine shop, No. 1 forge, No. 2 forge, and shipping shed. Spur sidings from the Grand Trunk R. R. traverse the yards at suitable points.

#### Reception and Handling of Work.

Raw material in the shape of ingots, bars, etc., is received at the north end of No. 1 forge, the yard being served by

overhead travelling cranes, the track for which extends through No. 1 forge, across the next yard and on to the south wall of No. 2 forge. Three 15-ton Reliance electric cranes are mounted on the tracks, all of them having 5-ton auxiliary lifting tackle. In order to obtain maximum service from all, and avoid any one crane being idle because of its location, suitable equipment has been provided, so that each crane is equally adapted for work at any particular part of the shop.

Crane magnets are freely used, the type of apparatus adopted being that made by the Electric Controller and Construction Co. Another device consists of a Brown Hoist rotating attachment for use when a crane is serving the hammer

A 5-TON OVERHEAD ELECTRIC TRANSPORTER WHICH DELIVERS WORK TO THE LATHES IN MACHINE SHOP.

or forging press. This is an endless chain apparatus of heavy construction which is conveniently attached to any crane, the attachment carrying its own electric motor which pulls the chain around and turns the suspended forging

CONTINUOUS BILLET HEATING FURNACE. IN THE FOREGROUND IS A MOTOR-DRIVEN WATER CIRCULATING PUMP FOR COOLING PART OF THE STRUCTURE, AND ABOVE IT, TO THE LEFT, CAN BE SEEN A FEW LINKS OF THE ENDLESS CHAIN FOR DELIVERING HOT BILLETS.

in the desired manner. This apparatus can be distinguished in the photograph showing the steam hammer at work, another illustration showing the forging being heated in a furnace preparatory to hammering.

### No. 1 Forge Equipment.

With the exception of four hardening furnaces which are gas fired, all of the furnaces are heated by coal. These furnaces are designed and built by the company's engineers, the method of burning the fuel being by an underfed stoker with forced draft from fans. The forging equipment of No. 1 forge includes—1-2,000 lb. double frame Bement steam hammer, 1-1,500 lb. single frame Bertram steam hammer, 1-500 ton hydraulic forging press built by the Wm. Tod Co., and 3-350 ton and 5-200 ton forging presses. Separate furnaces are provided for heating the work for each hammer, press, or group of presses, the waste heat from three of the furnaces

LOADING SPECIAL FORGINGS IN RAILROAD CARS BY MEANS OF AN ELECTRO-MAGNET SUSPENDED FROM THE OVERHEAD CRANE.

adjustable ballast weights on the 12ft. stroke Wood accumulator, the press may

be operated at 3,000, 2,000, or 1,000 lbs. per sq. in. Forgings up to 30in. dia. can be handled in this press, the weight of the forging being limited only by the capacity of the handling appliances.

The remaining presses in No. 1 forge are operated by 4 sets of Deane 4in. by 12in. high pressure pumps, each driven by a 125 horse-power Crocker Wheeler motor running at 750 revs. per min. Individual Wood accumulators are provided for each set of pumps.

### Annealing Furnace Equipment.

A special feature of equipment is an annealing furnace with movable floor carried on trucks. This furnace, a photograph of which is reproduced, is particularly adapted for handling medium-sized forgings in quantity, and has proven particularly useful in treating shell blanks, piercing and drawing punches, etc., as the trucks are run out on the floor where loading can be rapidly done, at the same time allowing the furnace itself to be kept at a working heat. When filled up as shown, the trucks are

MOTOR-DRIVEN SHAFTING LATHE, 48 IN. SWING BY 36 FT. BED WITH MOTOR-DRIVEN CARRIAGE.

being utilized to generate steam for the hammers in 2 return tubular boilers built by E. Leonard and Sons. In addition to the overhead travelling cranes, conveniently situated jib cranes are provided for the steam hammers.

The 500 ton Tod press was specially installed for producing the highest class of forgings, such as crankshafts of all kinds, large connecting rods, locomotive forgings and axles for railroads and street cars, piston rods, gear blanks, and marine forgings. It exerts its maximum power under a working pressure of 3,000 lbs. per square in., supplied by a special three throw motor-driven Deane pump of the horizontal type, having plungers 1 9-16 in. dia. by 15 3/4 in. stroke driven by an 85 horse-power C.G.E. motor running at 500 revs per min. By means of

SEMI-FINISHED CRANK SHAFTS, PUNCHES AND DIES IN MAIN BAY OF MACHINE SHOP.

VIEW OF MACHINE SHOP SHOWING PART OF SHAFTING LATHE EQUIPMENT.

run right in, which enables a uniform heat to be given to all parts of the work, after which the trucks are either run out again and the work allowed to cool en masse, or it may be quenched in oil or left to cool down with the furnace according to the grade of material.

built with a slope down toward the middle of the furnace. Water-cooled rails facilitate the passage of the billets along the heating chamber, the pipe connections being plainly noticeable in one of the illustrations.

After travelling the length of the

EXTENSION IN COURSE OF ERECTION AT FORGE PLANT TO PROVIDE ADDITIONAL SHIPPING FACILITIES.

### No. 2 Forge.

This building has been specially equipped for the production of repetition work, such as shell parts and similar articles, and contains 2-500 and 2-300 ton Southwark forging presses operated by 4 Deane high pressure pumps each driven by Canadian Westinghouse motors of 250 horse-power, in conjunction with Wood accumulators.

Perhaps the most interesting feature is a continuous billet heating furnace, of which two views are reproduced. At the right hand of the general view is a Combustion Engineering Co. underfed stoker which supplies fuel, and at the opposite end is the continuous automatic charging gear which elevates the billets on a species of endless belt, and feeds them into the heating chamber which is

chamber, the billets have attained the necessary temperature and are deposited on a travelling chain placed transversely across the bottom of the furnace. This chain is endless and in constant motion, so as to avoid excessive heating, and as the billets fall on it, they are discharged

through a suitable opening in the opposite side where the forging presses are located. This furnace was installed complete by the Hare Engineering Co., and is an interesting example of modern metallurgical equipment.

In this department are also installed two National forging machines for the production of smaller articles such as shell sockets, nose pieces, etc. Each of these is driven by a 75 horse-power Canadian Westinghouse motor, and forms a complete unit with its own furnace equipment, etc.

ONE OF THE MOTOR-DRIVEN FORGING MACHINES.

All of the tracks are arranged so that the overhead cranes can be used for unloading the rough stock and conveying it direct to the various furnaces and hammers. After being forged much of the work is rough machined, and for this purpose a fully equipped machine shop 100ft. by 75ft. is provided.

### Machine Shop.

The forgings are transported to the various machines by a 5 ton Niles elec-

CANADIAN BILLINGS &amp; SPENCER PLANT WITH POWER HOUSE IN FOREGROUND AND FORGE DEPARTMENT BEHIND.

UPPER: A RIFLE BOLT IN DIFFERENT STAGES OF DROP FORGING. LOWER: DIES FOR FORGING SAME.

TYPICAL EXAMPLES OF THE DIE SINKER'S ART. NOTE THE DIES FOR SPANNER WRENCH AT RIGHT.

trie trolley on a system of overhead tracks. Preliminary work such as marking-off and centering is done on a table specially equipped for this work. The shaft is supported on roller brackets and an air drill is mounted at one end for drilling the centres. Before going into the lathes, such articles as crankshafts have the webs sawn out in cold sawing machines, which are also employed in roughing up die blocks for hammers, cutting large bars, and slabs, etc. Two such machines are in use, a Higley and a Newton, the former with a single saw for plain work, and the latter with a double saw for crankshaft work. Both tools are motor driven and use saws with inserted high speed steel teeth.

#### Lathe Equipment

The large lathe equipment consists of

representative machines by well known makers, including one 48 in. x 36 ft. Bertram shafting lathe, with 25 horse-

power motor drive, and individual motor drive on carriage for power traverse; one 36 in. x 42 ft. Bertram shafting

A LARGE ENGINE SHAFT FORGING BEING CENTERED ON THE ENDS ON A SPECIAL TABLE WITH AIR DRILL AT ONE END, PREPARATORY TO TURNING IN THE LATHE.

VIEW IN MACHINE SHOP WHERE DROP FORGINGS OF VARIOUS KINDS ARE MACHINED AND ASSEMBLED.

lathe; one 36 in. 30 ft. Pond shafting lathe; one 30 in. x 18 ft. Bridgeford lathe; one 30 in. x 18 ft. and one 28 in. x 10 ft. LeBlond heavy duty lathes, both

devoted to the heat treating of commercial forgings so as to secure the best service which the material in use can be made to give.

SAMPLES OF FORGINGS FOR VARIOUS PURPOSES PRODUCED ON DROP HAMMERS.

motor-driven by 15 horse-power motors. The medium lathe (18 in. to 24 in.) equipment is quite extensive, including many examples of Canadian and American makes, such as Bertram, C. M. C., Cisco, Hamilton, Sidney and Gleason, while other types of machines include one 6-ft. Niles radial drill, one 20 in. x 96 in. Norton grinder, with 30 horse-power Westinghouse motor; one Niles

TYPE OF BOARD HAMMER INSTALLED IN DROP FORGE DEPARTMENT.

slotter for crankshaft and similar work, and one London planer.

It will be evident that forging work, of almost any description and in any desired state of completion, can be produced in large quantities from such a plant. Equipment has been kept abreast of the latest and best practice, in which connection special attention has been

#### CANADIAN BILLINGS & SPENCER

As a branch of the original firm of Billings & Spencer at Hartford, Conn., the Canadian plant was very favorably placed with regard to such essential features of the work as equipment and experience. The demand for drop forged articles has been of steady growth, keeping pace with the manufacturing development of the country in many other lines. The advent of this plant in 1907 was timely, and its existence to-day has been of great value to many firms, whose increased output during the last two years has been largely dependent on the resources of this plant.

#### Equipment

Drop forging is a highly specialized branch of industry, and while much of its success is dependent on equipment and skill of operation, the initial factor of importance is the making of the dies.

The resourcefulness and accuracy displayed by die-sinkers, in fashioning huge blocks of metal so that spaces and hollows are provided in which the hot metal is formed to shape, is truly admirable, and the illustrations of die blocks and sample forgings will serve to convey to the reader a slight idea of the skill and labor which must be expended before even a simple form of article can be drop forged. The only limit to drop forging is the skill of the die-sinker.

The hammer department is equipped with both board and steam stamps. The board hammers or stamps are of the type illustrated, which is built by the company. In addition to marketing these hammers for 25 years, the constant use of them in their own shops has resulted in their being constantly improved until Model D represents the most modern tool of its kind. A 5,000 lb. steam drop hammer is a notable item in this department and extends the range of work very considerably. Bull-dozing and heading machinery is also installed.

Subsequent work involves annealing, pickling, and, in many of the staple lines produced, machinery also. The machinery shop equipment is arranged for the quantity production of wrenches, clamps, lathe dogs, thumb screws, turn-buckles, etc., and also includes several special machines for use in die-sinking.

Electric power for operating the various machines is purchased from local supply sources hence the power house requirements are limited to the supplying of steam for the hammers, pickling department, etc. With the exception of the mechanical stroker, the equipment including water tube boiler, feed water heater, etc., was supplied by Goldie & McCulloch Co.

A special trimming and grinding department is employed on finishing stock forgings preparatory to machining.

A DIE-SINKER AT WORK ON DIE BLOCKS FOR A COMPLICATED FORGING.

# Port of Vancouver Harbor Development: Present and Future

Contributed

*To insure the future position of the Port of Vancouver as the premier port of the Pacific Ocean is the avowed intention of the Harbor Commissioners of that city. Increased activity in shipping and shipbuilding, along with unequalled, natural advantages, insure the ultimate success of the plans described herewith. The extent of the work, and completeness of the arrangements indicate a firm resolve on the part of the authorities to assist as far as lies in their power in maintaining the supremacy of British world trade.*

**W**HETHER or not the plans of the Vancouver Harbor Commissioners will make the proposed port facilities self-supporting, the intention is to provide a sufficiently comprehensive scheme to make the harbor the equal of any port in America in point of convenience for handling freight, and the low cost of such freight handling and of the wharfage charges for goods transhipped between vessels and railway cars. There is another feature, and that is the providing of industrial sites with terminal rail and water facilities, and with it goes, in the terminal railway scheme, the common privilege of freedom to all railways seeking entrance to Vancouver harbor.

Plans so far gone on with by the harbor commissioners since taking office in 1913 have been the building of the Government wharf and elevator on Burrard Inlet, and the dredging of the channel in False Creek with the reclamation of a forty-acre area close to Granville Street bridge. The last item is almost completed now, and the deepening of the False Creek channel is fast nearing completion. When the announcement was made early in June by Mr. H. H. Stevens, M.P., that the harbor board was perfecting a somewhat ambitious scheme of harbor improvements, involving \$5,000,000, and projected to extend over a period of five to ten years in construction, widespread interest was taken by the business public generally. One objection only was taken, and that was the secrecy with which such a semi-public proposition had been carried out. The matter was there upon taken up with the members of the Board of Trade and a full and complete statement was given out.

## What Plans Include

Included in the programme laid down by the commissioners, and for which they have secured approval by Dominion Order-in-Council, is the terminal railway referred to, the purchase of certain waterfront properties on Burrard Inlet and of Kitsilano Indian reservation on False Creek. The full list of properties under negotiation at present is:

Kitsilano Indian Reserve, False Creek, 80 acres, estimated cost \$700,000.

Waterfront property at Port Moody, on Burrard Inlet, approximately 88

acres, with water frontage of half a mile, estimated cost \$550,000.

E. H. Heaps Co.'s mill property, Cedar Cove, Burrard Inlet, 16¾ acres, estimated cost \$650,000.

Wharf property of the Great Northern Railway Co. and the waterfront property immediately east of that property—estimated cost in all, \$1,800,000.

Right-of-way from the Kitsilano Reserve to the Heaps property, estimated to cost \$1,552,861.25.

Portion of right-of-way of Pacific Great Eastern, estimated cost \$516,267.

The total estimated cost of properties thus to be acquired is set at \$5,769,128.25. The harbor commissioners anticipate being able to exchange properties in the waterfront now in their possession for some of these parcels they wish to secure, thus reducing the outlay cost to the board by \$2,448,833.50. That would leave a balance of \$3,320,294.75. The commission proposes to float a Government-guaranteed bond issue of \$5,000,000 for the purpose of acquiring the properties and of putting in the improvements planned. The net cost estimated above, together with the \$200,000 bond issue already made, and which it is proposed to retire by way of consolidating the bonded debt in the one issue, will leave \$1,479,705.50 available for harbor improvements and terminal facilities.

The proposed terminal railway begins at Kitsilano Reserve, extends on the south side of False Creek to Glen Drive east of Main Street, thence to Harris Street, and thence to the Great Northern wharf. The proposed route takes in the existing B. C. E. R. transfer track on the south side of False Creek. The entire distance is 4.84 miles, the actual feet measurement, according to the plans, being from point to point, as shown on the sketch plan prepared by the harbor engineer, being:

	Feet.
Kitsilano Reserve to Granville Street bridge .....	1,540
Granville to Connaught bridge .....	5,835
Connaught to Main Street bridge .....	3,580
Main Street to Glen Drive .....	4,860
Glen Drive to Harris Street .....	3,710
Harris Street to Great Northern dock ..	2,025
Great Northern dock to Dominion dock ..	3,990

It is the plan of the harbor commissioners to build large ocean docks at Kitsilano Reserve on English Bay. In this connection it is interesting to note that when the C. P. R. first built into Vancouver it secured a charter for what

is still officially known as the English Bay branch, and which extends from English Bay Junction at the Burrard Inlet end of Columbia Street, through the False Creek yards and by way of Kitsilano railway bridge to the Kitsilano waterfront. The old railway bridge, rebuilt when the line to Steveston was constructed, long hung a disused wreck, falling to pieces over the entrance to False Creek. It had never been used for much more than to secure the standing of the charter for the English Bay branch. The intention of this branch was to connect with ocean docks projected to be built on the Kitsilano waterfront. Early maps of the city show the four piers which were planned to be built in connection with this dock scheme.

Another part of the proposed improvements on Kitsilano Reserve has to do with furnishing industrial sites. Speaking on this subject on June 20, Mr. Stevens, M.P., stated:

"Now, as regards the Kitsilano Reserve, make no mistake. The board is in possession of that reserve and we are going to arbitrate the matter. But you can get this very clear. We are going to build ocean docks there to handle ocean steamers and place industrial sites, and we are going to have our own railroad to connect those sites with our Government dock on Burrard Inlet."

The Port Moody portion of the commissioners' scheme was to provide that class of wharfage which was bound to be needed for the handling of bulk cargoes. All parts of the proposed improvements had been closely discussed and studied, declared Mr. H. H. Stevens, when in conference with the Board of Trade committee on June 23. "Each unit in this scheme," he said, "has been investigated, and we are satisfied that the units will be self-sustaining without any charge on shipping."

## False Creek Improvements

With respect to the forty-acre reclaimed area on False Creek at Granville Street bridge, when complaints were made at the Board of Trade conference, that the spoil filled in behind the bulkheads had silted out into the channel, it was pointed out that the bulk-heading is fifty feet back from the head line as planned, so that there is plenty of allowance made for any working out of the spoil from the fill. It was

the intention to let the sand slope out to the property line, as people leasing sites on the reclaimed area would wish to build wharves to suit themselves.

The channel now nearing completion in False Creek is 350 feet wide, and it is the intention to have it 22 feet deep from English Bay right up to Main Street, where the proposed retaining wall is to be put in. This makes it available for many craft of considerable size which have not heretofore been able to make use of it. The spoil from the upper portion of False Creek dredging work has been deposited in the big fill made by the Canadian Northern at the head of False Creek, under the contract made with the City of Vancouver. That from the section of the creek nearer English Bay has been made use of to make the fill at Granville Street.

#### Time and Cost of Construction

To carry out the proposed improvements, the terms of the Order-in-Council approving it, fix five years as the minimum time in which the work shall be done, and that it might be ten years before it was entirely completed. Seattle is spending \$6,000,000 on harbor improvements. That Vancouver will have developed and advanced sufficiently in five years to warrant all the expenditure proposed by the Harbor Board is the argument put forth. The terminal railway is held to be one of the necessities of the port. That the Dominion cabinet approved of the plans of the commissioners is clearly shown. That they took every reasonable precaution and safeguard to protect the interests of those using the port is also easily established. The Order-in-Council reads in part, speaking of the conditions on which the \$5,000,000 of bonds are to be secured, that they are to be used in "the gradual development extending for a period of five years of such items in the programme as in the judgment of the commissioners, with the approval of the Minister of Marine and Fisheries, promise to become immediately revenue producing, with the further condition that the plans, specifications and estimates of all work for the development of the above property or with the provision of other facilities shall receive the approval of the Minister of Marine and Fisheries before any work is started or expenditure on the same is incurred."

The entire cost of those harbor and wharf improvements so far carried out in Vancouver has been borne by the Dominion Government. These are the False Creek dredging referred to, the dredging at the entrance to Burrard Inlet, which has been carried on for over two years, and the Government dock and grain elevator on the main harbor front.

The question of harbor improvements has long been a live issue in Vancouver, and the opinion has always been ex-

pressed generally among those informed on the subject, that the Dominion Government had the chief responsibility in the matter, as ports on the eastern seaboard of Canada had been improved at large expense undertaken by the Dominion. In comparison with Vancouver, the work done at the port of Montreal is frequently referred to. The development of that port commenced on January 13, 1898, when the Dominion Government advanced \$2,000,000 at 3 per cent. On May 23, 1901, another \$1,000,000 was voted. On July 10, 1903, \$3,000,000 was advanced, and on July 13, 1906, a further grant of \$250,000 was issued to redeem debentures issued in 1876.

On April 27, 1907, another loan of \$3,000,000 was made, and on May 4, 1910, no less than \$6,000,000 were voted at 3½ per cent. to retire 100,000 debentures maturing in 1910.

On March 12, 1912, another \$6,000,000 at 3½ per cent. was voted to retire debentures of the par value of \$600,000 maturing at the rate of \$200,000 per annum in each of the years 1913, 1914, 1915.

This money was lent by the Dominion Government to the port of Montreal and all the port is required to pay is the interest. In the case of Vancouver, the Government would have followed the same policy had it not been for the war, but the Commissioners state that after the war, they have the assurance of the Government to stand behind the terminal scheme.

The operation of the railway terminals has proved to be one of the most important and successful features of the development of Montreal harbor. On the north bank of the St. Lawrence River, adjoining the cities of Montreal and Maisonneuve in their most congested industrial districts, the harbor railway terminals extend. The total distance, measured along the river bank, is seven miles, but the total mileage of tracks is 44.9.

#### Existing Wharf Accommodation

Owing to present conditions in shipping, with very little freight arriving from the United Kingdom as in years preceding the war, there is no lack of shed accommodation on the docks now in existence, and no danger of congestion such as frequently occurred in the active years of expansion in 1912 and 1913. Storage space on the docks available for in and outbound cargo is covered by Evans, Coleman & Evans' dock with two piers, one 650 feet long and 100 feet wide, the other 810 feet long and 75 feet wide; Johnson dock with a shed 600 feet long; Balfour, Guthrie & Co. dock with shed 400 feet long and 100 feet wide; Great Northern dock with a shed the same size; C.P.R. docks with some ten sheds in all, of varying dimensions; Dominion Government dock

with two sheds 800 feet by 80 feet.

Quite recently the Canadian Pacific Railway Company let the contract for the construction of another pier for ocean vessels at their docks. Additional shed space will be provided when this pier is built.

Harbor dues have yet to be agreed upon in respect of charges made by the Board of Harbor Commissioners. That body drafted by-laws including a tonnage tax of 3 cents per ton and the by-laws were approved by Dominion Order-in-Council in 1914. Opposition by the Vancouver Board of Trade, however, has prevented action being taken so far to enforce the collection of the proposed tax. Other port charges now in force and which are compulsory, consist of pilotage in and out, sick mariners' dues and bill of health. Pilotage charges are \$1 a foot draft of vessel and 1 cent per ton. Sick mariners' dues are 1½ cents a net ton. British bill of health costs \$1, and the American bill of health, if a vessel clears for that port, \$5. On an average vessel of 3,000 tons the pilotage charges in and out would be \$104 and with the sick mariners' dues and bills of health the total cost at present is \$150. When the harbor commissioner's tax of 3 cents per ton is imposed an additional \$90 would be charged. The charge, however, it is pointed out, would not be collected on more than five entries in any one calendar year, so that vessels plying in regular service would not have to add that amount to their dues every trip they made.

Comparison with Seattle port charges shows that in addition to pilotage, and other items there is a federal tonnage tax of 6 cents, which is just double that proposed by the Vancouver harbor commissioners. The cost to a 3,000-ton vessel entering and clearing from Seattle would be \$288, so that even if the 3-cent tonnage tax were imposed in the port of Vancouver the total dues on a vessel would still be less than in the Sound port.

#### INCREASE IN ONTARIO METALS OUTPUT

RETURNS of production for the first six months of 1916, made to the Ontario Bureau of Mines by the metalliferous mines and works of the province are summarized in the accompanying table, which also gives comparative quantities and values for the corresponding period of 1915.

The production for the six months ending June 30, 1916, shows a material increase in value of all metals over that for the first six months of 1915, with the single exception of iron ore.

#### Gold

If the present rate of production is maintained, Ontario should reach the

\$10,000,000 mark for 1916, as compared with \$8,500,000 for 1915. Of the total yield the Porcupine camp contributed all with the exception of \$545,434, produced by the Groesus, in Munro township, the Rognon, near Dryden, the Tough-Oakes at Kirkland Lake, and the Canadian Exploration Company at Long Lake, near Sudbury. The Hollinger Consolidated and Dome Mines are the big producers of the Porcupine camp. Before the year is out Boston Creek will probably be contributed to Ontario's gold production. Development is proceeding on some of the more promising claims at Kowkash, situated east of Lake Nipigon, on the Transcontinental Railway.

### Silver

Since the beginning of 1916 the price of silver has advanced considerably, the average being 62½¢ per ounce, low 56½¢ and high 77¼¢. As a result, production has been stimulated, and the value as compared with 1915 figures shows a considerable increase. Although the ounces sold were less than for the corresponding six months' period of 1915, the total production was greater, over 1,000,000 ounces remaining to be marketed. Undoubtedly the life of the Cobalt camp will be prolonged as a result of introducing flotation treatment for handling low-grade dumps and slimes. Nipissing still leads in output with a valuation of \$1,766,561. The Mining Corporation of Canada (Cobalt Lake and Townsite City) is the next large producer followed by Kerr Lake, Coniagas, McKinley-Darragh-Savage, Seneca-Superior, etc., in the order named.

### Cobalt

With the outbreak of war the European market for Cobalt oxide was suddenly cut off. However, new markets and new uses for metallic cobalt have improved the situation. High-grade steels are now produced from cobalt alloys. Metallic cobalt production is greatly in excess of last year.

### Nickel

Metallurgical nickel from cobalt ores is produced at the refining works of the Deloro Smelting and Reduction Company, Limited, formerly known as the Deloro Mining and Reduction Company. The output shows an increase over the 1915 production, which was not marketed during the six months' period.

### Copper

Apart from the nickel-copper deposits of Sudbury, there has been a revival of copper ore mining in Ontario, partly due to the high price of the metal. The old Tip-Top mine and other properties near Mine Centre, in the district of Rainy River, are now producing. The Rand Syndicate is operating near Timagami. The Sable River Copper Company, at Massey has erected a mill and is using

the flotation process for the treatment of copper ore.

### Nickel-Copper Matte

The smelters of the Canadian Copper Company, at Copper Cliff, and the Mond Nickel Company, at Coniston, are turning out nickel-copper matte at an unprecedented rate. The production, as compared with the first six months of 1915, shows an increase of nearly 40 per cent. The valuation of the metallic contents of the matte has been made on a basis of 10 cents per pound for copper and 25 cents for nickel. The figures given for metallic copper and nickel separately show that the prices were over 18 and 42 cents per pound, respectively.

In addition to the above-mentioned companies, the Alexo mine, near Porquis Junction, produces a small amount of nickel-copper ore, which is treated at the Coniston smelter.

### Molybdenite

This mineral occurs widely in Ontario, but is mined chiefly in Renfrew county. It is wanted at the present time for use in the manufacture of high-speed tool steel, and for this purpose molybdenum will probably replace tungsten to some extent. The demand for molybdenum steel, to be used in munition factories, comes largely from the allied nations, Britain, France, and Russia. Molybdenite concentrates, containing 85 per cent. for more of Mo. S. 2, are worth about one dollar per pound. Ferro-molybdenum is now (September) being manufactured for the first time in Canada by the Orillia Molybdenum Company, at Orillia, and the Tivani Electric Steel Company at Belleville.

### Iron Ore and Pig Iron

The only shipments of iron ore were from the Magpie mine, operated by the Algoma Steel Corporation of Sault Ste. Marie. Although iron ore production shows a decrease as compared with the same period in 1915, that of pig iron shows a material increase, both in tonnage and value.

## CANADA'S GOLD OUTPUT

THE total production of gold in Canada in 1915 is estimated by the Canadian Department of Mines at 916,976 fine ounces valued at \$18,936,971, as compared with 773,178 fine ounces valued at \$15,983,607 in 1914, an increase of \$2,953,364, or 18.5 per cent. Although the production has more than doubled since 1907, it has not yet reached the high mark attained during Klondike's best years. The 1915 output was exceeded during each of the four years from 1899 to 1902.

Of the total production in 1915, about \$5,550,987 was derived from placer and alluvial mining, \$9,195,307 in bullion and refined gold and \$4,230,677 contained in

matte, blister, copper, residues and ores exported. Ontario has now become the largest gold-producing province in Canada, the production in 1915 from fifteen properties being reported as \$8,386,956, or 44 per cent. of the total production in Canada, as against against a production in 1914 of \$5,545,509, an increase of \$2,842,447, or 50 per cent.

## THE FOREST WEALTH OF QUEBEC.

FEW people, even among those living in the neighborhood of Canadian forests, have anything like a true conception of the vastness of Canada's wooded areas and timber wealth. The regions contiguous to the Eastern Townships of Quebec constitute a locality of increasing interest at a time like the present when lumber prices incessantly increase.

Rivers and railway lines penetrate the forests beyond the boundaries of the Eastern Townships so that the raw material is very conveniently transported to the mills. Large numbers of men are given employment and prosperity is evident in the comfortable homes of the populace.

The principal soft woods growing in the Eastern Townships are pine and poplar. The hard woods are maple, birch, beech, ash and elm. Almost every farm has its cordwood stock and sugar bush with some timber to spare for special building purposes or export.

Several large lumber firms have their head offices in Sherbrooke. From here they direct their operations which extend to all parts of the province. These concerns operate both on their own freehold hold properties and also on leased Crown lands. Last year the Quebec Government had over 70,000 square miles of timber limits under license. The production of lumber from one section of these limits amounted to 736,790,594 feet, board measure. In addition there was marketed 345,206 cords of pulpwood, 44,000 posts and rails, 109,000 pickets, 608,429 railway ties, 3,808 cords of firewood, 9,278 poles, and 109,406 cubic feet of square timber. The government revenue from Crown land licenses reached the sum of \$1,126,907, all of which shows the great wealth and possibilities of a limited but important section of the province.

RECENT returns show a considerable revival of export trade as regards sewing machines for countries in Europe, South American, and Australia, and textile machinery is being shipped to France, China, South America, the East Indies, Japan, the Netherlands and Russia. Makers of typewriters have no reason to complain of their export trade with countries in Europe, South America, India, the Straits Settlements and Australia.

# Some Important Factors in the Conduct of Export Business

By E. V. Pannell

*Apart from a broad knowledge of foreign markets, a no less essential requisite, for the successful conduct of export business, is an intimate knowledge of the various factors directly affecting the efforts of exporters. Where, what and how, are three aspects of the case which require continual investigation to insure a consistent growth of our country's foreign trade.*

**A**T the cessation of the European war many hundreds of factories, now working upon war material, will be condemned either to idleness or to the production of implements and machinery for the arts of peace. It will be the desire of every Canadian manufacturer to take a share in and increase the export trade of the Dominion. The South American, Australian, Japanese and Russian markets will be expected to afford openings for new business connections where none before existed, and this will prove to be Canada's opportunity. Europe will, of necessity, be occupied to a great extent in rehabilitating and equipping the countries devastated by the war; whilst the United States manufacturers may be expected as ever to devote the major part of their outputs to the demands of their highly protected home market.

## Points to Investigate

A manufacturing concern, which has always been engaged in filling domestic demands, is sometimes reluctant to embark upon export trade from mere conservatism, thereby passing up much profitable business. In any event, it will be of value to appoint from the Sales Department a commission to investigate the opportunities of business in a foreign market. The most important points to investigate are: (a) Demand; (b) import duties; (c) freight rates; (d) system of credit; (e) foreign exchange.

## Demand

First and most important is the demand for the goods. Is our friend the Canadian manufacturer supplying a commodity of equal value to that already obtainable in the foreign country at a lower cost, or some new appliance hitherto unknown there, the demand for which can be created? In either case trade may be anticipated. The Dominion Government has stationed in fourteen different countries trade commissioners and agents. The duty of these officials is to report upon the opportunities in the respective countries for Canadian export business. In addition, the British Consular service affords a valuable means of obtaining information regarding the possibilities of a new market. Private correspondents are also a means towards the same end, but it is doubtful whether any of these methods can be compared with the personal investiga-

tion of travelling to the country and studying the requirements on the spot.

## Tariffs

Tariffs are sometimes referred to as being prohibitive; in other words, as excluding the purchase of any imported goods. This is, however, very seldom the case. Where a high tariff is in force the home producer will regulate his prices in line with the import duties, and the prices paid by the ultimate consumer will be very little different whether for domestic or foreign supplies. A close study of the tariffs is, however, very necessary as a preliminary to export business, mainly to ascertain the correct classification for the goods. For instance, in many countries a lower tariff is in force for agricultural machinery than for other classes of machines; it will readily be seen that there is liable to be some ambiguity unless the goods are properly declared.

## Freight Rates

Ocean freight rates are usually quoted in shillings or dollars per ton of 2,240 lbs., or 40 cubic feet. As a rule, for most types of cargo the measurement

DIAGRAM ILLUSTRATING REMARKS ON EXCHANGE.

rate applies, so it is important to bulk the cargo down into reasonably small cases. At the present time rates are away up, due to the scarcity of and unprecedented demand for tonnage, but with the large number of vessels which will be released at the end of the war, freights will reach a more favorable level. The law of supply and demand causes fluctuations in the freight market in normal times, and not the least important function of the exporter's office is securing freights at the most favorable turn of the market.

## Credit Systems

Terms of payment for export shipments usually favor the exporter, being cash against shipping documents at the place of shipment. For instance, in the case of a lot of machinery consigned to Bordeaux the original bill of lading will be obtained from the shipping company and attached to the triplicate Consular invoice duly certified by the French Consul and the certificate of insurance. These documents being presented at the purchaser's agents in Toronto, the cash is paid over in full. Where no such agent exists, the purchaser will make a deposit with a Toronto bank for the amount to be handed over in exchange for the order bill of lading duly endorsed. Certain machinery manufacturers specify the terms "50 per cent. with order and 50 per cent. on shipment" as applying to all export business, whilst others are content to wait for a portion of the purchase price until the goods have been delivered and erected. Far more latitude in credits must be allowed if an energetic nation-wide export trade is to be stimulated. The secret of German commercial success in the South American market lies in the long credits which the exporters, with the help of their banks, were able to give.

## Influence of Exchange

The prevailing rate of exchange plays an important part in stimulating or depressing the export trade. It must be remembered that the foreign customer always figures the cost of the goods in his own currency, whereas the exporter's price will be based upon the Canadian dollar. If, therefore, the dollar commands a premium in terms of sterling, francs, lira, or whatever it may be, the cost of goods would be higher to the importer and trade will be discouraged. Take the case of exchange upon London, of which the normal or par rate is \$4.86 2-3 to the £, the value to-day is only about \$4.75, so that other things being equal, Canadian goods cost the English importer 2½ per cent. more than under normal conditions. This is, of course, a reaction from the heavy demand for American and Canadian goods, causing a very large number of drafts on London, which operates to the detriment of the sterling exchange. The diagram illustrates the manner in which

export trade reacts upon the foreign exchange. The Canadian exporter A ships goods to a customer in England B, and, presenting his draft at a Toronto bank acting for B, draws cash. In the meantime, B has paid cash into his local bank with instructions to liquidate A's draft in Toronto. So the net result is that A sells the goods and gets cash, whilst B buys the goods and pays cash. The rest is up to the banks. If this were only a one-sided process, the Toronto banks would soon become loaded up with drafts on London and depleted of their cash, whilst the London banks would be in just the opposite state.

### Imports Must be Considered

But it must be remembered that import trade as well as the export has to be financed. C is a Canadian importer buying goods from England and paying cash in Toronto. In this way the local bank is both receiving and paying cash on account of goods bought and sold, and at the same time accumulating drafts on London. In the same way the London bank is accumulating drafts on Toronto without disturbing the cash balance. The drafts are handled by bill brokers, and are ultimately exchanged and cancelled. Now it will be seen from the foregoing that any great disparity between the value of exports and imports will disturb the cash distribution. An abnormally high export trade from Canada to England will result in an abnormally large number of drafts upon London. Balance can be restored only by stimulation of the Canadian import trade or by the shipment of bullion from England. This latter course is never resorted to until other methods have failed. Such methods, adopted by the Bank of England, comprise increase in the rate of discount at which foreign drafts are accepted; in other words, raising the bank rate. Drafts or bills upon London being plentiful at the present time is another way of saying that the pound sterling is cheap in terms of foreign currency, hence the low rate of exchange.

Empire wide commercial relations could be greatly fostered by a more unified system of chartered banks giving better facilities for exporter and importer.

### BRITAIN'S EXPORT TRADE IN JULY

THE vital importance of Britain's commerce as a means of sustaining the Empire in the present crisis is fully recognized by her overseas Dominions, all of which are emulating to good purpose the example set by the Mother Country. In an analysis on the official figures relating to exports and imports of the United Kingdom in July last, the British Trade Review makes interesting com-

ment on present commercial activity between Britain and her colonies, as well as with other countries, the possibilities of further markets for Canadian products being apparent in many cases where supplies formerly obtained from the Central Powers are no longer available. The returns should also lead enemy countries to think and to realize the hopelessness of a struggle with a Power whose credit and supplies will outlast unprecedented periods of warfare, and which can, if it be necessary, renew and carry on war again and again throughout the twentieth as easily as throughout the eighteenth century.

### Exports Show Increasing Value

During the month under notice, despite the absence of five million men with the colors, exports were valued at £54,210,000, a value even greater than that of July, 1914, when no war existed, and some £11,000,000 greater than the export values of July a year ago. During July last there were exported larger quantities of beer, ale, spirits, wrought copper, cotton yarn, worsted yarn, wollen tissues, woollen carpets, and linen yarn and piece goods than in July, 1915. In these commodities quantities have increased as well as values. In coal and fuel, iron and steel, cutlery and hardware, machinery, cotton yarn, piece goods, and other cotton manufactures, woollen yarn, jute piece goods, silk goods, clothing, boots and shoes, and china and earthenware, greater values were exported compared with July, 1915.

### Enemy Trade of Little Significance

The total British exports were valued at £46,323,000; but to these must be added the transshipment trade in foreign and colonial goods, which is being carried on to the value of nearly £8,000,000 per month, and in connection with which the loss of enemy countries' trade has been more than made up by increased business with neutrals and Allies being in July last greater than in July immediately before the war. This tends to show that Britain is already independent of the trade with enemy countries; that she is doing very well without it; and that, so far as her international commerce is concerned, she could continue the blockade of enemy countries for generations without any serious loss on balance to her international position.

### Details Disclose Demand

An examination of the details of the returns throws some interesting light on exports in war time. The increase in the shipments of beer, ale, and spirits is, to a large extent, accounted for by the large number of British troops abroad, but increased supplies went also to the United States. Preparations of cocoa are being sent more largely to Australia,

and the export trade in biscuits has returned almost to the 1914 position, excepting as regards South Africa. There is an increase in the quantities of British spirits shipped to the United States, South Africa, the British West Indies, Australia, and New Zealand. Tobacco is also sent abroad more freely, the quantities of cigarettes being for the seven months about double those exported in the same period of 1914. While the total shipments of coal have fallen off, larger quantities have been sent to France, Norway, Portugal, West Africa and Gibraltar. Oil seed exports show a steady decline, for the satisfactory reason that the oil-crushing industry has been developed at home. Of hides and undressed skins the United States have taken for the seven months about double the quantity of 1915, and more have also gone to Canada.

### Machinery and Metal Products.

Of pig iron there was exported so far in 1916 about as much as in 1914, France and Italy taking largely increased supplies. Wrought iron exports are also as high as two years ago. China, South Africa, the Argentine, the East Indies, Japan, Australia, New Zealand, and Chile buying freely. Wire is going more largely to the East Indies, and wire manufactures to South Africa, the East Indies, and Australia. Bridge, boiler, and other iron and steel plates, are in great demand for France and Japan, and black sheets for France and Australia. The exports of galvanized sheets show a marked decline all round; but tinned plates are being shipped more largely to France, Portugal, China and Australia. In nails and rivets, tubes and pipes, anchors and cables the quantities exported are well maintained; while in steel bars and angles the shipments have risen from 127,000 tons in the seven months of 1914 to 406,000 tons in the same period of the present year, the principal buyer being France, which took more than 75 per cent. of these exports. France and the United States have between them been taking more than half of Britain's unwrought tin exports.

### Colonial Prosperity

The prosperity of Australia, New Zealand and South Africa is reflected in the cutlery and hardware exports; and now that German competition is eliminated more demand is made for these commodities in Cuba, Chile, Brazil, the Argentine, as well as in the British Dominions. In carbons and electric glow lamps there is a most satisfactory export trade, due to the absence of the Central Powers from the market. France, Russia, Spain, India, Ceylon, and Australia continue to take fairly large quantities of general machinery, and South Africa has increased its purchases of mining machinery.

### PRACTICAL GOVERNMENT ASSISTANCE TO MANUFACTURERS

**I**N the immediate future, thanks to arrangements made recently in England by Right Honorable Sir George E. Foster, Minister of Trade and Commerce, there will be exhibited in this country a collection of more than 8,000 samples of goods of German and Austrian manufacture.

The work of getting these together has been carried out by British Consuls and Trade Commissioners in some seventy different markets all over the world and are being sent to this country with the special object of showing manufacturers here what lines are available for the application of their manufacturing resources.

The goods are divided into eight classes, and include textiles, hard and soft haberdashery, fancy and leather goods, glassware and crockery, general hardware, tools, and miscellaneous. Many of the lines shown in the hardware and tools' sections are not readily adaptable to production in plants at present operating on shells, and because of this feature, the display may not be immediately productive in regard to certain goods. The two sections named, however, include many articles, the manufacture of which is already established here, viz., enamel and aluminum ware, nails and screws, brass taps and fittings, stocks and dies,—horse-clippers, pliers, machinists' tools, electrical fittings, cutlery, etc.,—are a few of articles whose production can be immediately extended.

Lest any Canadian firms should feel diffident as to altering designs or patterns in order to duplicate samples, it is of interest to note that manufacturers who attended the exhibition in the United Kingdom were asked to make a detailed list of their own existing product which could be used to replace the enemy goods. It is understood that a similar course will be followed in this country, and an excellent opportunity will thus be available for setting forth the merits of many distinctively Canadian articles.

The action of the Department of Trade and Commerce cannot be too highly commended and the fact that they are sending out admission tickets to firms who wish their

foremen and expert employees to inspect the goods is in itself evidence of the far-reaching influence which the event is expected to have on Canadian industry.

### DEVELOPING PRESENT HELP

**T**HE desirability of formulating a definite educative policy for engineering employees becomes more apparent with the increasing scarcity of labor and if all expectations regarding coming competition in the world's markets are realized, the value of intelligent and adaptable help will be still more appreciated. Firms whose first appearance has been in the munitions business may, as a result of a certain measure of success, feel that if they can make shells, they can make anything. For these, when they enter the transition period, there may be a rude and expensive awakening.

Many of these plants are 75 per cent. manned by illiterate help whose visible signs of intelligence are limited to the turning of a hand wheel in one direction till it stops, and then in the opposite direction. Most of them are men past the age where knowledge is eagerly assimilated because of its possible future value, and once having learned a simple part of the work, are not anxious to trouble about a wider field for their labors. The handicap under which a plant will work with help like that, will be very great when long-continued repetitive work like shell-making is discarded, and a more general and varied product is called for.

Now is the time when relations with help must be strengthened with a frank interestedness and open-mindedness which will convince the workman that a continuance of present prosperity into the future, let alone a moderation of it, will be in great part dependent on his adaptability and skill.

Where men have only taken machine shop jobs for the money, no beneficial results can be looked for, but where men, young or old, show mechanical instinct of any degree, they should be encouraged by every means possible to develop their mind along mechanical lines so that in days to come, the prosperity of the country and themselves will not suffer from lack of technical training and ability. No one can influence them more than their employers, and no time is more opportune than the present.

### COST OF PAPER IN CANADA

**T**HE present anomalous state of the paper trade in Canada is practically without precedent. Although the increased cost of paper in this country is due to the high cost of labor, the fact remains that Canadian mills are exporting about 2,000 tons of paper daily as against less than 1,000 during the same time in 1914.

The great increase in the amount of paper going out of the country at the present high prices emphasizes the reasonableness of the claim of Canadian publishers for fair treatment from paper manufacturers. The tendency of some foreign manufacturers, especially in the steel and iron industry, to maintain separate home and foreign prices has acted prejudicially in the case of Canadian firms competing with similar United States concerns, and the adoption of a similar policy in regard to Canadian paper is, we believe, worthy of the support of shareholders in Canadian paper mill securities.

## INDUSTRIAL NOTABILITIES

**W**ILLIAM MICHAEL WEIR, President, Canadian Foundries & Forgings Ltd.; Vice-President, J. A. Mackay & Co., Ltd., Investment Securities, Montreal, and Director, Aterias Wharf and Warehousing Co., Havana, Cuba, was born in Quebec, July 26, 1873, the son of William E. and Mary A. (McGoldrick) Weir.

After having been educated at Ottawa University, Mr. Weir, in 1895, was appointed Assistant Secretary-Treasurer, Ottawa Electric Co., Ottawa, holding this position till 1901, since when his activities have been mainly in the finan-

WILLIAM MICHAEL WEIR.

cial field, being respectively Bond Salesman, E. H. Gay & Co., of Boston and Montreal, 1901-1906; Canadian Manager of E. H. Gay & Co., at Montreal, 1907-1909; formed partnership with J. A. Mackay, 1909; business incorporated as J. A. Mackay & Co., Ltd., when he became Vice-President, 1910.

Mr. Weir married Florence E. Neville, November 25, 1903, his family consisting of two sons and five daughters. He holds a Captaincy in the 55th Irish Canadian Rangers and is a member of the following clubs: Royal St. Lawrence Yacht; Garrison (Quebec); Brockville; Welland; Kanawaki.

Yachting and golfing are his principal recreations while he is Roman Catholic in religion. Mr. Weir resides at 58 Aberdeen Ave., Westmount, Quebec.

## THE ENGINEER OF TO-DAY

By N. G. Near.

**I**MAGINE, if you can, a lawyer who does not subscribe for a law paper, or who has no law books in his office. He would be a "poor excuse" for a lawyer, indeed. It would soon become evident to everybody who knew him that he was not up-to-date. He could not work long on the knowledge he had gained while at college, or that he had gained in some other office. I know of no such lawyer. I doubt if there is one, especially one that could truthfully be "called" a lawyer.

Again, imagine a doctor who refused to subscribe for a doctor's journal. He may be a graduate of the best known medical school in the world, yet, if he lays down flat after finishing his course and refuses to learn more, it would not be long and he would be properly termed a "back number." The function of the medical journals, like the engineering

FIG. 26.

journals, is to keep its readers informed along the lines of latest practice. "Kinks" are to be found in medical papers just as in our papers. The journal is the proper channel for up-to-date news. The book and the library are for reference to precedence and good practice in days gone by. Journals and books are indispensable.

The same may be said for the teacher. Teachers of any profession should be intensely up-to-date. It is impossible for them to do too much reading and studying.

Contractors, architects, concrete specialists, textile men, coal miners, machinists—every trade worker, in fact—should subscribe for some paper or other in his field in order to keep from dragging along behind the times. The paper subscribed for and read should be the best. The best paper is the one that is not too high above the reader's head and that is not so elementary as to teach nothing new—the paper must be alive to the present.

The engineering profession is just as important as any of the above. There are more "new things" in engineering than in other lines, and therefore more to read about. The steam turbine, for example, has made enormous strides. Inventions of engineers make possible such highly developed sensations as the aeroplanes which loop the loop and fly circles around birds, the submarine, the battleship, enormous guns, the automobile, the steam railroad, and all electrical contrivances. All of these great things have been achieved since Watt made coal usable in the form of power. Power has therefore been the greatest civilizing agency and is now more important than ever.

Every engineer, no matter what his position, should read. Keep up with the times. Don't be a man of yesterday, last week, last year, or last generation. Read!

Then apply what you have learend.

## MACHINISTS' INSTRUCTION COURSE—V.

WHEN a hole is too large to be finished with a drill, it is either dulled first, or the hole is cored out in the foundry and is then finished with a boring bar, so that boring may be said to be the finishing of hole that has been previously made. This is done by a bar carrying one or more cutters. There is a great variety of boring bars and cutters, but the practical method of operation is much the same in all cases.

### Regarding Boring Bars

Use a boring bar as large in diameter as the cored or drilled hole will permit, and as short as is consistent with the depth of hole to be bored, leaving a good length of bearing in the guid-

ing or supporting bush when the cutter commences to cut. See that the tang at the end of the boring bar fits the drill spindle, and in large bars it is well to have a small hole right through the end of the drill spindle and the taper shank of the boring bar, so that a pin driven

FIG. 27.

in this hole supports the weight of the bar. A boring bar is much more likely to come loose in the drill spindle than a drill, so that some such device is necessary. Some people use a set screw, but this is unsatisfactory and dangerous unless a safety set screw is used.

Be sure that the bar is a good fit in the table bushing, an easy, free fit, yet not slack. This is very important, as it is impossible to do a good job if the end of the bar is allowed to wobble. In setting up the job, see that the bar will enter the table bushing without being deflected to one side. Set your table first, that is if the job will permit you doing so, with the bar free to move round and up and down in the bush. It might not be possible to set up some jobs this way because the bar could not be raised high enough to pass over the job underneath. In these circumstances place the job on the table first, then pass the boring bar through the job into the table bushing, and swing the whole arrangement under the drill spindle together.

### Keeping Cuttings Clean

Cut out a large leather or rubber washer and press it tightly on to the bar to prevent the cuttings from getting into the bush. Another method I have seen in operation, designed by E. Dorney, to prevent the cuttings getting into

FIG. 28.

the bushing, is to have a long sleeve or bushing cast or bolted on to the underside of the drill table, with bushings made to fit, and fastened on to the boring bar with set screws. The bushings are slightly hollowed on the top, so that the cuttings would fall toward the centre and pass through slots cast in the bushing quite clear of the working surface. See Fig. 26.

All holes to be bored ought to be marked off carefully. The centre of the bar must be in the centre of the finished hole, independent of the centre of the original or cored hole. In setting up the job with the haemaphrodites, or jenny-legs, or odd legs, as they are variously called, put the pointed leg in the punch, mark on the circumference of the circle to be finished and let the other leg just touch the bar. Move the job around until each punch mark is an equal distance from the bar. After taking one cut through and the hole is cleaned up, which means that the cutter is cutting all round, test with the haemaphrodites again, only this time measure from the punch marks to the edge of the hole. If the job has been set up true, the measurements from all the punch marks in the finished circle to the edge of the hole will be equal.

### Finishing Holes

It is not good practice to finish boring a cored hole with one cut, as the

cutter is nearly always sure to cut more to one side than the other. This causes the bar to spring and chatter and the hole will not be round. When the hole is uneven to begin with, always finish with a light cut.

In some jobs the centre of the table cannot be used as a support for the bar. In this case improvise a bearing by bolting a piece of cast iron bored out to suit the bar, to the bedplate or baseplate of the drill, or perhaps to an angle plate. Again the job may not permit of any guide or support, such as boring a blind hole. Always finish with a reamer, if possible—if you haven't one, the only thing you can do is to finish with light cuts. When boring to a standard size the finishing cutter should be notched out to fit the bar and turned up in the lathe. Having very little clearance in the finishing cutter makes a smooth hole, too much clearance develops chattering.

### WHAT IS MEANT BY YOUNG'S MODULUS

By N. G. Near.

NO doubt many an engineer has wondered what "Young's Modulus" means. Sometimes it is called the "Modulus of Elasticity." It is frequently used in engineering literature, but the authors never stop long enough with their writings to give an explanation, and the reader, therefore, skips the words "Young's Modulus" and loses the sense of the paragraph, or, perhaps, the whole article.

In the little sketch herewith, I show exactly what it means. Nearly every material is elastic to some extent. Steel, wrought iron, cast iron, glass, leather, rubber, etc., all are elastic.

THIS DISTANCE IS  $S$ , THE STRETCH PER INCH

Consider the illustration to represent a piece of steel one inch long. Its cross sectional area is one square inch. Now, by applying a tensional force to the piece shown on the left, it is bound to "stretch" to some extent, as indicated on the right.

Measure the stretch in inches and the pulling force in pounds. Divide the latter by the former and the result is Young's Modulus.

Stated algebraically, the formula is:

$$E = \frac{\text{Stress } f}{\text{Strain } s}$$

Where  $E$  = Young's Modulus.

"  $f$  = The unit stress in pounds per sq. in.

"  $s$  = The stretch in inches.

Since, in my example, I have used a piece just one inch long with a sectional area of one square inch, we just have to divide the total pull by the whole area.

Stated in a different way, "Young's Modulus is the unit stress necessary to stretch a piece to twice its original length." Perhaps that is more easily remembered. Of course, this is true, provided the material will not lose its elasticity. For instance, if the piece of steel shown will not lose its elasticity, and if a great enough force is applied (30,000,000 pounds would do it), it could be stretched to a length of two inches, or twice its original length. The modulus of elasticity of steel is therefore 30,000,000.

The modulus of elasticity of such a soft metal as copper is only 12,000,000. Of leather, rubber, etc., it is naturally much less.

### UNFAIR TO IMPORTERS

NUMEROUS protests have reached the Dominion Government from Canadian importers regarding the burdensome operation of a provision of the Customs law as enacted under the late Government. This provision requires the collection of duty based upon the fair market price in the country of origin at the time of shipment.

In the case of a deferred shipment—and these have been more the rule than the exception of late—this results in a considerable hardship to the importer for the reason that prices have been steadily advancing in a wide range of commodities. The duty on such shipments is collected on the basis of the advanced price rather than upon the actual purchase price.

The difference is in many cases so great as practically to wipe out the importers' margin of profit. This, unless the importer is in a position to revise his selling arrangements in Canada, is often a serious difficulty. Both the Customs Department and the Department of Trade and Commerce have had the matter brought before them by correspondence and by deputations.

The answer is, of course, that as the collection is made under statute, no change can be made except by Act of Parliament.

Prices Per Lb. Unless Otherwise Stated.

to war requirements as the needs of domestic trade are responsible for much of the recent demand. It is a noticeable fact that the export requirements cannot be entirely satisfied, as agents here are unable to secure the desired material. While no definite confirmation has been received, it is generally conceded that billets and sheet bars will shortly be advanced. The expected addition of \$5 will put the mills price at \$50 per ton. Increased facilities for the production of ferromanganese has had the effect of lowering the price, which is now quoted at \$164, a reduction in two weeks of \$11 per ton.

Increased demand for plates is adding to the pressure already on the steel mills. Deliveries are being extended and consumers are experiencing much inconvenience in covering their requirements. In addition to the activity now developing in car construction the shipyards are also buying heavily and the capacity of the mills is being taxed to the limit. The possibility of a stronger situation in sheet bars is adding strength to sheets, as indicated by an advance of from \$2 to \$5 per ton on the New York market. While galvanized sheets are firm at present, higher prices are looked for. It is anticipated that the additional strength of steel will soon be reflected in wire and wire products. It is possibly for this reason that the demand has recently increased. The pressure on the tube mills, owing to the abnormal demand is excessive, but relief is looked for, when increased production facilities, now under way, are completed. The local situation is at present unchanged but price quotations may undergo a revision, at any time.

**Metals.**

The general tone of the metal market remains the same. Recent developments in copper have established a firmness in this metal that will likely be maintained for an extended period. Tin continues steady and firm but spelter is quiet and easier. Lead is firm but inactive. Antimony is weaker on a dull market. Aluminum is fairly active and higher.

**Copper.**—Following the closing of the recent large order by the British and French Governments, the market has been comparatively quiet. The extent of this order will insure maximum production for many months and in all probability the market will retain its present strong position, well into the coming year. Those consumers who have refrained from covering their requirements may do so now, knowing that the firm tone of the market will likely be maintained for some time. The London situation is indicated in a further advance of £2 on standard and £3½ on electro. The nominal quotations on the New York market are 28½c

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Oct. 2, 1916.—Industrial and commercial activity continue satisfactory and the volume of business shows no signs of diminishing. The steel situation which has been very steady for some months, is again showing indications of moving and in an upward direction. In addition to the activity due to the war considerable progress is being made in the manufacture of articles, which have hitherto been made in other countries. While actual operations along these lines have not yet developed very far, the interest taken in these new products is likely to increase. To offset the shortage of labor, some factories, are beginning to

employ female help and are meeting with very encouraging results.

**Pig Iron.**

The pig iron situation is becoming stronger, as indicated by the price advances quoted and pending. The requirements for steel making pig iron continue to tax the producing capacity of the furnaces and the volume of foundry pig used is showing considerable increase.

**Steel.**

Recent developments are again reflecting the actual condition of the steel market and the trade is expecting a general upward movement in prices. The present strength is not entirely due

for lake, 28½¢ for electrolytic and 26½¢ for castings. Dealers here report a firm and steady market with prices unchanged at 31¢ per pound.

**Tin.**—The market shows a tendency to become stronger, but the buying movement is not very active. Many consumers are still drawing on stocks purchased some time ago and are apparently waiting the settling of the present unstable condition. The difficulty of securing shipping permits and possible loss in transit, still appears to be a guiding factor, although the available supply of tin is of sufficient volume to cover existing requirements. However, little buying has yet been done for next year's business, and activity may be renewed at any time. A general advance of £2, is reported on the London market, and the strength of the New York situation is indicated by an advance of ½¢. The local situation is quiet and quotations have declined 1 cent, the current price being 43½¢ per pound.

**Spelter.**—The market is unsettled but indications point to an advance as there appears to be a shortage of outside offerings and producers are not over anxious to come into the market. The strong position of copper may result in an improvement in the spelter situation, but some time may elapse before the change will develop. The local situation is quiet and unchanged, price being 13¢ per pound.

**Lead.**—The market is still quiet, the demand being fair but not sufficient to affect the general tone. Prices are well maintained. Local price is 9¢ per pound.

**Antimony.**—The refusal of the market to respond to the additional shrapnel orders has resulted in a weaker situation, which is indicated in the decline in quotations. Dealers here report a very quiet situation, with the market becoming easier, the current price of 15¢ being one cent lower than last week.

**Aluminum.**—With a slight increase in the demand coupled with a temporary shortage, dealers have advanced prices 2¢, the quotation being 70¢ per pound.

#### Machine Tools and Supplies.

Activity throughout the machine tool industry continues to indicate a fairly heavy demand for machine shop equipment, especially tools suitable for heavy munition work. In addition to shell requirements, active inquiry is being made for special machinery, showing an improvement in certain lines of domestic trade. The production of many articles, previously made in other countries, is now being favorably considered in Canada and enquiries on the necessary equipment may result in many of these lines becoming part of this country's

industrial production. Firmness continues to feature the small tool supplies, the demand being maintained with prices holding strong.

#### Scrap.

In keeping with the strong position of steel and metals in general, the scrap situation is active and very firm; prices having advanced in most lines of old materials. The requirements for steel making purposes have placed an extra heavy demand on various grades of scrap, the result being a general advance of ¼ cent on the local market. Boiler plates and steel tires are now 12¢ per pound, steel axles 15¾¢, wrought iron axles 19¢, rails 13¾¢, shafting 16¾¢, and malleable, wrought iron pipe and stove plate are quoted at 10¼¢ per pound. Heavy melting steel is now 9½¢ per pound. All copper scrap has advanced ½¢, now ranging from 16¾¢ for light to 19¾¢ is for heavy and copper wire. Machine composition and turnings are up ½¢, quotations being 15¼¢ and 13¼¢ respectively.

#### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

Toronto, Ont., Oct. 3.—Not the least important feature of the prevailing prosperity in Canada is the marked improvement in the financial conditions of many companies, particularly those engaged upon war orders. These concerns have been able to liquidate their liabilities and in many cases have accumulated reserves which has placed them in a sound financial position, and will enable them to develop their business; and also withstand dull trade when it comes. This is especially true of the steel companies, which are doing phenomenal business, and all records have long ago been broken both as regards output and profits. Other indications of trade activity are the marked increase in bank deposits and clearings, and also in the big increase in Customs revenues. The revenue for the first six months of the fiscal year, April to September inclusive, amounted to \$70,564,547, being an increase of \$25,803,717 over the corresponding period last year. For September alone the statement shows that the revenue amounted to \$12,110,182, com-

pared with \$8,029,665 for September, 1915, representing an increase of approximately 50 per cent.

While factories working on war orders, directly or indirectly, are exceptionally busy and production is exceeding all previous records, the maximum output has not by any means been attained owing to scarcity of labor, particularly of the skilled variety. Shortage of raw materials is also in many cases seriously affecting the situation. War orders are, of course, taking precedence over all other business, with the result that purely domestic trade is to some extent suffering. Apart from the labor situation, the outlook in business circles was perhaps never brighter, and further stimulus will be given to trade by another war credit for \$50,000,000, which has recently been established for the purpose of financing purchases by the British Government of munitions and supplies in Canada.

#### Steel

There is no sign of any break in the extraordinary activity which prevails in the steel trade, and indications point to a continuance of present conditions for an indefinite period. There is no improvement in the situation as regards the scarcity of steel, the demand is exceeding the supply to a greater degree than at any other period in the history of the trade. Although the mills are operating at capacity, they are unable to keep pace with the demand for steel for munitions and general purposes, and are getting further behind all the time on deliveries. The serious shortage of steel rails, which has developed, is due to the war, as those steel mills, with the one exception, which have rail mills, are engaged in producing shell steel and are not taking orders for rails. The urgent demand for steel for munitions precludes the possibility of much improvement in the situation in the meantime, although the proposed remission of the tariff duties to permit rails coming in from the United States may help matters. Whether this will give the desired relief is uncertain, as the mills in that country are congested, and may not be able to make satisfactory deliveries. Much concern is manifest in the trade on account of the proposed increase in freight rates on iron and steel from interior points to the seaboard for export. The steel manufacturers are protesting and some compromise may be affected.

The market continues very firm, and all prices have an upward tendency. Recent advances include 15¢ on boiler and structural rivets, while it is expected that higher prices on steel and iron bars will be announced in the near future. Boiler tubes and plates will probably advance shortly, the latter being particularly firm and hard to get just now.

The market for galvanized sheets in

the United States is considerably stronger and higher prices are anticipated, in which case an advance may be looked for in this market. The reason for the renewed strength is the unusually heavy demand, and also because of the continued high cost of black sheets. The demand for both black and blue annealed sheets is heavy and the market is stronger. As sheet bars will be higher for fourth-quarter delivery, sheet prices will no doubt be advanced in the near future.

Increased activity characterizes the steel market in the United States. The scarcity of steel is becoming more serious, and there is little expectation of any relief in the situation, as capacity production is looked for during the greater part of 1917. The mills are in a sold-up condition, and they are getting further behind on deliveries. Although prices of steel products are now higher than they ever have been, it is certain that the market has not stopped advancing. Wire products and pipe are higher, while sheets are advancing, and higher prices on bars, plates and shapes are looked for any time. The export demand is apparently unlimited, while domestic consumption has increased considerably.

#### Pig Iron

The pig iron market continues firm, and it is possible that prices of domestic iron will advance. Several brands of United States pig iron have made a further advance during the week, the new prices being as follows:—Basic, Valley furnace, \$19; Bessemer, \$22.95; and gray forge, Pittsburgh, \$19.20. Foundry iron remains steady, but the consumption of steel-making brands is steadily increasing.

#### Scrap

The market for old materials is firmer, and although there are no important changes to note this week, it is possible that copper may advance in the near future owing to the increased strength in that market. The lead market is stronger and heavy lead has advanced. Prices of heavy melting steel have been well maintained, the demand being good and market firm. Business continues good and the general situation satisfactory.

#### Machine Tools

Business continues brisk, but would be considerably better if conditions in the shell plants were more favorable. The shortage of labor and difficulty that is being experienced in getting sufficient supply of forgings are adversely affecting production. If the machine shops were able to operate at capacity, as they should be doing, then the demand for tools would be heavier. The demand for heavy duty lathes continues to be the principal feature in the trade, and new designs are still being placed on the market. These special tools for machin-

ing munitions continue to keep local machine shops busy, and in some cases considerable export business has been done. Deliveries are fairly good on large lathes, but still very slow on milling machines and grinders.

#### Supplies

Business continues very good and prices firm, with a higher tendency. Lead wool has advanced 1c, and is now quoted at 12c per pound. Plumbers' oakum is higher at 7½c per pound. Gasoline and benzine are unchanged, but an advance in crude oil is looked for in the United States, which would likely result in higher prices on gasoline here. Brass wire has advanced, and is now quoted at the following discounts:—3 to 24-gauge, list plus 40 per cent., and 25 to 30-gauge, list plus 25 per cent.

#### Metals

The metal markets generally are firmer, but prices are unchanged, with the exception of copper, which has advanced. The most interesting feature this week has been the closing of a big order for copper by the Allies with American producers. This will have the effect of keeping the market steady. There is little of interest to note in the other metals and prices have been maintained.

**Copper.**—The market is strong and active, following the big order for about 450,000,000 pounds of copper, which has been placed in the United States by the Allies. The order represents three months' output, and is by far the largest order of its kind ever closed. Delivery is to be made over the first six months of 1917, and the price is stated to be between 26 and 27 cents. The new contract following on reports of the sold out condition of the producers emphasizes the broad extension of current activity. As the buying of copper for domestic account continues heavy, the fact that a quarter of the 1917 output of the American copper producers is bespoken in one block postpones the date at which new orders for home account can be filled well on to the end of the year. Copper has advanced 1c per pound, and is now quoted locally at 31c per pound.

**Tin.**—The market is firmer, with quotations well maintained, due to increased demand. London market has advanced, and New York is also slightly higher, but local quotations are unchanged at 44c per pound.

**Spelter.**—The market has improved on large buying recently, and is now firmer, although quotations are unchanged. It is expected that the recent large order for copper will eventually benefit the spelter market, which might result in higher prices. Local prices, 14c per pound.

**Lead.**—The market is firm and fairly

active at unchanged prices, the "Trust" figure still being 7c, New York. The lead situation is a strong one, and will possibly remain so for the remainder of the year. Local quotation, 9c per pound.

**Antimony.**—Quotations are unchanged and nominal, and the market continues dull. Local price, 18c per pound.

**Aluminum.**—Sellers report good demand, and the market holds steady at 68c per pound.

**Solders.**—Prices of solders have advanced ¼c per pound, following the increase in cost of lead. "Guaranteed" is quoted at 27¾c and "Strictly" at 25¾c per pound.

### AUSTRALIAN COMMISSION WILL STUDY METHODS OF CANADIAN MANUFACTURERS

ACCORDING to a report received at Ottawa by the Trade and Commerce Department by Canadian Trade Commissioner Ross at Melbourne, the Commonwealth Government has appointed a commission to visit Canada and the United States to investigate and report upon methods of manufacture and production, and the conditions of employment on this continent. The commission will consist of representative manufacturers of Australia, together with six representatives of the workers. It will spend about four months in Canada and the United States, and the industries to be specially investigated are iron engineering and allied trades, timber, building materials, leather, textiles, paper and trades in the preparation of foodstuffs.

In connection with the proposed commission, it is interesting to note that Canada's trade with Australia during the past year has shown a very large increase. Canadian imports from Australia during the twelve months ending June, 1916, total \$3,251,558, an increase of nearly 500 per cent. as compared with the preceding 12 months. Canadian exports to Australia during that period totalled \$8,542,065, an increase of almost three millions.

### ACTIVITY IN AUSTRALIAN LEAD SMELTING

THE Sulphide Corporation, Ltd., a smelting works 10 miles from Newcastle, Australia, is operating at capacity, employing about 450 men, working three shifts of 8 hr. each, according to U.S. Consul Lucien N. Sullivan, of Newcastle. There are three smelting furnaces of respectively 150, 100 and 50 tons capacity of bullion turned out daily, the ore treated being about three times the amount of bullion produced. The gold and silver contents are high, but no separation is made there, the pig lead being shipped to England and Sydney for refining. The weekly output is at present (August.

1916), bullion containing 585 oz. of gold, 61,434 oz. of silver and 685 tons of lead. The company's mines are located in the Broken Hill district.

### C. P. R. WORLD-WIDE ACTIVITIES

IF all the trackage over which the Canadian Pacific Railway has control—that is, all the leased lines, or lines taken bodily over, or with running rights—be included in a grand total, the company operates to-day 20,000 miles of tracks. This fact alone would tell of the bigness of the corporation which, thirty years ago, issued its first annual statement on a sheet of note paper. The company owns 100,000 miles of telegraph; 10,000,000 acres of unsold lands, worth \$200,000,00; and controls shipping to the extent of 40,000 tons. One of the notable features of the great corporation is, that it takes account of so many things, which, at the first blush, might not seem to be related to railway transportation. The comfort of the inner man on the trains is, of course, of prime moment; but note how the C. P. R. went out of

its way to provide dietetic gastronomy. The railway company milks its own cows, and makes its own soap. It bakes its own bread; and it bores a tunnel through the mountains above the clouds. It grows its own potatoes, and its policies are of world-wide import and significance.

### RECORD STEEL PRICES

CURRENT prices for steel products in the United States are the highest in the industry's history. Eight leading products now average \$61.63 a ton, which is 56 cents a ton higher than the previous high level on May 1 last. A year ago these same products averaged \$33.40 a ton, and at the beginning of 1915, \$29.94 a ton. The course of the average for twelve months follows:

1916.	
September .....	\$61.63
August .....	60.40
July .....	60.17
June .....	60.79
May .....	61.07
April .....	56.40

March .....	53.59
February .....	46.27
1915.	
January .....	43.40
December .....	39.68
November .....	35.45
October .....	34.58

### GALV. CORRUGATED SHEETS

THAT there is a substantial demand in New Zealand for corrugated galvanized sheets, is reported by Canadian Trade Commissioner Beddoe. There is a duty on galvanized corrugated sheets in New Zealand of £2 a ton on goods made in the British Empire and £2 8s. a ton on foreign goods, thus providing a preference of 8s. a ton for Canadian goods as compared with foreign goods.

He says: "There is a difficulty in securing mild steel bars and structural iron in New Zealand. Orders have recently been filled for mild steel bars from India at prices below the latest Canadian quotations. This is a business that has arisen since the war and will be watched with considerable interest."

## CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

# INDUSTRIAL <sup>A N D</sup> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**Bagotville, Que.**—The Ha-Ha Bay Sulphite Co. propose erecting a paper mill.

**Glenora, Ont.**—J. C. Wilson & Co. will build a machine shop, 150 ft. by 50 ft.

**Quebec, Que.**—Price Bros. will enlarge their newsprint sulphite and wood pulp mill at Chicoutimi.

**Hamilton, Ont.**—The Dominion Steel Castings Co. will build a factory here to cost about \$75,000.

**Hamilton, Ont.**—The Dominion Steel Foundry Co. propose making further additions to their plant to take care of the increase in business.

**Hamilton, Ont.**—A permit has been issued to the Canadian Steel and Wire Goods Co. for erection of addition to factory at a cost of \$1,500.

**Toronto, Ont.**—The city architect has issued to the Russell Motor Car Co. a permit to erect machine shops on Dufferin Street, corner of Liberty, to cost \$40,000.

**Niagara Falls, Ont.**—Fire of an unknown origin broke out on Sept. 24 in the Dominion Chain Co.'s factory and caused damage to the extent of about \$500.

**Toronto, Ont.**—The Willys-Overland, Ltd., are making extensive improvements to their plant here, and also propose making important additions in the near future to take care of the increase in volume of business.

**Ottawa, Ont.**—Tenders for another section of the Welland Canal—section four—will likely be invited before long, but the remaining four sections will be left till after the war concludes. The work at sections one, two, three and five is now about half done. Upwards of twelve hundred men are employed.

**Quebec, Que.**—The International Paper Co. are building an addition to their mill at Donnacona, near here. A paper making machine is being installed at a cost of about \$150,000. About fifty-three tons of paper are made daily, and the new equipment will double the capacity. Mr. McKee is manager of the mill.

**Dundas, Ont.**—The inter-switching station of the Provincial Hydro-Electric

Commission, which was burned out about two months ago, is back in service. Chief Engineer F. A. Gaby announced that the work of re-equipping the station had been completed, and that Toronto and other municipalities were now being served via Dundas instead of directly from Niagara.

## Municipal

**Lethbridge, Alta.**—The by-law to authorize an expenditure of \$100,000 on a water filtration plant was passed by the ratepayers on Sept. 22 by a large majority.

**Sherbrooke, Que.**—The Waterworks' committee have recommended the purchase of a Gould horizontal pump and turbine combined, of 4,800,000 gallons capacity per 24 hours.

**Lethbridge, Alta.**—The by-law to submitted to the ratepayers on October 17 to sanction an issue of \$17,076 in debentures to cover the cost of an extension to the electric light systems, an ash flue at the power house, and for extending the electrical system.

**Winnipeg, Man.**—A committee of engineers, consisting of Gen. H. W. Rutan, J. G. Sullivan, and R. S. Lea, have reported that the aqueduct from Shoal Lake to Winnipeg will carry out in every particular the work for which it is designed. They estimated that the work can be completed at a cost of \$6,867,700, or about \$230,000 less than the original estimate.

**Winnipeg, Man.**—J. B. Challies, superintendent of the Water Power Branch of the Dominion Department of the Interior, in a report to the City Council, states that Manitoba, and particularly Winnipeg, is very favorably situated as regards water power available for development. John R. Freeman, of New York; J. B. McRae, of Ottawa, conducted an investigation upon which the report was based.

**Dundas, Ont.**—The town council expects to have completed shortly the concrete storage dam at Greenville. By its construction it will give the town a possible reserve storage for its water supply of nearly twenty million gallons of water. This supply will be available without requiring pumping. The dam is of solid concrete construction, and is de-

signed for a head of 23 feet. Its over all length is 100 feet. The work is being carried out under the direction of the Dundas Public Utilities Commission. E. H. Darling is the consulting engineer.

**St. Catharines, Ont.**—By a light vote of 680 to 132 the ratepayers carried a cheap natural gas by-law granting a franchise to the Relief Amalgamated Gas Co. to supply natural gas to St. Catharines through the system of mains now owned by the city. The company is to supply natural gas at 45 cents for the first thousand and 40 cents for each succeeding thousand feet per month to consumers. The company also gets an option to buy the city's plant at \$90,000 or \$100,000 should the natural supply become exhausted, and go into business of making a supply.

## General Industrial

**Guelph, Ont.**—The Dominion Linens Co. will build an extension to their factory here.

**Saskatoon, Sask.**—The Saskatoon Bread Co. will build a factory here to cost about \$15,000.

**Peterborough, Ont.**—The Quaker Oats Co. propose making considerable extensions to their factory here.

**Belleville, Ont.**—The Maple Leaf Tires, Ltd., have commenced the erection of a factory, estimated to cost \$100,000. The president is H. C. Long, Toronto.

**St. Thomas, Ont.**—A. F. Voegel, manager of the Canadian Woodenware Co., whose plant was destroyed by fire recently, will rebuild at once. Mr. Voegel expects to have new machinery here next week, and when this is installed, will commence operations.

**Winnipeg, Man.**—The Carnefac Stock Food Co. has approved the plans of J. S. Metcalf, architect, and will erect at once, on the site formerly occupied by the mills of the Rice Malting Co., which were destroyed by fire at St. Boniface, a two story concrete elevator block 38 by 42 feet, at the cost of \$25,000.

**Port Arthur, Ont.**—An agreement has been signed between the city and an Eastern Ontario syndicate under which a pulp mill will be established in Port Arthur on the north waterfront. The first unit is to be started within thirty

## Boring Economy

Two great factors in economic boring operations are the Bridgeford Boring Lathe and the Davis Boring Heads. Combining the massive strength of this Bridgeford Lathe and the tough, superior quality of a specially constructed Boring Head and you have an ideal combination that will save you at least 25 per cent. to 50 per cent. on your Boring operations. The lathe is a machine of ideal proportionate strength, the stresses have been scientifically calculated, the vital points strengthened, resulting in a smooth-running, perfectly balanced unit that ensures efficiency, economy, speed and superior production.

## Bridgeford 9.2" Boring Lathe

The lathe is of the heavy duty, low swing type, having a specially designed carriage with auxiliary hand feed for internal profile. Carries a 6 inch steel bar with male taper, allowing for light designs of cutter heads; 3 automobile style speed changes, all running in oil bath. A chip tray is attached and is used in conjunction with stationary lubricant tank. Regular equipment comprises everything except chuck, steady rest and cutter.

## Davis Boring Heads

The boring heads are a new construction. Having benefited by the experiences of the "pioneering days" this type of head has been constructed, making a direct cut in the cost of boring operations of 25 per cent. to 50 per cent. Being made of that superior quality high speed steel you will have boring heads that will last, that will prove to you their saving power.

A 25% to 50% saving on boring operations will be welcomed by shell manufacturers. Illustrated here are four boring heads: Rough bore, straight diameter; finish bore, straight diameter; rough bore, inside radius; finish bore, inside radius. These heads may be adapted to any lathe and will give you economical, speedy and efficient service.

*Write us for particulars.*

*If any advertisement interests you, tear it out now and place with letters to be answered.*

days of the approval of the agreement and be completed and operating within one year. It is to have a capacity of fifty tons of pulp per day. Inside of five years this capacity is to be increased to 150 tons of pulp per day, whereupon the company will receive a deed for a further tract of land, making a total of ninety-seven and one-half acres. Aimwell G. McIntyre, of Toronto, is one of the principal members of the syndicate.

## Marine

**New Glasgow, N.S.**—The keel has been laid for the 2,000 ton steel steamship which the Nova Scotia Steel and Coal Co. is building here.

**Montreal, Que.**—A report has been received here from London that the Manchester liners have added three vessels to their fleet for the Canadian trade.

**Digby, N.S.**—The steamer Mikado, of the St. Mary's Bay Steamship Co., and commanded by Captain Sinclair Cann, of Westport, went ashore on a ledge on the eastern side of the St. Mary's Bay entrance of Petit Passage on September 23, and it is expected will prove a total loss. The Mikado was built in Shelburne in 1896 and is 82 feet long, 18 beam, 7 deep and registers 80 tons gross.

**Sidney, N.S.**—The steamer Storstad, which rammed the Empress of Ireland two years ago, was again in a collision which will cost the owners of the other craft something like \$20,000 to repair, while the Storstad escaped with only minor injuries. The accident occurred at North Sydney recently while the Storstad, in ballast, was coming down from the coal pier of the Dominion Coal

Co., and another Norwegian steamer, the Hafters, was on her way to a berth at the pier. The impact ripped a number of plates off the latter steamer and badly damaged her bow. Who the blame rests upon will be fought out in the courts.

**To Prevent Delays to Munition Ships.**—An Order-in-Council has passed under the War Measures Act, providing regulations designed to prevent delays to ships employed by the Admiralty through collision or through desertions. Injury to a ship so employed through negligence or design on the part of the master of another ship is made an offence against the Act. A seaman who deserts, is absent without leave, or who is too drunk to perform his duties and so delays the ship, violates the Act. Ships' officers, naval and military officers, constables and peace officers are given authority to enforce the regulations and maximum penalty of five thousand dollars and five years' imprisonment is provided for each violation.

## Building Notes

**Parliament Buildings Contract.**—The final revision of the contract for the construction of the Parliament Buildings was made on September 28 at a session of the Parliamentary Committee. The contract will be executed finally. The effect of the new arrangement with regard to the manufacturing plant is that the Government will assume the cost of depreciation, the plant remaining the property of the contractors when the work is done. As arranged previously, the contracts are to be paid at the rate of 8 per cent. on the cost of the new

buildings up to \$4,000,000; 7 per cent. on any additional cost up to \$5,000,000. No percentage is to be paid on the cost over \$5,000,000.

## Refrigeration

**Winnipeg, Man.**—Steps are now being taken to secure the incorporation of the Ontario and Manitoba Storage Co., whose intention it is to build a cold storage plant at the foot of Notre Dame Avenue, for the purpose of keeping perishable fruit shipped in from Ontario in good condition indefinitely. The building will be started this fall. It will have a frontage on Notre Dame Avenue of 170 feet with a depth of 80 feet and a height of five storeys. Charles Chamberlain, of this city, is interested.

## Tenders

**Prince Albert, Sask.**—Tenders will be received by the undersigned up to Oct. 11, 1916, for lubricating oils, cotton waste, cotton rags, or wiping cloths, required at the power station for six months. Specifications and particulars obtained on application to the City Electrical Superintendent, J. B. Brown, city clerk.

**Ottawa, Ont.**—Tenders will be received by the undersigned until Tuesday, October 10, 1916, for the structural steel required in the erection of the above building. Plans and specifications and any other information required can be obtained at the office of the architects, John A. Pearson and John O. Marchand, Centre Block, Parliament Hill, Ottawa.

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department is able to present the following list of the moreimportant British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

### BRAZIL

Bahia, British Consul.  
Rio de Janeiro, British Consul General.

### CHILE

Valparaiso, British Consul General.

### COLOMBIA

Bagota, British Consul General.

### ECUADOR

Quito, British Consul General.

### EGYPT

Alexandria, British Consul General.

### FRANCE

Havre, British Consul General.  
Marseilles, British Consul General.

### INDIA

Calcutta, Director General of Commercial Intelligence.

### ITALY

Genoa, British Consul General.  
Milan, British Consul.

### MEXICO

Mexico, British Consul General.

### NETHERLANDS

Amsterdam, British Consul.

### PANAMA

Colon, British Consul.  
Panama, British Vice-Consul.

### PERU

Lima, British Vice-Consul.

### PORTUGAL

Lisbon, British Consul.

### RUSSIA

Moscow, British Consul General.  
Petrograd, British Consul.  
Vladivostok, British Consul.  
Odessa, British Consul General.

### SPAIN

Barcelona, British Consul General.  
Madrid, British Consul.

### SWEDEN

Stockholm, British Consul.

### SWITZERLAND

Geneva, British Consul.

### URUGUAY

Monte Video, British Vice-Consul.

### VENEZUELA

Caracas, British Vice-Consul.

# Aikenhead's DUMORE PORTABLE GRINDER

The great many uses that the DUMORE can be put to makes it a tool that is in constant use. It is a light, convenient tool to use. It can be set up in a lathe, milling machine or shaper in a few minutes, and is ready for work; simply attach it to an ordinary lamp socket. The motor is a Universal Motor operating on direct or alternating current; furnished to operate on any lighting circuit.

**Aikenhead Hardware Limited**  
17 TEMPERANCE STREET - TORONTO

## "The Die Head That Thinks"

### GEOMETRIC STYLE "D-D"

With such precision does the Geometric Style "D-D" Die Head perform every action, it has been called the Die Head that thinks.

Compensating springs give perfect threads at the start, and cause the dies to follow the lead properly. The head will float in either direction. On heavy turrets it is not necessary for the operator to follow the thread closely. Fine adjustments can be made for length right in the Die Head itself, without changing the stop on the machine.

The Style D-D Die Head illustrated above is cutting a 2-inch, 14 thread on fuse plugs, on a hand operated turret.

Are you among the small minority of screw thread makers who have not discovered Geometric advantage?

**The Geometric Tool Company, New Haven, Conn., U.S.A.**

*Canadian Agents:*

Williams & Wilson, Ltd., Montreal. The A.R. Williams Machinery Co., Ltd., Toronto, Winnipeg, St. John, N.B.

*If any advertisement interests you, tear it out now and place with letters to be answered.*

**Montreal, Que.**—Tenders for furnishing all labor and materials and constructing the Church Bridge and appurtenances forming a part of the Aqueduct Enlargement Work for the City of Montreal, P.Q., address to the Board of Commissioners, Montreal, will be received at the office of the Board of Commissioners, at Montreal, until Tuesday, October 10, 1916. All shall be in accordance with the plans and specifications on file in the office of the Chief Engineer of Public Works of Montreal, from whom copies may be obtained upon depositing \$25.00.

## Contracts Awarded

**Aylmer, Que.**—The City Council has awarded a contract to the New York Continental Jewell Filtration Co., Montreal, for a mechanical filter for the waterworks plant.

**The Wm. Hamilton Co.,** Peterborough, Ont., have received an order from the Hought Paper Mills for a 30-in. 240 h.p. water turbine to drive the new mill on the Napanee River at Camden East, Ont.

**Montreal, Que.**—The Dominion Bridge Co., has been awarded the contract for 3,000 tons of steel shapes for the International Nickel Co. plant, which will be erected at Port Colborne, Ont.

## Railways—Bridges

**Victoria, B.C.**—The importance of bridging Seymour Narrows so as to connect Vancouver Island with the mainland by rail was urged from the viewpoint of Imperial defence recently before the Dominion Royal Commission.

**Welland, Ont.**—The Hydro Electric Commission have asked the Town Council to pass a resolution requesting the Lieutenant-Governor in Council to authorize the submission of a by-law to the electors for the building of a hydro radial line from Welland to Port Colborne to Fort Erie and Bridgeburg. The total cost of right-of-way construction and equipment is estimated at \$2,000,000.

## New Incorporations

**The Dominion Soap Co.** has been incorporated at Ottawa, with a capital of \$50,000, to manufacture soap, powders, creams, etc., at Hamilton. Incorporators: J. A. Henderson, F. A. Magee and John Clayden, all of Hamilton, Ont.

**The F. E. Partridge Rubber Co.** has been incorporated at Ottawa, with a capital of \$125,000, to manufacture rubber products of all kinds at Montreal.

The incorporators are: G. V. Cousins, N. R. Currie and F. E. Partridge, all of Montreal.

**The Sunbury Copper Co.** has been incorporated at Toronto, with a capital of \$1,000,000, to acquire and develop mineral lands and deposits, with head office at Toronto. Incorporators are: R. H. Parmenter, W. S. Morlock and S. D. Fowler, all of Toronto.

**Canadian Wood Products, Ltd.,** has been incorporated at Toronto, with a capital of \$40,000, to manufacture wood products of all kinds, with head office at Toronto. Provisional directors are: K. F. Mackenzie, A. R. Reid and A. T. Shortt, all of Toronto.

**Brunner Mond Canada, Ltd.,** has been incorporated at Ottawa with a capital of \$3,000,000 to manufacture soda ash, caustic soda and other chemicals. Head office in Toronto and the incorporators are James S. Lovell, Charles D. Magee and Ernest H. Stewart, all of Toronto.

**The Dodge Metal Hose Co. of Canada** has been incorporated at Ottawa, with a capital of \$150,000, to manufacture metal hose, couplings and connections. Head office at Toronto, and the incorporators are: D. L. McDonald, E. G. Gibson and O. N. Birchard, all of Toronto.

**The Tip-It Welding Co.,** has been incorporated at Ottawa with a capital of \$20,000 to manufacture all kinds of engineers' hardware, contractors, builders' and machinists' supplies at Montreal. The incorporators are H. Weinfield, M. M. Sperber and Y. Fortier of Montreal.

**Charles Jackson & Sons,** with incorporation in Great Britain, has been granted a license to carry on business as manufacturers of linoleum, floor cloth and similar materials, in the Province of Ontario, with a capital not to exceed \$40,000. W. H. Baker, of Toronto, is the attorney.

**The Western Power Co. of Canada, Ltd.,** has been incorporated at Ottawa with a capital of \$10,000,000 to carry on the business of an electric light and power company with headquarters at Montreal. Incorporators are C. M. Holt, A. Chase-Casgrain and E. M. McDougall all of Montreal.

**The Panther Rubber Co.** has been incorporated at Ottawa, with a capital of \$100,000, to take over the Canadian business of the Panther Rubber Co., of Stoughton, Mass., and to manufacture rubber goods of all kinds. The head office is at Sherbrooke, Que., and the incorporators are: H. F. Fraser, F. S. Rugg and C. A. Joslin, all of Sherbrooke, Que.

## Trade Gossip

**The Doty Engine Co.,** of Goderich, Ont., has changed its name to that of the Britannia Engine Co.

**Edmonton, Alta.**—Reports from the Peace River country indicate that important developments in the potash industry may be expected. Active boring will commence next spring on Salt Prairie, and already machinery for the purpose has been stored at Vermilion Chutes.

**Tungsten Found in Canada.**—Tungsten deposits are now being worked experimentally near the banks of the Miramichi River, in New Brunswick. Three veins of ore are reported, one being 26 in. thick. A concentrating plant of 20 tons daily capacity and a crusher have been installed.

**Antimony in Alaska.**—The considerable demand for antimony during the last year has stimulated the development of certain Alaskan deposits of that metal, from which ore to the value of about \$74,000 was mined and shipped during 1915, according to a report published by the United States Geological Survey.

**Toronto, Ont.**—The committee on organization for advertising Toronto has recommended an expenditure of \$600,000 per year for three years, the money to be raised from the business organizations, and the city to make a contribution. Efforts will be made to attract new industries and stimulate local enterprises.

**Developments on St. Lawrence Route.**—Reports from London England, indicate that tentative arrangements are being considered whereby the shipping companies will organize to develop transatlantic trade on the St. Lawrence River. By this means the volume of trade on the St. Lawrence route will be largely increased.

**The Eastern Car Co.,** Halifax, N. S., has completed the first contract for 1,000 cars for France, and expects to begin deliver next month on the second French order, calling for 3,000 cars. Work is also being commenced on 500 freight cars for the Canadian Government Railways. The company is negotiating for a contract to build 4,000 cars for another foreign Government.

**Tungsten Prices in Great Britain.**—Ferro tungsten prices in Great Britain have just been revised by the Minister of Munitions. A cablegram to *Commerce Reports* says the new basis is 5s. 6d. per pound of contained tungsten, with powdered tungsten at 6s. 3d. per pound based on 60s. per unit, the price of products on a sliding scale rising or falling

1d. per pound with each variation of 1s. per unit of ore.

**The Allied Machinery Trust Co.,** of New York, which has been organized for the purpose of marketing American machine tools in Europe, has been acquired as a subsidiary by the American International Corporation. P. B. Sheridan, formerly general manager of the Brown Hoisting Machine Co., Cleveland, O., has been elected president of the Allied Machinery Co.

**Manila Needs C.O.**—Before the outbreak of the war practically all of the carbonic acid gas used in Hong-Kong, other than that produced locally by a manufacturer of aerated waters, was imported from Germany, and since then dealers have fortunately been able to replenish their stocks from Manila. This latter source, however, has temporarily failed, and many inquiries are now being received.

**Granby August Output.**—August production of Granby Consolidated was \$3,218,847 pounds of copper, against \$4,268,846 pounds in July. A shut-down of several furnaces at the old Grand Forks smelter was responsible for the loss. Within the past fortnight, however, one of the idle furnaces has been put into blast, and the other will be blown in shortly, so that production from that property should be normal for October.

**Dollar Credits.**—The term "Dollar Credits" frequently referred to lately in connection with war orders means the setting aside by the Canadian banks of certain funds here for the use by the British Government. It does not necessarily mean another war loan, but is a method of using available money for the purchase of munitions and war supplies in Canada, thus being of material financial assistance to the Imperial Government.

**Sweden's Lumber Industry.**—Lumber, wood pulp and their manufactures make up nearly half the total exports of Sweden. The State-owned forests show a net profit of approximately \$3,000,000. The Swedish lumbering industry is conducted scientifically and is under rigid supervision. Timber-cutting for sale may not be undertaken before the State foresters have marked each tree ripe for sale, and only a certain number are marked, so as not to endanger the future of the industry.

**Oil Steamer Sarnolite Launched.**—Promptly at one o'clock on September 27 the oil tank steamer Sarnolite was successfully launched at the yards of the Collingwood Shipbuilding Co. This is the third vessel of the type built for lake and ocean traffic for the Imperial Oil Co.

by the Collingwood Shipbuilding Co., two vessels of the same size having already been placed in commission this year. The vessel is built of steel and fully equipped with engines, machinery, etc., by the local firm.

The christening ceremony was performed by Mrs. C. O. Stillman, of Sarnia. Among the distinguished party from outside points were: C. O. Stillman, vice-president of the Imperial Oil Co.; Mrs. Stillman and Mrs. Ellsworth, of Sarnia; T. B. F. Benson, representative of Lloyd's Shipping Registry of Toronto; Hugh Calderwood, of Barrie, and Mr. P. J. Lynch and Miss Lynch, of Allandale. After the ceremony a banquet was given at the Globe Hotel by the Collingwood Shipbuilding Co. to the launching party. On behalf of the builders Mrs. Stillman was presented with a beautiful gold wrist watch as a souvenir of the occasion, by Sanford H. Lindsay, secretary-treasurer.

**Proposed Nickel Refinery.**—As a result of pressure put on the International Nickel Co., the management has set aside \$5,500,000 from its cash on hand for the construction of a refinery at Port Colborne, Ont., and the extension of its smelters and other facilities. All this money will be spent in Canada. It has been realized by the directors of the company that the present capacity of its plant is inadequate to meet the demands for nickel. Consequently the new construction programme will be begun immediately and will be rushed.

**Paper Plant for Canada.**—Nathaniel M. Jones of Bangor, Me., announced recently that a conference of capitalists in New York, the sale of the largest pulp and paper mill in the Canadian Maritime Provinces to a syndicate of Maine and New York men was arranged. The property, for which it is said \$2,000,000 will be paid, includes mills at the Reversing Falls, near St. John, N.B., and large timber lands in New Brunswick. The syndicate includes Hugh Chisholm of Portland, President of the Oxford Paper Company, and Maynard S. Bird, also of Portland.

**Empire-Made Goods.**—New Zealand is starting a campaign for the purchase of nothing but "Empire-made" goods, viz., goods made in the British dominions. It has begun in Auckland, and may spread all over New Zealand. The Auckland Provincial Industrial Association has appointed a committee to obtain the co-operation of merchants, manufacturers, storekeepers, and others in a demonstration in favor of Empire-made products. It is proposed to distribute patriotic posters emphasizing the need for purchasing only these products wherever possible.

### Will Develop Export Paper Trade.

With the incorporation of the Canadian Export Paper Co. in Montreal, with a capital of \$500,000, is taken the first step in an extensive plan, for the further development of the export field in the paper industry. The charter provides for the importation, exportation, manufacturing and handling of paper of all kinds, and allows the company to act as agents for the manufacture of and dealers in paper. It is stated by officials of the large paper companies who are back of the scheme that the newly-formed company will include most of the newspaper manufacturing industry of the Province of Quebec.

**Customs Revenues.**—Canada's Customs revenue so far this year is better than the revenue of last year by more than fifty per cent. A statement recently issued under the directions of Hon. J. D. Reid, Minister of Customs, gives the revenue for the first six months of the fiscal year—that is, to the end of September, to the amount of \$70,564,547.46. The increase as compared with the revenue for the corresponding period of last year is \$25,803,717.28. The statement for September shows that the increase is being well maintained, the Customs revenue for the month amounting to \$12,110,181.93, compared with \$8,029,665.17, an increase of \$4,080,516.76, or slightly over fifty per cent.

**C. G. E. Exhibit of Munitions.**—The exhibit of munitions manufactured by the Canadian General Electric Co. and Canadian Allis-Chalmers, and shown at the Canadian National Exhibition, Toronto, attracted so much attention that these companies have decided to continue it for a time at their general office building, corner of King and Simcoe Streets, Toronto. Shrapnel and high explosive shells of many kinds for both army and navy, cartridge cases, primers and other munitions are shown completed and also in course of manufacture. The processes of manufacture are shown completed and also illustrated by beautiful photographic transparencies which give vivid ideas of the operations. The exhibition will be open to the public daily from 10 a.m. to 4 p.m., except on Saturday, when it will close at 1 p.m.

### Delivery of Coal to Coast Vessels.

The Dominion Government has appointed a special commission to investigate conditions relating to delivering coal to coasting vessels in the Maritime Province waters. The commission consists of Wilfrid E. Tupper, inspector of subsidized steamship service of the Department of Trade and Commerce; Archibald R. Tibbits, officer in charge of harbor commissioners, Department of Marine and Fisheries, and J. Fred McDonald, of New Glasgow, Nova Scotia,

collector of Customs. For some time owners of small vessels, particularly sailing ships, have been complaining against alleged discrimination in favor of steam coal carrying vessels. Protests from Prince Edward Island have been particularly vigorous. The Island Legislature at its last session by resolution asked for a Royal Commission.

## Personal

J. G. Buckeye has resigned his position with the Buckeye Machine Co., Calgary, Alta., effective October 1, and expects to engage in business for himself.

J. A. Johnston, who for some time has filled the position of district inspector of the Ontario Hydro-Electric Commission, has been appointed manager of the Brookville Light and Power Department.

O. J. Root, president of the Root and Vandervoort Engineering Co., East Moline, Ill., who is making a business trip through Canada, paid a visit to Toronto on his way to St. John, N.B. Mrs. Root is accompanying her husband.

Nicholas Quesnel, who, for the past six years, has been with the Boiler Inspection and Insurance Co., Toronto, has joined the staff of the Boiler Inspection Branch of the Department of Public Works, Parliament Buildings, Toronto.

J. J. Main, a member of the production department of the Imperial Munitions Board, has recovered from his recent serious illness, and has just returned to Toronto from a brief visit to Montreal. He will immediately resume his duties.

J. E. Dailey, formerly with the Brier Hill Steel Co., and more recently with the Algoma Steel Co. at its Sault Ste. Marie works, has just been appointed superintendent of the Youngstown Iron & Steel Co.'s open-hearth plant, vice Archibald Smith, resigned. The change will become effective about October 1.

J. W. Flavelle chairman of the Imperial Munitions Board, is leaving early in October for England. It is understood that the object of his visit is to take up directly with the Minister of Munitions matters affecting the present output of munitions in Canada and arranging for production during the coming winter.

## Catalogues

The "S-C" Pump Governor is the subject of bulletin B 25, issued by the "S-C" Regulator Co., Fostoria, Ohio. The distinctive features of this apparatus are dealt with in detail accompanied by a material specification, principal dimensions, operation and rules for installing etc. The illustrations show a sectional view of the governor and also an installation.

The "S-C" Regulating Co., Fostoria, Ohio, have distributed to the trade a bulletin B 26, entitled "Feed Water Regulation Engineering" in which the subject is dealt with in connection with the "S-C" feed water regulator. This type of regulator is illustrated and described and its method of operation is also fully described while mention is made of the exclusive features. A partial list of customers is included.

**Fluid Meters.**—The Bailey Meter Co., Boston, Mass., have issued bulletin No. 5 illustrating and describing some of the different types of recording meters and testing instruments which they have developed and perfected in recent years. In the introduction the application of the various types of meter is dealt with followed by a full description of each. The illustrations show interior, exterior and sectional views and also typical charts.

**Pneumatic Tools.**—Folder illustrating and describing an interesting line of pneumatic tools made by the Canadian Ingersoll-Rand Co., Montreal. The tools described include "Little David" drills and hammers "Imperial" air hoists and "Crown" sand rammers. The folder contains tables giving particulars covering each size of tool while the illustrations show them in operation, featuring their wide range of application.

The Webster & Perks Tool Co., Springfield, Ohio, have issued a new and attractive catalogue to the trade in which attention is called to the many improvements made in their line of horizontal threading, bolt pointing and special tapping machines. Each type of machine is illustrated and described together with a statement of the output, list of attachments and brief specifications. The concluding pages contain illustrations and particulars covering solid spring dies, die collars and holders etc. A table of speeds for cutting bolts and tapping nuts is included.

**Corliss Engines.**—The Hoover, Owens, Rentschler Co., Hamilton, Ohio, have issued two bulletins, Nos. 119 and 201, describing the series E heavy duty and series C box girder Hamilton Corliss

## Saving or Wasting?

The manner in which you handle the drinking water problem in your plant may seem to be a small matter to you—but investigate. The results will be surprising.

The old-time faucet is costly. Running hour after hour, day after day, its ceaseless flow is costing you money, yet without any better service.

### Puro Saves 35%

A Puro Sanitary Drinking Fountain will cut that water bill 35%. We can prove that it has done that for others.

It will give every employee a safe, saner draught of bubbling water free from the contamination of the common drinking cup.

In a word, it is the only sanitary Drinking Fountain that is really safe, sanitary, simple, automatic in control, and easy to attach.

## \$469.20 a Year for National Advertising

A half-page advertisement in MacLean's Magazine, every issue for a year (12 times), costs \$469.20.

Figured out proportionately, it means:

\$164.22 to influence	Ontarians,
\$102.00 " "	Quebecers,
\$23.46 " "	New Brunswickers,
\$28.15 " "	Nova Scotians,
\$4.69 " "	P.E. Islanders,
\$32.84 " "	Manitobans,
\$37.54 " "	Saskatchewanans,
\$28.15 " "	Albertans,
\$28.15 " "	British Columbians,
(This division on the basis of provincial populations.)	

Really, when you break it up this way, the amount per province for a whole year's powerful influence is ridiculously small.

Honestly, can you say "I can't afford \$469.20 a year for national advertising?"

## MACLEAN'S MAGAZINE

Can perform a service for you, at a price, which you cannot have rendered by any other single medium, or at so low a cost.

N.B.—Objectionable advertising not accepted. Both editorial and advertising columns are closely censored to keep them clean and decent.

engines. In each bulletin the various parts of the engine are illustrated and described in detail together with views showing installations. Bulletin 119 contains tables giving the dimensions, weights, and horse power of the various sizes of the series E type of engine.

**Manganese Steel Chains.**—Bulletin No. 171 issued by the Jeffrey Mfg. Co., Columbus, Ohio, deals with a line of manganese steel chains, sockets and attachments for elevators and conveyors for severe service in handling gritty or abrasive material. The bulletin is illustrated and also includes price lists for combination manganese and all manganese steel chains.

**The Limit System** is the title of a very attractive catalogue and booklet that is being distributed to the trade by the Swedish Gauge Co., of New York, through their Canadian representative, H. E. Streeter, 504 McGill Building, Montreal. This catalogue features the "Johanssen" combination standard gauges, setting forth the accuracy of construction and universal use to which this system of gauging can be adapted. It is claimed that the methods of manufacture are so exact that a guarantee of accuracy is assured to a limit of one hundred thousandth of an inch; and the extreme flatness of the surfaces permits two or more blocks to be used as one gauge, with the same degree of ac-

curacy as when using a single block. In addition to a brief description, a large number of cuts are shown, illustrating in a practical way the innumerable uses to which these gauges, either singly or in combination, can be applied. Several pages at the back of the book are reserved for illustrating and describing the "Johanssen" adjustable limit snap and plug gauges, and also a tolerance plug gauge.

## Book Review

**Central Station Management**, by H. C. Cushing, Jr., and Newton Harrison, 397 pages, 7½ in. x 4¾ in. Published by the D. Van Nostrand Co., New York. Price \$2.00 net. This is a new book dealing with the principles of central station management as adopted by many successful electric light and power stations in the United States. The various phases of the subject are discussed in a comprehensive and practical manner, emphasis being laid on the necessity of close attention to details; necessary for successful operation. Both the commercial and technical features of central station management are dealt with, considerable space being devoted to the question of rates and cost of power. Other subjects discussed include street and interior lighting, while one chapter is devoted to district heating from cen-

tral stations, in which it is shown how this can be done with profit. The book contains thirty-two chapters, of which twenty-five are devoted to management and distribution, while the remaining chapters deal in a general way with the power plant end of the subject. The book is not too technical, but contains much valuable information covering a subject full of important details, a careful consideration of each being essential to obtain satisfactory results. Another service the book performs is to show how central stations can be managed efficiently and at the same time with proper consideration of the public which it serves, thus establishing cordial relations between the producer and consumer; a desirable condition for a public service company to operate under. The book is printed in clear type and is bound in substantial cloth covers.

**CAREFULLY** follow the instructions for heat treating the particular brand of tool steel you are using. In many up-to-date shops, tools for cast iron, very hard iron, steel, cast steel, etc., are all treated differently, though they may be all of the same stock. A tool will generally work better and stand up longer if it has been ground down at least 1-32 in. after hardening. Never pass a tool tightly against the wheel when grinding. —Lodge & Shipley Manual.

# SIDNEY ENGINE LATHE

*A "Heavy Turning"  
Tool of Wonderful  
Accuracy*

**Some of the important features**

20 per cent. steel mixture in bed casting. Heavy carriage vee 2½ inches wide.

High carbon rack pinned and bolted to bed.

50-point carbon steel head stock spindle offset 1 inch off centres for heavy duty work.

40-point carbon lead screw 17-16 inch diameter, 2 pitch thread.

Let us tell you of the many other interesting details. Write for full particulars.

**THE SIDNEY TOOL COMPANY, Sidney, Ohio, U.S.A.**

## FOR SALE

16 H.P. IDEAL GAS ENGINE -- ALSO quantity of pulleys. Chipman & Millman, Brantford, Ont. (16)

6 1/2 H.P. WESTINGHOUSE AND 13 H.P. Toronto & Hamilton Electric Co. 60-cycle motors, in first-class order. Geo. H. Lees & Co., Hamilton. (17)

FOR IMMEDIATE SALE. TORONTO--3,000 feet seamless steel tubing, 1 1/2" O.D. by 5-32" wall. No reasonable offer refused. Box 227, Canadian Machinery. (15)

FOR SALE--2 2" MURCHEY COLLAPSIBLE taps for nosing shells; 1 No. 6 2" collapsible tap; maker, The Manufacturers' Equipment Co. McGregor & McIntyre, Toronto, Ont. (14)

FOR SALE -- STEEL WATER TOWER, without tank, 94 feet high. Will support tank holding 13,000 gallons. Cost new \$1,000.00. Will sell for \$350.00 f.o.b. Shawinigan Falls, P.Q. Northern Aluminum Company, Limited.

A SNAP IN TURRET LATHES SLIGHTLY used on shell work. Fourteen splendid machines at bargain prices. Do you need these machines? If so, drop a line to Box 953, Woodstock, Ont.

FOR SALE--ONE 2 H.P., 60-CYCLE Chapman & Walker motor, single phase, 110 volts, or will exchange for a 2 H.P., 25 cycle motor, 550 volts, three-phase. Address The R. S. Bickle Company, Woodstock, Ont. (14)

## For Sale Cheap

- 1--Box Girder Type Overhead Hand Power Crane, 48' 6" span, 5 tons capacity; complete, less the Hoist. This is a good Crane for Foundry, Boiler Shop, Storehouse, Stone Yard, etc.
- 1--12" Single "I" Beam Overhead Hand Power Crane, 30' 10" span, 3 tons capacity; complete, less the Hoist.
- 1--Brantford (Gas) Bake Oven and 4 Racks.
- 1--Linderman 2-Spindle Boring Machine.
- 1--26" Drill, London Machine Tool Company.
- 1--Bowler 40 Gal. Varnish or Oil Pump and Tank.
- 11--New 1-13/16" High Speed Twist Drills, No. 5 Morse Taper Shank.
- 30--Used 1-13/16" High Speed Twist Drills, No. 5 Morse Taper Shank.

**M. BEATTY & SONS**  
Limited  
Welland, Ont.

**BUSINESS FOR SALE -- MACHINE SHOP** with a good, steady run of work and always busy. A good opening for a young man to get into business. Owner has other interests. Box 224, Canadian Machinery. (12)

1--2-SPINDLE SHAPER, WOOD TOP, JOHN Ballantyne, Preston, make, used two months. 1 Dynamo, 45 lights, Toronto and Hamilton Electric Co. make. Used five months. Good as new. Box 195, Jordon, Ont. (R.T.F.) (14)

FOR SALE--ONE BROWN-BOGGS MARK- ing Machine, suitable for 6" Mark XVI. or Mark III. English Shells. Only object in selling is that other methods of marking have been adopted. Price on application. Taylor-Forbes Co., Ltd., Guelph. (14)

ONE REED TURRET LATHE, 8' BED, swing 28"; 4 2" holes in turret. This machine is in first-class condition and was only used on 3,000 shells. Is a very powerfully built machine and will bear fullest investigation. Box 226, Canadian Machinery. (16)

FOR SALE--ONE 16" x 8' HENDEY LATHE, with taper attachment, \$1,100.00; one 22" x 10' Blaisdell lathe, with taper attachment, \$1,300.00; one 24" Gould & Eberhardt shaper, \$800.00. The above machines are in first-class condition. For particulars apply Box 221, Canadian Machinery.

FOR SALE--BOILER REPAIR AND SHEET iron works. Fine opening, one of the best in Canada, for a good man. Only repair shop in county. Equipment alone will list at nearly \$2,000. Will sell for \$1,200. Write for particulars. Box 213, Canadian Machinery.

WE HAVE FOR SALE THE FOLLOWING equipment: Complete nickel and copper plating plant, including direct connected dynamo and motor; one second operation cast iron plug machine, and two first operation cast iron plug machines manufactured by the Brown Engineering Corporation; 2 16-inch turret lathes; 1 38-inch engine lathe, 20-foot bed. The above outfit will be sold en bloc or separate. Apply direct to Foundry & Machine Co., Ltd., Montreal. (12)

FOR SALE--McDOUGALL ENGINE LATHE, 20" swing, 10' bed; never been used. Baker Keyseater No. 2, good as new. Boring Mill, 2 bars, will bore up to 30" dia. Boston Forge Blower, 27", good condition. Crescent Swing Cut-off Saw, almost new. 7 1/2 H.P. Westinghouse D.C. Motor, in good order. Gurney Platform Scale, 3,000 lb., 16" wheels. Mandrills, Couplings, Hangers, Post Boxes, Pulleys, Belting, Cap Screws, Bolts, etc. Special prices on above, write for particulars. Winnipeg Machinery Exchange, Sutherland and Gladstone Sts., Winnipeg, Man. (14)

## PATENTS

THE PROPRIETOR OF LETTERS PATENT No. 143153, relating to "improvements in rails, especially tram-rails, for preventing the formation of so-called ripples," desires to dispose of the patent or to grant license to interested parties at reasonable terms, with a view to the adequate working of the patent in Canada. Inquiries to be addressed to Aktiebolaget Elasticitet, Gothenberg, Sweden. (14)

## REPAIRING

ALL KINDS OF MACHINERY REPAIRED, rebuilt and installed. W. H. Sumbling Machinery Co., 643 Yonge Street, Toronto, Ont.

## WANTED

Burned out Tungsten Lamps, late type, drawn wire, 25, 4), 60 and 100 Watts, 110 and 115 volts.

**DOMINION TUNGSTEN LAMP FACTORY**  
ST. CATHARINES, ONTARIO

## SITUATIONS WANTED

TOOL MAKER IN CHARGE DESIRES change. Competent to take charge of machine shop or tool room. Good references. Box 225, Canadian Machinery. (17)

SUPERINTENDENT--FIRST-CLASS PRAC- tical mechanical man is open for an engagement as works manager or superintendent. Can give best of reference as to character and ability to handle help and produce results. Box 227, Canadian Machinery.

ARE YOU LOOKING FOR A SUPERIN- tendent? There's money in making shells, if you know how. If you don't, let me make them for you, any size. I'm open for a contract with any concern that is looking for a live wire production Superintendent. Address Box 230, Canadian Machinery. (13)

## WANTED

WANTED -- 250-VOLT D.C. GENERATOR -- 75 to 150 k.w., direct connected to steam engine; must be in good condition. Write to The Kaufman Rubber Co., Berlin, Ont. (13)

WANTED TO MANUFACTURE A FEW lines of metal products, sheet metal preferred. We have complete equipment for high-class work. Give complete description and rating in first letter. Apply Box 221, Canadian Machinery. (17)

WANTED--12" BAR ROLLING MILL TWO or three high with steam drive. One three-ton Steam Hammer. One half-ton Steam Hammer. One pair Rolling Mill Shears. With full particulars and lowest price. Apply Box 218, Canadian Machinery.

FOREMAN FOR LARGE WINNIPEG MA- chine shop -- must be aggressive and mechanic with good practical experience in jobbing, stock and transmission work. When applying, state age, experience and salary expected. Applications treated confidentially. Box 229, Canadian Machinery. (16)

SUPERINTENDENT FOR 4.5 SHELL FAC- tory all equipped and tooling for 400 to 500 shells per day. Shipping since May. Must have ability to thoroughly organize, and be capable of producing maximum results in short time, and have previous shell experience. To the right man we will pay a liberal salary and bonus. State fully (in confidence) past experi- ence, present record and salary expected. Box 228, Canadian Machinery. (14)

The "HENDEY" Lathe

# The Service

## Capacity and Convenience

of a Hendey Lathe will prove of vital importance to your tool room.

The "Hendey" is accurate in the highest degree and suited for the efficient use of watch tool chucks, stop chucks, relieving attachments, etc.

It has the best spindle construction in its taper journals, with annular bearings and automatic oiling rings, which make for accuracy of alignment.

It has **automatic stop** for carriage working in either direction. Has reverse for carriage, controlled from apron.

Wide range of threads and feeds through mounted gearing, with ability to make gear changes for additional threads and feeds without limit.

**A card will get you full particulars. Why not mail it now?**

# The Manufacture of Russian 3 in. High Explosive Shells

Staff Article

*In the methods described herewith, simplification of operations has been carried to the logical extreme, accompanied by a generous disregard for close limits where these are not necessitated by later operations; strict accuracy in the fundamental portions of the work, however, is closely maintained—these two features combining to produce successful results.*

SOME time ago, considerable interest was aroused in munitions circles by the action of several firms in this country in declining the manufacture of Russian high explosive shells. The principle obstacle was stated to be the tapered bore called for in this design of shell, and in view of the probable difficulties which would be encountered in performing such an operation, the practical certainty of reduced output, and the opportunity for over-anxious inspectors to split hairs, the disposition of most makers to decline contracts was not altogether unnatural.

Fortunately for all concerned, the matter was finally settled by adopting a parallel bore and the production of shells for our "Ally of the Steppes"

is now being accomplished in a manner which is at once creditable to our manufacturers and gratifying to our friends. Many of our readers are thoroughly familiar with the manufacture of the British 3-in. H. E. shell, and although

the output of that particular shell has practically ceased, interest in the production of the corresponding Russian shell will be none the less keen on that account.

### Principal Features

The factory in which this work is being done has been engaged in produc-

An outstanding feature of the work is the simplicity of the tooling equipment. Of almost as great interest is the heat treating department and the methods in use there. In both of these matters there is considerable variation from familiar British practice. For instance, these shells are forged hollow instead of being drilled from the solid, no inserted base plate or gas check is used, and a special heat treatment given to insure not only the specified physical requirements as to strength, but also to impart a particular characteristic fracture to the metal when the shell explodes.

The compelled shell, ready for final inspection, is shown in Fig. 2, and the forging as received and also rough machined, is shown in Fig. 5. It will

be noticed that there is a considerable thickness of metal in the base of the forging which in conjunction with careful forging methods, insures a high degree of soundness to the base, the amount of metal to be machined off be-

FIG. 2. 3-INCH RUSSIAN H.E. SHELL.

ing these shells for several months, and it is to the credit of the staff that while the methods as a whole have reached a high degree of perfection, opportunities for further improvement are at present being turned to account.

FIG. 1. GENERAL VIEW OF MACHINE SHOP SHOWING LATHES ENGAGED ON FINISHING, GROOVING, ETC.

ing more than ample to remove any surface imperfections.

#### Base of Operations

As is the practice in most shell shops, the operations are arranged so that all prime cuts originate from the bore of the shell. Thus the forging is first of all placed on a plain taper arbor in a speed lathe and a centre-hole drilled in the base by a centre drill in the tail

FIG. 4. TOOL HOLDER USING SQUARE BITS ON END.

stock spindle. The arbor is hollow, so that the operator can slacken off the shell with a bar from the back end. No stoppage of the machine is necessary, as the pressure from the drill will cause the forging to grip the arbor sufficiently to do the work. Actual time from floor to floor for this operation averages 31 seconds. The cutting-off of the open end is done in three Davis cutting-off machines, with double tools. Interest attaches to this

FIG. 2. CUTTING OFF MOUTH, AND ROUGH-MACHINING BASE OF SHELL IN VERTICAL DRILLING MACHINES.

work through the use of a self-tightening chuck devised by the staff, particulars of which, along with other interesting devices, may be the subject of future reference.

#### Features of Roughing Work.

In facing the base down to roughing thickness, no attempt at accuracy is made, the principal requirement being to get the metal off quickly. Power for cutting and power for holding are both very necessary and are obtained in this case from heavy duty vertical drills of Colburn make, a battery of four being installed for this work; see Fig 3. The

tooling equipment is very simple, two flat cutters being fastened in the end of a plain cutter bar held in the drill spindle. The shell is supported internally on a rod which insures a uniform thickness of base when the drill spindle is fed down to the stop. A massive vise of rugged construction grips the shell between two vee-shaped jaws, which centre it approximately in line with the spindle. As long as the centre hole has sufficient metal around it the operation is satisfactorily accomplished. Ample lubrication is supplied to the cutters, enabling cutting to be done at the limit of power supplied.

FIG. 7. HEAT TREATING DEPARTMENT. ON THE LEFT SHELLS ARE BEING DRAWN FROM A HARDENING FURNACE AND QUENCHED IN CIRCULAR BATH. TOWARDS THE RIGHT, TREATED SHELLS ARE BEING TEMPERED IN EQUALIZING MACHINE.

In rough turning, which is now performed, the shells are driven by the mouth, which is carried on an automatic expanding driver, while the base is carried by the tail centre. Lathes of the plainest possible design are employed, including two Bawden 16-in. lathes, 1 Niles and 1 McGregor-Gourlay. The driver is of simple construction, being of the eccentric fluted type with rollers instead of rectangular dogs, as shown in sketch, Fig. 6. These rollers work very satisfactorily and allow the shell to be removed by hand quite easily.

#### Economizing Tool Steel

The problem of using high speed steel economically is satisfactorily solved by the type of tool holder used on these and other lathes in the machine shop. Fig. 4 is a sketch of this device, from which it will be seen that the strain of the cut is transmitted through packing directly onto slide rest, and as the

FIG. 3. UPPER, ROUGH FORGING BEFORE MACHINING. LOWER, FORGING AFTER ROUGH MACHINING.

tubes in the bar is the only tool used. The time for the complete operation, including handling, is 21 seconds, but

much of this showing is due to the design of chuck. A chuck of the type referred to is shown in Fig. 11, only in the case of the boring operation, a hinged pawl is mounted on the back of the rest

tion. The machine used is a Lodge & Shipley lathe, having a turret carriage and a special fixed cross slide, which carries the tool for forming the nose.

#### Heat Treating Process

As mentioned at the beginning of this article, heat treating is a necessary part of the work on this shell. The actual physical requirements are indicated in Fig. 2, and these may be attained by any desired treatment approved of by the authorities. What is not specified is the type of fracture most desired in action. As fragments of the shell possess death-dealing ability, as well as the

FIG. 5. TESTING TREATED SHELLS INDIVIDUALLY WITH THE SCLEROSCOPE.

tool is ground away, increased packing enables it to be used up to a very small amount. A cutting speed of from 40 to 60 feet per minute is maintained, according to the available pulley ratios. At this speed and with a feed of 1-16 in. per rev., the average time from floor to floor is approximately 3 minutes per shell.

FIG. 6. THREE-ROLL DRIVER FOR ROUGH TURNING SHELLS.

The interior of the shell is now rough bored, which brings the shape to the outline shown in Fig. 5. As in the case of previous roughing operations, the limits are liberal enough to allow maximum feeds and speeds without particular care as to extreme accuracy. An ordinary spade cutter on the end of a bar, and supplied with lubricant through

so that when the job is finished, the pawl automatically engages as the spindle is reversed, thus backing off the collet sleeve. When starting, the shell is simply inserted in the chuck against a stop at the inner end, and the lathe started up, whereupon the chuck tightens itself immediately, any further tightening necessary being caused by the cutters when brought into ac-

FIG. 9. TWO-SPEED LATHE EQUIPPED FOR FINISH BORING THE INTERIOR AND COUNTERBORING NOSE BEFORE THREADING.

charge of explosive, any treatment which will intensify the damage done by the fragments enhances the efficiency of the shell accordingly.

As the result of careful trials and exhaustive investigation, coupled with a suitable grade of steel, it has been found possible to impart what might be termed a high degree of ultimate brittleness to the metal while still retaining in ample degree, all the required physical properties, the result being that a maximum number of fragments are scattered when explosion takes place.

The actual operations involved in the treatment are very simple in themselves, and with the type of equipment in use, have yielded absolutely perfect results, not a single test shell having failed to yield the desired results either in laboratory tests or under actual firing conditions.

### Equipment

The heating equipment consists of two hardening furnaces, one tempering

FIG. 10. CUTTER USED FOR RECESSING NOSE BEFORE THREADING.

furnace, one equalizing machine, with the necessary quenching baths, pyrometers, etc. The photograph, Fig. 7, shows the entire equipment, the two large hardening furnaces at either side being specially designed and built to the firm's requirements. They are of the five-burner, oil-fired type, the burners being so arranged that an absolutely even temperature is obtainable throughout the

FIG. 13. GRINDING THE BOURLETTE AFTER FINAL TURNING OF THE BODY.

combustion chamber. In front of either furnace is a circular quenching tank with a constant flow of cooling water, and provided with racks which allow each shell to be maintained in a verti-

FIG. 11. THREADING THE NOSE OF SHELL WITH COLLAPSIBLE TAPS FITTED WITH SPECIAL PILOT BUSHINGS. NOTE OUTER SUPPORT FOR CHUCK ON LEFT.

cal position, with about  $1\frac{1}{2}$  in. projecting above the water level. Each heat consists of 35 shells which are brought to a temperature slightly over 1,500 deg. Fahr., in about half an hour, which, after allowing for drawing and filling, gives an average capacity of about 50 shells per furnace per hour.

### Equalizing the Treated Shell

The object of leaving the nose above water is to keep it fairly soft, so that no trouble will arise in threading the nose afterwards. In order to insure a perfectly even degree of hardness throughout the shell, they are now placed in a single-burner Mecol furnace and brought up to about 900 degs. Fahr. when they are withdrawn singly and immersed in the lead bath of the equalizing machine. This device, shown in the centre of the picture, consists of a lead bath surmounted by a framework

which supports a revolving disc carrying six spindles. The spindles are arranged to lift up clear of the lead so that a shell may be placed underneath and partially immersed in the lead. The disc is now revolved and the shell under the spindle removed and a fresh one put in place. The upper ends of the spindles are fitted with small planetary pinions meshing with a central

### Testing Results

The tempered shells are now allowed to cool naturally and for this purpose they are placed in special metal racks adapted for use with elevating trucks of the Chapman ball-bearing type, after

FIG. 12. FINAL SIZING OF THREAD WITH ADJUSTABLE TAP DRIVING BY SELF-REVERSING TAP HOLDER.

which a careful test is made on each individual shell with a scleroscope. For this purpose two spots are cleaned up on opposite sides of the shell, and all shells reading from 47 to 52 are passed as satisfactory. Owing to the methods employed, the difference between opposite sides seldom exceeds 2 points, thus testifying to the efficiency of the heat treatment.

### Finishing the Bore

The shells are now ready to receive the balance of machining operations, next in order being the finishing of the

bore and counterboring the nose to receive the thread. Uniformity of tooling and output was secured by installing a battery of six Bullard turret lathes, one of which is illustrated in Fig. 9. These

ferring to the illustration a collar will be observed on each bar next the supporting bracket on the turret faces. By means of a set screw on each side of the collar, two small cutters of square tool

the hub of the wheel engaging with projections from an internal rod which is thus caused to move lengthwise and expand the dogs by means of tapered portions on the rod.

Recessing is done on a small engine lathe in which a cutter of the section shown in Fig. 10 is carried on a short bar. The profile of the cutter is arranged to make a square face on the bottom side of the groove, and an angular face on the other, also, when fed in to the proper depth the edge of the square face is chamfered, thus removing the rag and preventing any interference with gauging work during inspection.

#### Tapping the Nose

The production of perfect threads on tough heat-treated steel is not an operation which can be rushed like rough turning and other preliminary work, and a record of one shell in less than a minute from each machine over a period

FIG. 14. FINISHING THE BASE ON A RING WHEEL GRINDER AFTER MACHINING OFF THE CENTRE.

machines are of specialized design, having the simplest form of carriage, ways, and feed mechanism, and possess but two speeds, the slowest one being brought into use when bottoming the bore and other similar limit work. The chuck is of the self-tightening type previously referred to, the steady rest which is fastened to the ways being seen in the illustration.

Three tools are used on this operation—1st, a roughing cutter, which brings the bore close up to size; 2nd, a single point cutter on a short bar, which counterbores the nose; 3rd, a finishing cutter of similar form to the rougher, for final sizing and bottoming. By re-

steel are held in position, which face off the open end to the required length. A period of five minutes provides ample time for the work, most of the time being spent on the finish boring.

#### Minor Operations

Before proceeding to tap the nose, two minor operations are performed, viz., cleaning out the centre for use in final turning, and recessing the bottom of the counterbore to clear tap. At present the former is done in a simple speed lathe fitted with an arbor having two sets of expanding dogs. The arbor is operated by a handwheel working on a threaded part next the lathe spindle.

FIG. 15. EXPANDING PLUG FOR SUPPORTING SHELL WALLS WHILE BANDING.

of days at a time speaks well for the thoroughness of the method, the efficiency of the equipment, and the care of the operator.

Two Davis turret lathes are employed and each machine is equipped with two Victor expanding taps. The method of using the taps calls for more than passing notice in view of the excellent showing made. Photograph, Fig. 11, shows the taps fitted with special pilot bushings. The first or roughing tap which faces the reader has a revolving bushing mounted on the end of the tap. When the second tap is brought into action for finishing, an extra long bushing is inserted in the shell, so that the maximum possible support is given to the pilot bar on the tap, thus insuring a concentric thread. The illustration shows this bushing on the tap as it is

FIG. 16. BANDING DEPARTMENT, WHERE COPPER BANDS ARE ASSEMBLED, PRESSED AND MACHINED.

withdrawn from the shell. The actual time for complete operation, including handling, is 57 seconds, while final sizing is done by an adjustable tap with similar pilot bushing, the latter operation being done in a Colburn drill fitted with an Errington friction drive reversing tapper. The shell is held in a split vice, with cam-lever tightening device, the whole arrangement being shown in Fig. 12.

### Body Turning

The sockets, or nose-pieces, are now assembled. Every care is taken to secure perfect fitting joints, and adjustment by filing is occasionally done so as to insure the joint being imperceptible after machining. A preliminary cut is now taken over the body and profile with the shell driven by a threaded arbor, and support by a centre in the tailstock. Owing to the increased hard-

tired by a cup, and driven by a pin engaging one of the wrench holes, shown in Fig. 2, while the base centre is supported by the tailstock.

The centre is next faced off, the radius formed, and the base accurately squared up. The latter operation is done on a Gardner disc grinder, the time occupied being a matter of seconds according to the amount of grinding required. The shell is slipped over an arbor hinged to bracket mounted on the work table. With the work table drawn back from the wheel, the arbor and the shell are tilted over to a horizontal position, resting in a vee-block which holds the shell perpendicular to the face of the grinding wheel. A slight horizontal pressure by the operator's left hand, combined with a vertical motion, causes the shell to oscillate across the face of the grinding wheel, while, with his right hand, the operator revolves the shell

shell in the chuck, throw in the friction drive on the spindle pulley and start cutting, a fair average time per band being 20 seconds, including handling.

### Inspection and Shipping

After final shop inspection the shells pass through the hands of Russian Government officials, being finally oiled and fitted with steel shipping plugs. The shipping boxes hold six shells each, are of dovetailed construction, and lids fastened by six heavy wood screws. The two centre screws on each side are sunk well beneath the surface, forming a cavity which is filled up with a special sealing wax. An electric soldering iron is used for this work, the view in Fig. 17 showing these final operations, while in the immediate background can be seen the Government inspection department, from which oversight of shipping operations can be conveniently maintained.

FIG. 17 CLOSING AND SEALING LIDS OF SHIPPING BOXES AFTER GOVERNMENT INSPECTION.

ness of the metal, it is not possible to work at the previous speeds, about 25 feet per minute being the average on this work, which allows of a complete cut being taken in  $3\frac{1}{2}$  minutes. Ordinary engine lathes are in use with suitable profiling attachments. The final turning is now done on another group of lathes similarly equipped, which machine the shell so that it has a peculiar increase in diameter at the front end known as bourlette, or forward land, as it is sometimes termed. The body of the shell may have a smooth tool finish, but the bourlette and the nose must have a smooth finish, preferably by grinding.

### Final Machining Operations

Grooving, undercutting and knurling are next performed on two groups of engine lathes, the knurling being in the form of horizontal lines across the bottom of the groove. The bourlette is next ground on a Symington grinder shown in Fig. 13. Simplicity and rigidity are features of this tool, which, with the use of suitable driving devices enables the complete operation to be done in 49 seconds. The nose of the shell is cen-

slowly thus securing a smooth, flat, and square base, ready to receive the various markings before being banded.

### Banding Operations

The various operations connected with banding are conveniently grouped together and a view of this department is shown in Fig. 16. In order to prevent any permanent reduction of diameter due to the pressure of the banding press, a supporting plug is inserted in the shell after removing the socket. This plug is collapsible after the manner of a spring collet and is expanded tightly against the wall back of the band; see Fig. 15. Banding equipment of the West Tire Setter type is employed, a three-throw belt-driven pump supplying oil at the necessary pressure. Immediately after banding, the sockets are replaced with oil on the joint, and the shells passed over to the band-turning machines, which are of Jencks type, fitted with a special chuck made in the shop tool room. This chuck is self-tightening and has a hand wheel with considerable shake, which is used for slacking-off. Thus it is only necessary to place a

### NO TRADING WITH ENEMY

TRADE figures for the calendar year ended with June 30th, contain \$48,215 worth of "imports from Germany," as against \$2,293,837 for the preceding twelve months. As it is forbidden to trade with the enemy, these figures are of interest. Inquiry at the Customs Department elicits the information that a large proportion of these imports are excise warehouse entries, and consist of tobacco, cigars and beers which were in warehouses before the war, and have only recently been entered for consumption. A few other items, including toys, manufactures of jute, jewelry, carboids, etc., were purchased before the war and delayed in transit in some neutral country. No goods are reaching Canada from Germany direct at the present time.

Heavy exports of nickel from Canada to the United States are explained by the fact that every ounce of nickel mined in Canada is refined in New Jersey. In the year ended June 30, Canada exported \$6,180,998 worth of nickel to the United States, while only \$1,689,012 worth went to Great Britain. There is an increase in nickel exports of nearly \$2,500,000 over the previous fiscal year.

### IRON ORE EXPORTS FROM NEWFOUNDLAND

IRON ORE exports from Newfoundland for the fiscal year 1914-15 were 511,990 tons, of which 17,500 tons went to the United States, 382,260 tons to Canada, 41,300 tons to Holland, and 69,930 tons to the United Kingdom. For the fiscal year 1913-14 the total exports were twice as much, or 1,245,797 tons. The United States received 170,590 tons of this total; Canada, 785,245 tons; Holland, 122,332 tons; Germany, 51,790 tons, and the United Kingdom, 115,840 tons.

# Manufacturing and Power Equipment of a Shingle Mill

By A. F. Menzies

*Despite the fact that our readers are more or less familiar with the appearance of and the many purposes for which shingles find a ready market, few, beyond the districts in Eastern and Western Canada where they are produced in enormous quantities, may be said to be informed as to plant and equipment requirements for their manufacture. The accompanying article sheds considerable light on these features and incidentally gives prominence to an extensive and valuable Canadian industry capable of still further development.*

**T**HE Shull shingle mill, situated on the north arm of the Fraser River in the municipality of Burnaby, is reputed to be the largest of its kind in existence. The site occupied is approximately 12 acres. The entire mill is devoted exclusively to the sawing of cedar shingles, which are shipped via the Brit-

a power plant of considerable capacity. In this case the designer should be complimented on providing a generous supply, which is not always done. All lumbering operations are attended with considerable waste of timber, sawdust being also produced in great quantities; the latter is almost always used as fuel un-

house, situated about 39 feet from the mill building. The boilers are in brick settings with "Dutch Ovens," and the fuel is fed automatically to the fire holes by chutes from the conveyor, which brings it from the mill.

Fig. 2 is a photo of the stokehold and shows the chutes which lead to the fire holes. The platform, beyond the "Dutch Ovens," consists of steel plates carried on 6 in. I beams, spaced 30 in. centres. The smoke boxes of the boilers are connected by a breeching to the 6 ft. by 100 ft. steel stack, the top 20 feet of the latter having a spark arrester screen. The boilers, uptake and stack were constructed and supplied by the Vulcan Iron Works, New Westminster. A large bin, 12 ft. by 54 ft., is provided at the back of the stokehold for storing a supply of waste timber for use at nights and at other times when the mill is not running and no sawdust is being produced.

## Boiler Feed Arrangements

Feed water from the Fraser River is stored in a 40,000-gallon settling tank, located outside the boiler house, and is drawn from the tank by a 7½-5-6-in. Worthington duplex boiler feed pump. The feed is delivered to the boilers through a Reilly-multicoil feed water heater, supplied by the Canadian Griscorn-Russell Co. The heater is located in the exhaust line from the main engines and delivers the water at about 220 de-

FIG. 1. GENERAL VIEW OF PLANT FROM TOP OF DRY KILNS.

ish Columbia Electric Railway, a spur track from that company's line between New Westminster and Eburne, running alongside the shipping shed. Connection is available at New Westminster for transfer to several transcontinental railways. Being on the river bank, water transportation is available for the delivery of logs and shingle bolts to the mill.

The mill itself was designed by Mr. Lustig, of the Sumner Iron Works, Everett, Wash., which concern supplied a large portion of the machinery installed. Construction was carried out by the owners and was under the supervision of F. W. Tahmadge. The total cost was in the neighborhood of \$150,000, and the twenty shingle machines now installed are giving an output of 600,000 shingles per day of 10 hours. Space has been left on the manufacturing floor for four more machines which will bring the capacity up to 720,000 per day. Fig. 1 gives a comprehensive view of the plant as a whole, the dry kilns excepted, the photo being taken from the

A mill of this size naturally requires top of them.

der the boilers. Steam is supplied by four 72 in. by 18 ft. return tubular boilers, which are allowed a working pressure of 160 lbs. per sq. in. They are located in a semi-fireproof wood boiler

FIG. 2. STOKEHOLD OF POWER PLANT.

grees F. The feed regulating valves are provided with extension spindles, to enable them to be operated from the front of the boilers. A 2 in. Penberthy injector is provided as a stand-by for boiler feeding purposes.

#### Steam Piping

A 12 in. by 38 ft. steam header runs the length of the boiler room, and is connected to each boiler so that any one may be cut out without affecting the remainder. The header is constructed of extra heavy pipe and fittings, and was designed and built by the chief engineer of the plant. The main steam line, 9 inches in diameter, is taken from one end of the 12 in. header, and is provided with an extra heavy swivel expansion length, constructed by the Vancouver Engineering Works, Vancouver. Two  $3\frac{1}{2}$  in. steam lines are taken from the header—one to the dry kilns and the other to the underwriters' fire pump. The former line is about 350 feet long, and can be seen, supported on wooden "A" frames, in the foreground in Fig. 1. All the steam pipes are covered with asbesto-cel pipe covering, supplied and put on by the Vancouver branch of the Canadian H. W. Johns-Manville Co. Where exposed to the weather, the pipe insulation is protected by an additional waterproof cover. Crane Co. valves and fittings have been used exclusively in the pipe work, the Crane "Navy" valve being in evidence in all important places.

#### Engines and Generators

The mill drive is provided by two 18 in. by 20 in. twin horizontal, balanced

ant bearings. The engines are set side by side, but facing opposite directions. Fig. 3 shows one of the engines, with part of the flywheel of the other showing on the extreme left. The engine foundations are of concrete, poured round closely spaced piling. The ground

pounded for 110 volts at no load, and 115 volts at full load.

#### Fire Protection

Fire protection is provided for by a 16—9—12 in. duplex Underwriter fire pump, built by the Canada Foundry Co., Toronto. This pump is kept running

FIG. 4. SHOWING THE TWENTY SHINGLE MACHINES.

in the locality is of alluvial formation and bedrock too far down to reach, therefore, piling was the only method available, and the concrete monolith was given a very wide base to increase the bearing surface. The engines are each fitted with a double arm band wheel, 8 ft. in diameter, and of suitable width for the 30 in. driving belts.

A separate electric generating system is provided for lighting the plant. The generator is a 15 kw. machine, built by

constantly to ensure a certain supply of water at the various hydrants located at suitable places in the mill buildings and at strategic points on the mill site. The 10 in. suction pipe from the fire pump is led into the river, the lower portion being on a float, which keeps it off the river bottom, and which rises and falls with the tide. The movement of the pipe is procured by a ball and socket joint. The 8 in. discharge is placed underground, risers being provided at the hydrants. Besides fire duty, this pump is utilized to keep the settling tank supplied with feed water for the boilers, and also to supply the shingle saw water jets.

#### Driving Belts

The driving belts in the mill were supplied and installed by the Western Oil & Supply Co. of Vancouver. Some of the principal items under this heading are:—Two main drives, 30 in. by 2-ply "Amphibia" leather belt, one 110 feet and the other 61 feet long; 506 lineal feet of 10 in. by 5-ply balata belt on miscellaneous drives; 793 feet of 8 in. by 5-ply on drives to the shingle machines; 1,144 feet of 5 in. by 4-ply on the drives from the shingle saw arbors to the countershafts, and from the latter to the jointer saw arbors. These latter show prominently in Fig. 4. The leather belting was made by Sadler & Haworth, Montreal, and the balata by Jas. Dawson & Sons, Lincoln, England. Practically all the belting is made endless, being taken up automatically by weighted tightener pulleys.

#### Mill Equipment

The mill proper occupies a two-floor building, 200 feet wide by 72 feet long, the upper storey, occupied by the shingle

FIG. 3. ONE OF THE TWIN 18 IN. X 20 IN. MAIN DRIVING ENGINES.

valve engines, of Sumner Iron Works make. These prime movers turn up 190 r.p.m., and develop 440 horse-power each. They are provided with "Gardner" throttling governors, and eight-feed lubricators are fitted on all import-

the Three Rivers Electric Co., Mich., and direct coupled to a twin single acting enclosed steam engine running at 500 r.p.m. The engine was supplied by the U. S. Rapid Fire Gun & Powder Co. of Derby, Conn. The generator is com-

machines being 40 feet wide. The building is of heavy timber construction, and is carried on a pile foundation. The end of the mill nearest the river has three haulways extending down into the water, two of the haulways being equipped with 9 in. by 1¼ in. chain, with flight attachments, and used for hauling up the cedar logs. The other haulway is used for shingle bolts, of which a considerable quantity are used. The log haulways lead to two 84 in. swing cut-off saws, which cut the logs into 16 in. or 18 in. lengths, depending on the size of shingles being made. After being cut off, the discs of timber are split into pieces of suitable size on two power-feed bolters. The timber is then known as "shingle blocks." To remove all sapwood and other defects, two knee bolters are used. These machines consist of a circular saw and a table on rollers, the latter having a projecting arm, which is held between the knees of the operator, hence the name. The shingle block is manipulated by hand and the table moved up to the saw by a motion of the knees.

When the blocks have been properly prepared by the knee bolter they are dumped into a conveyor, which takes them up to the machine floor. The conveyor travels the full length of the floor and the blocks are taken off and stacked on tables beside the shingle sawyers. Fig. 4 shows the machine floor, with the block conveyor running down the centre, and the ten shingle machines on each side. The shingle machines are all of Sumner Iron Works design and construction, and are equipped with their latest set equipment, which has a graining attachment to enable, if required, shingles to be taken off the block, butts up or down, instead of alternately up and down. This attachment is a great timber saver, as by its use the sawyer can keep a knot in the tip of the shingle, where it does no harm. As fast as the shingles are sawn from the block the edges are trimmed on the jointer saw and thrown down a chute to the packers.

The shingle packers are situated in the wings of the lower floor. The shingles are packed by hand into the machines, and, when a full bundle has been packed, are drawn down tight by means of a lever, which is held in a catch until the bands, consisting of two strips of wood and two strips of galvanized iron, are nailed on. The bundles are then removed and placed on conveyors, which take them to the dry kilns. The open-air portion of these conveyors can be seen in Fig. 1, where several bundles of shingles are shown en route.

#### Heating and Drying

The output of the mill is dried in four dry kilns, each 120 feet long by 21 feet wide. Each kiln has three tracks of light rails running clear through it.

and extending beyond at each end. At the entrance end the bundles of shingles are piled on trucks in such a way as to permit a free circulation of air among them. The trucks are run into the kilns, where they remain about ten days, gradually working down to the lower end as those ahead of them are removed. The heating of the kilns is provided for by 10,000 feet of 1¼ in. pipe in each, in which steam is circulated. The steam is admitted to a header, located a short distance from the "wet" or entrance end. From the header the 1¼ in. pipes run to a similar header at the other end. Provision is made for the expansion and contraction of the piping, under a variation of temperature, and also for inequalities in length, by having, on the end of each run of pipe, an 1¼ in. by ¾ in. elbow, the connection to the header being made by a ¾ in. nipple threaded right and left-hand, and about 2 ft. long. The heating pipes are laid on a slight grade, and all condensation runs to the outlet header, from which it is trapped by four "Stoney" steam traps. The dry kilns were put in by the North Coast Dry Kiln Co., and the doors are of

loose when removed from the kilns. After being pressed up, the bundles are run into waiting cars on gravity conveyors.

#### Shafting and Conveyors

To return to the mill building, the centre 40 feet of the lower floor contains the two main line shafts, each of which is driven by its own engine. The shafts are 5 inches in diameter where the power is received, being reduced in size as it is taken off. They extend the full length of the building. Between the shafts there are three conveyors, two for sawdust and one for spalt. These conveyors receive the sawdust and spalt through chutes from the shingle machines which are directly above on the upper floor, and discharge into two others running at right angles, one of which takes the sawdust to the stokehold and the other takes the spalt to the burner. Fig. 1 shows these conveyors running on an up-grade from the mill to their destinations. The spalt conveyor runs through the bin at the back of the stokehold and a supply of spalt is maintained in the bin by setting a tripper to throw the blocks off.

FIG. 5. SAW REPAIR AND FILING ROOM.

their special design. The temperature of the dry kilns is kept as nearly as possible between 185 and 195 degrees F., and is separately recorded for each kiln by a Bristol recording thermometer, having seven-day recording charts.

At the lower end of the kilns a large loading shed is provided, in which is a transfer track and car. By this latter means the loaded dry kilns trucks, on removal from the kilns, can be transferred to any loading berth desired. Two steam shingle presses, by Webb & Gifford, of New Westminster, are used in the loading shed to press the shingles in the bundles up tight. Naturally the trip through the kilns dries them out, and although the bands were tight on the bundles when packed, they are quite

The burner, shown on the left in Fig. 1, is of steel with a brick lining; it is 28 feet in diameter and 80 feet high, with a spark arresting dome, 20 feet high on top. The burner is on a concrete foundation, and is kept busy all the time the mill is running, consuming the refuse.

#### The Saw Feature

The business end of the mill, the saws, were all supplied by the Vancouver branch of the Henry Diston & Sons Co. The outfit comprises: Sixty 40 in. shingle saws; forty 38 in. jointer saws for use on the shingle machines, there being three shingle and two jointer saws provided for each machine; four 86 in. inserted tooth cut-off saws; three 66 in. inserted tooth splitter saws; two 56 in.

inserted tooth cut-off saws, and three 52 in. knee bolter saws.

To do good work, saws must be kept in first-class shape. Their upkeep is attended to in a filing room on the same floor as the machines. A convenient system of getting the saws into the filing room is utilized. A series of pigeon holes opening into the filing room, and also into the machine room, are built into the dividing wall. A dull saw can be placed in its proper pigeon hole from the machine side, and withdrawn by the filer into the filing room when he is ready to attend to it. Similarly, a sharp saw is put in from the filing room side and withdrawn from the machine side. The filing room was equipped by the Henry Disston Co., and is supplied with two No. 55 and one No. 35 Covell automatic saw gummers. These machines are shown in Fig. 5. A large automatic saw gummer is located on the log floor and is used for sharpening the 86 in. cut-off saws, an overhead traveller being provided to bring the saws to the gummer and return them. Power for the filing room is preferably independent of the main engines. In this case a small vertical engine, manufactured by F. X. Bertrand, St. Hyacinthe, Que., and supplied by the Canadian Fairbanks Co., is installed.

The plant is operated under the supervision of Superintendent T. O'Connell; the steam end being in charge of F. G. Phillips, chief engineer, assisted by J. Anderson, second engineer.

### CONTINENTAL SHIPBUILDING AND SHIPPING DEVELOPMENT

SHIPBUILDING and shipping continue to experience real boom days in all the neutral countries of Europe and shipyards are being constructed in many hitherto practically unknown locations. A review of the present state of affairs is published in *Engineering* which states that old shipyards are being extended and new ones formed, shipping companies are being started almost every day, old concerns increase their capital, vessels keep changing hands at fabulous prices, and harbor extensions to accommodate this new traffic are the order of the day.

In Holland, throughout Scandinavia, and in other countries, shipbuilding yards are provided with work for years to come, and new concerns are being started under the best possible auspices. At Kallundborg, in Denmark, a new shipbuilding company has just been formed. The corporation is filling up a portion of the fjord and letting the area for building purposes to the new company for a period of 50 years, and a floating dock will also be constructed. A large new local shipping concern, started for running sailing vessels, has decided to have six steamers, of 2,000

tons each, built at the new yard, and in their fleet six large sailing vessels are to have motors installed. Not the least interesting feature in the present feverish movement is the revival of the sailing ship. But many authorities are extremely sceptical as to the future of the sailing vessel and discourage its renaissance.

### Sweden

Swedish shipping concerns and Swedish yards are equally well employed. The largest steamer so far built in Sweden has just been launched at the Gota yard, Gothenburg. It is the Skagern, with a capacity of 8,000 tons, ordered by the Swedish Transatlantic Steamer Company, and intended for Australian trade. The keel was laid on January 5, 1916, and the boat is expected to be ready about November. A Swedish consular report urges the desirability of cultivating the Australian traffic, since the United States and Japan are doing their best to develop their direct connections with Australia. Another Swedish shipping company which is greatly extending its fleet is that of the Nords German, which has six motor vessels in course of construction in Copenhagen, each of 6,450 tons, and three motor vessels in Gothenburg, each of 9,200 tons. The new vessels are intended to increase the company's traffic to Brazil, La Plata and on the Pacific Coast. Sweden has, on the whole, shown much enterprise and initiative of late years in extending her overseas shipping, and the value of her exports overseas, to Asia, Africa and America, rose from 13,570,670 kr. (\$3,800,000) in 1905, to 44,692,275 kr. (\$12,500,000) in 1913. The Swedish Government is also assisting shipping by loans and other ways, and is contemplating serious endeavors for keeping the North Swedish ports open beyond the usual time when ice stops the traffic. A number of ice breakers are being built for that purpose, and an expenditure of 25,000,000 kr. is considered necessary in order to keep shipping going for an extra month beyond the usual time.

### Harbor Activity

Larne new harbor works and extensions are going on or approaching their realization in all three northern kingdoms. The plan for the Malmo free harbor has now been finally drawn up, and is calculated to entail an expenditure of 9,360,000 kr. (\$2,610,000). The area for the free harbor is situated to the north-east of the present harbor, and the entrance is to be through the present inlet, 80 m. broad, by way of the eastern channel, both of which are to be deepened to 9.25 m. (30 ft. 4 in.). The basins of the new harbor are to have the same depth, and will comprise an outer harbor, 80-200 m. broad and about 400 m. long, and a basin east of the for-

mer, 100 m. broad and 500 m. long. The water area will be 33 acres and the land area 83 acres, the length of quay being 1,860 m. (6,200 ft.). All the quays are to be built of concrete, faced with granite. There will be one stationary 25-ton crane, and seventeen 5-ton movable cranes.

In Norway, the question of a free port is also to the fore, and of late Stavanger has come into prominence as the most favorable position, with convenient access from the sea, entailing very little loss of time. Further, Stavanger is at no great distance from the large English coal mining districts, and it is conveniently located for transit, both to other Norwegian ports and to Archangel and the Baltic. Norway's largest dry dock is at present being constructed at Stavanger, and additional railway facilities will establish connection between Stavanger and Christiania.

### Russia

Russia, in spite of the war, is exerting herself in no small degree to meet the after-war competition in shipping. Russian yards, both on the Baltic and the Black Sea, have been considerably extended during the war, in addition to which a large new shipyard is being constructed on the Murman coast. The Russian steamer companies, however, have not confined themselves to the home yards in the matter of new ships, having placed orders both with Swedish and Norwegian yards, in the same way as vessels are being built for Russian account in Japan, both at the Osaka yard and the Kawasaki yard.

Holland has no doubt materially improved her merchant navy during the war by selling old vessels and building new in their place, at the same time as the Dutch yards have built a number of vessels for foreign account. As in other countries, an improvement of harbor and canal facilities has followed in the wake of the shipping boom. The course from the Hook of Holland to Rotterdam is to be or is being enlarged. There will be constructed a third Ymuiden lock, and the waterway from Ymuiden to Amsterdam will be widened and deepened so that the biggest steamers may get as far as Amsterdam.

### READER'S QUERY

By F. L. L.

IS there a simple method whereby without the use of a slide rule, it is possible to find the value of  $x$  and  $y$  in the equation:

$$A = B \times x \times y$$

The values of  $A$  and  $B$  are known and the ratio of  $x$  to  $y$  is as  $3\frac{1}{2}$  is to  $2\frac{1}{4}$ ?

# Machine Shop Equipment, Methods and Processes \*

By E. R. Norris \*\*

*Since recent events have demonstrated so strikingly the reliance which must be placed by a nation on its engineering industry as a factor in modern warfare, the subject of the above title assumes a place of importance not previously awarded it by people in general. While not dealing specifically with munitions or other similar product, the application of the principles and information contained therein may be done with profit in all branches of engineering*

**M**ANY important developments in machine shop equipment and practice have occurred recently, and while it is possible to collect and review only a few of these in the space allotted to this article, the few examples presented may be considered as fairly representative of the progress, and may, in a measure, indicate present trend of development.

It is about fourteen years since Messrs Taylor and White discovered the special treatment which gave the world high-speed steel, and while it was early predicted that the use of this steel would revolutionize machine tool equipment and method of manufacture, it naturally took some time for machine tool builders and users to fully realize the changes which had to be made in equipment and methods, in order that the demands of the new steel might be met in an efficient manner. The greatly increased feeds speeds and depths of cut, which were possible by the use of the new steel made it necessary for the builders of machine tools to redesign their tools along heavier lines, with greater pulling power, and later to equip the machines with quick changing and automatic or semi-automatic attachments to facilitate the handling between cuts.

## High-Speed Steel Introduced Gradually

The large manufacturers had to be particularly careful in adopting high-speed steel when it was first introduced, his equipment not being suitable for its economical use; also, having a large stock of carbon and mushet steel tools, it was reasoned, and rightly so, that the change to high-speed steel must be made gradually. The new steels also made it possible for the machine operators to increase their productive capacity without an equivalent effort on their part, and it naturally followed that time and money values on work had to be adjusted to meet the new condition. Shops working under the premium plan of payment, or similar systems having a sliding scale of pay depending on the time taken to perform work, were in a position to adopt the new steel in many cases before values

were adjusted to meet the new conditions. Under piece work or similar systems of payment, however, it was absolutely necessary to promptly adjust the price paid, in line with the savings in time made with the new steel, and there is no doubt that this fact, in a great many cases, retarded considerably the general adoption of the steel. During the period between 1898 and 1900, Messrs. Taylor and White discovered and developed the process of treating tools made from chromium-tungsten steels; and while shortly after this time it was generally known that steel of this kind heated nearly to the melting point would do considerably more work, comparatively few took full advantage of the steel until Mr. Taylor's paper "On

interested in the subject, and, as a result, many varieties of the tungsten-chromium steels were rapidly placed upon the market by both home and foreign producers. The so-called "air hardening" steel, introduced by Robert Mushet about the year 1870, contained the essential elements of a high-speed tool steel, and required only the special treatment discovered by Messrs. Taylor and White to improve the high speed cutting qualities. Considerable development was necessary, however, before the high cutting speeds and durability, which are common to-day, were rendered possible. The annexed table indicates some of the changes which have been made in the chemical composition of high-speed steel up to the present date:

	Tungsten	Chromium	Carbon	Manganese	Silicon	Phosphorus	Sulphur	Molybdenum	Vanadium	Cobalt	Nickel	Copper
Mushet (Air hardening) ..	5.441	0.398	2.150	1.578	1.044

the Art of Cutting Metals" was published in 1906. This paper created a profound and world wide interest in steel; and while the paper dealt only with the results obtained with forged cutting-edged tools of lathe and planer types, its value was well known, and the new steel was rapidly substituted for the steels which were being used for drills, milling-machine cutters and other kinds of cutting-edged tools.

Before entering into a detailed discussion of these matters it may be well to state for convenience the subject matter has been arranged in four groups, which will be taken in the following order:

- Special alloy steels and Stellite
- Machining with edge tools
- Grinding
- Electric driving for machine tools.

## Special Alloy Steels

The composition of special alloy steels their treatment, application effect on machine shop practice.

Shortly after the publication of the paper, "On the Art of Cutting Metals," many steel manufacturers became highly

While this research and development finally benefited the user, he was at first involved in considerable expense in efforts to select, from the many brands available, the best steels to use for different purposes. The following investigation is typical of the tests which were carried out by users at about that time.

## Many Steels Tested

Twenty different brands of tool steel—ranging in price from \$0.38 to \$1.00 per pound (\$0.84 to \$2.205 per kilogram)—were selected and tested in order to determine which kinds would be the most efficient for the work in hand. From each brand of steel, tools were forged, hardened and ground under the direction of a specialist. The heat treatment was carried out in accordance with the steel manufacturers' instructions, and standard cutting angles and shapes were closely adhered to. The tools were first tested on axle-steel shafts, containing approximately 0.45 per cent. carbon, at a cutting speed of 103 feet (or 31.39 meters) per minute, the feed being 1.40 of an inch (0.634mm) and the average depth of cut 5-32 of an inch (3.97 mm).

\*A paper presented at the International Engineering Congress at San Francisco, 1915.

\*\*Director of Manufacturing Operations, Westinghouse Electric & Mfg. Co., East Pittsburgh.

A stream of cutting compound was directed on the tool. It is interesting to note the wide variation in the amount of work done by the different kinds of steel. Fig. 1 shows that the tool giving the best performance removed 570

tools formed by welding tips of high-speed steel to low grade carbon steel shanks. The electrical welding process as applied to work of this kind is quite successful. A very important consideration, however, is the one of relative cost

of each tool, shows that the final costs of the solid tool, the butt-welded tool and the welded tip tools are \$ 8.04, \$8.67 and \$9.17 respectively. It may appear, at first sight, that the allowance for salvage on the solid tool is high, but when

FIG. 1.

FIG. 2.

cubic inches (9336 cu. cm.) of metal for each grinding, whereas the tool at the bottom of the list removed only 38 cubic inches (622 cubic cm) of metal per grinding. Three tools were made from each kind of steel, and the best result from each set of tools was recorded in the chart.

A second test was made on malleable cast iron spiders, which, having four ribs each, provided an intermittent or broken cut, thus giving the tools a more severe test than would have occurred had the cut been continuous. A cutting speed of 55 feet per minute (16.73 metres per minute) was used on the first four spiders; this was increased to 60 feet (18.29 metres) per minute on the next four spiders, and a speed of 65 feet per minute (19.81 metres per minute) was maintained on all subsequent spiders until the tool was ready for regrinding. In all cases, 1-12 inch (2.12 mm). feed was used, and the average depth of cut was 7-32 inches (5.56 mm). Fig. 2 shows the amount of metal removed for each grinding of the various tools; the symbols shown on the curves were for purposes of identification of the steels used.

#### Reducing Initial Cost of Tools.

Superior grades of high-speed steel, though of high efficiency from a cutting standpoint, are often rejected on account of the high cost of the investment. Tool holders reduce this investment to some extent, however, but their use is somewhat limited owing to the fact that in many places a solid tool can be manipulated to greater advantage.

From time to time, various tests have been made on butt-welded tools and on

of solid and welded tools. To illustrate this point, consider a  $\frac{3}{4}$  in. by  $1\frac{1}{2}$  in. (19.04 by 38.1 mm.) round-nosed lathe tool made, first, as a solid high-speed tool; secondly, from low grade carbon steel shank with two inches of high-speed steel butt-welded on same; thirdly, from carbon steel shank with small high-speed steel tipwelded on. Reference to annexed table will show the first costs of solid, butt-welded and welded tip tools to be \$2.74, \$1.08 and \$0.80 respectively, the figures being based on high-speed steel at \$0.60 per pound (\$1.32 per kilogram).

**Solid Tool**— $\frac{3}{4}$  x  $1\frac{1}{2}$  x 12 in. long (19.05 by 38.1 x 304.8 mm.)—  
Cost of first tool .....\$2.74  
Six additional reforgings and hardenings 1.20  
70 additional grindings ..... 5.17

Total cost during life of tool ..... 9.11  
Salvage ..... 1.07  
Net cost .....\$8.04

**Butt-Welded Tool**— $\frac{3}{4}$  x  $1\frac{1}{2}$  x  $8\frac{1}{2}$  in. Carbon Steel (19.05 x 38.1 x 216 mm) 3 Pes.  $\frac{3}{4}$  x  $1\frac{1}{2}$  x 2 in. (19.05 x 38.1 x 50.8 mm) H.S.S.  
Cost of first tool .....\$1.08  
Two additional pes. of high-speed steel. .80  
Preparing for and welding (2 welds)..... .46  
Six additional reforgings and hardenings 1.20  
69 additional grindings ..... 5.17

Total cost during life of tool ..... 8.71  
Salvage ..... .04

Net cost .....\$8.67

#### Welded Tip Tool—

Cost of first tool .....\$ .80  
Six high-speed steel tips ..... 2.04  
Preparing for and welding (6 welds)..... 1.20  
69 additional grindings ..... 5.17

Total cost during life of tool ..... 9.21  
Salvage ..... .04

Net cost .....\$9.17

Thus the initial outlay for the solid tool is considerably greater than that for the welded tip tool. The cost of up-keep must be considered, however, and further reference to the table, which is based on 70 grindings as being the life

it is considered that scrap ends are forged down and used for smaller tools or the teeth of milling cutters, it will be seen that the depreciation is very small.

#### First Applications of the New Steels

The substitution of high-speed steel for carbon steel and mushet steel naturally took place first in those cases where tools were comparatively simple in construction—as in lathe and planner tools—and while the increased output, due to greater cutting speeds and feeds, was truly remarkable, there was a still more remarkable increase in the output from the drills and milling machines, after these latter had been equipped with the new steel tools. This, no doubt, was due in a measure to the fact that in the case of the lathe and planer, the transition was frequently made from mushet steel, with its cutting speed of approximately 30 feet (9.14 metres) per minute to high-speed steel of perhaps 60 feet (18.28 metres) per minute cutting speed; whereas, in the case of the drill and the miller, the change was made, in the majority of cases, from slow-speed steel tools directly to the new high-speed steel tools.

High-speed steels are now commonly used in modern machine shops for turning, boring, planing, shaping, milling, drilling and punching, the most noteworthy exceptions to this rule being found in shops where the product consists chiefly of articles made from the softer metals or their alloys, in which cases the carbon steels are often preferred. There are many purposes, however, for which carbon steel tools are used and will continue to be used in all

shops. High-speed steels are also being used with success in the manufacture of slotting dies. There are at least two reasons why the use of high-speed steel for this purpose has been somewhat delayed, the first being that the speed of a punch or shear press is usually determined by the speed at which work can be fed; the second being due to the risk in hardening expensive dies. The following record of tests made with dies of carbon steel and high-speed steel is interesting.

#### Record of Tests.

The work selected was the punching of notches in sheet steel of 0.0172 inch (0.436-mm.) thickness. This was done on an automatic notching machine, which runs at the rate of 300 notches per minute—the maximum speed at which the work could be indexed with accuracy. Carbon and high-speed steels were run at the same speeds, and it was found that carbon steel dies required grinding oftener than the high-speed steel dies in the ratio of 2.4 to 1. The curves given

in Fig. 3 show the number of notches punched for each grinding of the die. It can be seen that at the end of the tenth grinding the die made from the high-speed steel had punched 1,239,000 notches, whereas the carbon steel die had punched 506,000 notches.

The use of high-speed steel dies increases the production somewhat, as they do not require grinding so often as carbon steel dies. The greatest saving, however, is to be found in the cost of the dies themselves. From data collected from tests similar to the above, it has been found that the relative costs of carbon steel dies and high-speed dies, for a given production, are approximately as two is to one. The loss due to hardening is very small, being slightly under one per cent.

#### Heat Treatment of Tools

The heat treatment of the new steels has remained fundamentally the same since they were introduced. Modifications have been made in the apparatus used for the heat treatment of tools. Electrically heated oil baths provide a handy means of drawing the temper. Lead baths are also used, with thermocouples and galvanometer for temperature control. The galvanometer has four contracts—one for each thermocouple and one for the off position. The accuracy of each electric pyrometer is checked occasionally with a standard instrument, which is kept for that purpose. Heat treatment records are conveniently kept in a card index.

When a new brand of steel is introduced, the determination of its critical temperature is usually necessary. This is conveniently carried out by means of a small electric furnace, in conjunction with a thermo-couple and galvanometer. Small pieces of steel under test are clamped to the side of the thermo-couple and inserted in the furnace. The temperature of the furnace is raised slowly, and simultaneous readings of time and temperature are taken, from which the

FIG. 3.

critical temperature curve of the steel is plotted.

#### Stellite.

A substance placed upon the market under the name of Stellite is claiming considerable attention as a high-speed cutting material. Stellite is not a steel. A recent analysis of a sample gave the following chemical composition:

Cobalt .....	52.03%
Chromium .....	29.36%
Tungsten .....	12.71%
Iron .....	5.35%
Nickel .....	0.45%
Manganese .....	0.24%
Silicon .....	0.09%
Molybdenum .....	Trace

Stellite cannot be forged, rolled or machined, is extremely brittle and tools made from it must be well supported close to their cutting edges. It is supplied by the makers in short cast bars of such sections as may be ground to form tools of simple outline and construction; hence its uses are at present somewhat limited.

Stellite tips may be brazed or electrically welded to shanks of carbon steel, and when so treated, may be used until repeated grindings render the stellite very thin. These tools continued to cut well until their tips were reduced in thickness, by repeated grindings. Tool holders which support their tools close up to the cutting edges are, therefore, especially suitable for stellite.

Under favorable circumstances, cutting speeds may be greatly increased by the substitution of stellite for high-speed steel. Many cases are on record where cutting speeds on machinery steel

have been quadrupled. The following instances may be of interest. Thin cast iron frames, which were very hard on account of their being somewhat chilled, were successfully faced at a cutting speed of 300 feet (91.44 metres) per minute by the use of stellite, whereas the speed for high-speed steel was 45 feet (13.72 metres) per minute. In this case, there was also a decided reduction in the time spent on grinding tools, the stellite tool finishing nine pieces for each grinding as against one piece finished for each grinding of the high-speed steel tool. On an axle-steel shaft of 0.45 carbon the cutting speed was increased from 100 feet (30.48 metres) per minute to 305 feet (93 metres) per minute, when stellite was substituted for the usual high-speed tool. Sandy brass castings have also been machined with considerable success by the use of stellite tools—the cutting speeds being doubled. At present, stellite does not give good results where the cutting is irregular or broken, but where a continuous cut of uniform depth, with small feed, can be used, it will frequently be found that a high rate of cutting, together with a uniform size may be maintained.

#### COAL IN THE FEDERATED MALAY STATES

COAL, a recent discovery, is now one of the commercial products of the Federated Malay States. It is being mined in Selangor, not far from Kuala Lumpur, by the Malayan Collieries, Limited. Though work on an extensive scale was not begun till September last, 11,523 tons of coal were raised in 1915, and it is stated by Mr. W. Eyre Kenny, Senior Warden of Mines, that this coal, where used in suitable plant, will exercise an important influence on mining and other costs, and it is hoped will tend to reduce the consumption of firewood. Among other consumers, two large mines have taken the coal into use, a considerable saving in working expenses having resulted, and a contract has been entered into for part supply of the Federated Malay States Railways. The power plant at the mine comprises two Babcock and Wilcox boilers fitted with stepped grates, supplying steam to the steam winding plant and to a steam electric power station. Two inclined shafts have been sunk to a distance (on an incline) of 846 ft. and 800 ft. respectively, together with a ventilating shaft and airways, supplied by an electrically-driven fan. Experiments in briquetting are in progress, under the supervision of Prof. Bone, in England.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## SCREW CUTTING ENGINE LATHE WITH GAP BED.

THE lathe which is shown in the accompanying illustration is designed to meet the demand for a small screw-cutting engine lathe with gap, capable of doing all of the light work ordinarily performed on larger and more expensive machines. It is built by the Perfect Machine Co., Galt, Ont., in two sizes—12 in. and 14 in. with a 6 ft. bed. Convenience of design and accuracy of workmanship have been so combined as to render this tool particularly useful for machine shops, garages, experimental work, trade schools and opticians, etc.

Six spindle speeds are provided on the headstock, which has a three-step cone pulley with back gears, and is designed to afford maximum rigidity. The spindle is made from a high carbon steel forging, is finished by grinding, and has a  $\frac{7}{8}$ -in. hole through its length. Split bronze bushings allow of wear being tak-

en up on both bearings, while end thrust is taken by a threaded collar. Reverse gear for screw cutting is also located on the headstock.

Careful attention has been given to the lead screw, which is of high carbon steel and accurately cut. It is splined for feeding on ordinary work through a friction feed so that the threads are only in use when cutting screws.

By means of an interlocking safety device, it is impossible to engage either the longitudinal or cross feed friction mechanism, while the half nuts for screw cutting are engaged. Both friction feeds are engaged by turning knobs and the crank hand of the cross-feed does not revolve while the power feed is on. Feed reverse in either direction is also provided.

The compound rest is graduated for angular settings, while the tailstock is quickly locked or released by the single movement of a lever. Equipment includes a plain faceplate, centre, and fol-

lower rest, steady head, set of change gears, wrenches, etc. The principal dimensions of the two lathes are respectively, for 12 in. and 14 in. size—swing-over carriage,  $8\frac{7}{8}$  in. and  $10\frac{7}{8}$  in.; swing-in gap,  $17\frac{1}{2}$  in. and  $19\frac{1}{2}$  in.; width of gap, 5 in.; width of same in front of faceplate, 5 in.; front spindle bearing,  $1\frac{7}{8}$  in. by  $2\frac{1}{2}$  in.; rear spindle bearing,  $1\frac{1}{2}$  in. by  $2\frac{3}{8}$  in.; dia. of lead-screw,  $1\frac{1}{8}$  in.; width of cone steps,  $1\frac{1}{2}$  in.; weight with countershaft, 800 lbs. and 850 lbs.

## DUPLEX SURFACE GRINDER

SIMPLICITY of design, consistent with the purpose of the machine has been the chief aim in producing the Duplex Surface Grinder, illustrated herewith. It has been developed through more than two years' use in the tool room and production departments of the Stenotype Co., Indianapolis, and is now regularly produced by them.

The design is that of a simple hand-

SCREW CUTTING ENGINE LATHE WITH GAP BED.

operated surface grinder, with a table on each side of the column, and an emery wheel for each table on opposite ends of the spindle. Each table is fitted with magnetic chuck, each chuck having its own switch. This gives practically two machines, each of which can be operated independently. As the mechanism of each table is independent, it enables the two operators to do their work at the same time, without the slightest interference with each other.

Either table can be elevated and fed entirely without interference from the other. Having the two wheels on the same spindle secures great rigidity and, therefore, accuracy, due to the distance apart of the bearing points, and this is further assisted by the long bearings used. The longitudinal feed is secured by means of the hand lever shown in the illustration and provides a steady, easy feed. The cross-feed is secured by means of the small wheel in front of each table. Each table is raised and lowered independently by means of their respective elevating hand wheels. The elevating hand wheels are graduated in thousandths. The knees on either side supporting the tables are designed extra strong, thus giving unusual rigidity and preventing any springing from under the table. The long spindle is hardened and ground and is supported on two 6-in. Non-Gran High Speed Bronze bearings. The spindle is carefully fitted to hand scraped bearings to insure a true running wheel without the slightest vibration.

Great accuracy with this machine is possible because of the large bearing surfaces, heavy supports and the very careful workmanship throughout. The time of setting up an automatic machine is saved and at the same time no sacrifice is made in accuracy. There is a distinct gain in speed in addition to the elimination of setting up, in that the operator can feed his work exactly according to his judgment, without having to stop it to change adjustments.

The machine comes equipped regularly with two standard magnetic chucks of the greatest efficiency that can be procured; also two emery wheels and the countershaft. The magnetizing switch is also included without extra charge. Wheels suitable for this grinder can be obtained from any of the grinding wheel makers. Note that the wheel guard may be removed and any other wheel within the limits of the machine can be used.

Leading dimensions are.—Vertical movement of table, 8 in.; working surface,  $5\frac{1}{4}$  in. by 12 in.; max. distance, spindle to table, 13 in.; working surface of magnetic chuck,  $4\frac{1}{2}$  in. by 10 in.; emery wheels up to 7 in. dia. by  $\frac{1}{2}$  in.

wide; floor space, 20 in. by 48 in.; net weight, 520 lbs.

### 22 IN. ENGINE LATHE.

THE accompanying illustration cut

DUPLIX SURFACE GRINDER

represents a 22 in. lathe the design of which is along the same lines as the 16 in. and 18 in. size already built by the makers. It is built either in the single or double back gear head and with quick change or semi-quick change feed.

The front spindle bearing is  $3\frac{3}{4}$  in. in diameter by 6 in. long. Hole through spindle is 2 in. Diameter of cone pulley steps on the double back gear are  $11\frac{1}{2}$

with all steel gears. Both cross and longitudinal feed operated by one lever through expanding ring frictions. Headstock is of massive construction and has two large drop ribs running the full length. Compound rest is clamped by one bolt by means of a steel dove-tail clamping ring.

Actual swing over bed  $23\frac{1}{8}$  in. swing over carriage  $15\frac{1}{2}$  in. This machine weighs about 4500 lbs. and is built by the Morris Machine Tool Co., Cincinnati, O.

### PAPER FROM KAING GRASS

IT IS announced that the conversion of the Kaing grass of Burma into pulp, and subsequently into paper, can be accomplished in a simple and economical manner. It is expected that arrangements will soon be completed for the collection of the grass, its conversion into pulp, and its shipment in this form to paper-makers in the United Kingdom. The yield of unbleached pulp is 39 per cent., calculated on the air-dry grass, compared with about 43 per cent. of unbleached pulp obtained.

AN encouraging sign of British trade alertness in foreign markets is the action of a number of manufacturers in co-operating in the production of catalogues printed in English, French and Spanish. The catalogues, which are to be sent to importers in all parts of the world, are cloth bound, and are so arranged that any article or any manufacturer can be easily found. The general classifications of textiles, hardware, drugs, construction, materials, etc., are subdivided, and importers are asked to mark on application blanks the special lines in which they are interested, when volumes containing these sections will be forwarded. The cost of publishing these catalogues is

22-IN. ENGINE LATHE.

in.,  $12\frac{3}{4}$  in. and  $4\frac{1}{4}$  in. wide. The carriage is unusually heavy with wide bridge and the length of it is  $33\frac{1}{2}$  in. Apron is of double wall construction

estimated at £50,000, and in addition to this the English exporters offer to pay freight and duty on them in the distribution to prospective customers.

## MACHINISTS' INSTRUCTION COURSE.—VI.

**T**HE lathe is the backbone of the machine shop; without accurate lathe work no modern machine shop can be run. It is capable of a larger variety of operations than any other machine in the shop, and it requires considerable care and skill to become a good lathe hand.

### Lathe Work

It has been found that many operations can be more economically performed on a lathe which is specially adapted for some specific purpose, so that we have a number of lathes that are really special types in their own line, such as axle lathes, wheel lathes, turrets, etc. We will take for our consideration the operation of a tool room, engine or general purpose lathe, as any man that can operate a lathe on general work will have no difficulty in operating a special machine, the main principles being the same.

FIG. 29.

Consider first the turning of a plain round bar, and deal with conditions as we find them; there is a world of difference between actual conditions as you find them in some shops, and what you read about in text books. This bar might have been cast in the foundry, cut off with the shop saw, or as it often happens, the saw was busy with another job, so the blacksmith just nicked it round with a chisel and broke it off, leaving a nasty ragged end. The first thing to do is to face, or cut off the bar to the proper length. If the bar has a ragged end, don't waste time finding centre with compass or jenny-legs. Put the bar in the chuck, passing the bar through the hollow spindle of the lathe, and leave just enough sticking out of the chuck to face or cut off. (Fig. 29).

### Cutting Off

If the lathe spindle should not be hollow, or if the bar should be too long, you will need to support one end with a steady bead. If there is sufficient length to cut off use a cutting-off or parting tool, but if there is not

more length to cut off than the width of the cutting-off tool, use a knife tool. Don't use a cutting-off tool any longer than is necessary, the length should slightly exceed

FIG. 30.

half the diameter of the bar to be cut, the width from 3-16 in. to  $\frac{1}{4}$  in. After facing the end, the most convenient tool for centering is a combined dull and countersink to fit the tailstock, which is then fed into the bar with the tailstock spindle. A very useful tool is a centering tool; it is made of a standard size tool steel used in the lathe, hammered out like a flat drill, and used in the lathe tool post like any other drill. It is indispensable for truing up the centre of an old shaft. The centering drill of tool should be at an angle of 60 deg., to suit the angle of the lathe centres. (Fig. 30).

FIG. 31.

### Proper Centres Essential

It is important to have round, smooth, centres at the correct angles, as it is impossible to do good lathe work with

bad centres. If the centre is not made with a combination drill and countersink, a small hole should be drilled into the bar, as shown, to ensure that the centre will not ride on the point when the centre hole wears a little.

After centering, we are ready to begin turning. Put a lathe dog on one end, and lubricate the centre hole at the other end. The tailstock must be set to the proper position for holding the work between the centres; don't wind out the tailstock spindle any further than is necessary, and have the pressure on the spindle such that the work can be turned by hand, but not loose enough to have any end play, or fall down by the weight of the dog. Be sure that the tail of the dog is quite free in the slots of the faceplate or driving plate. A common mistake for beginners is to have the tail of the dog held up in such a manner as to hold the work away from the live centre, Fig. 31.

FIG. 32.

thus causing the work to run untrue. The writer considers that the proper way to drive a round bar is with a dog with a straight tail, driven by a pin bolted in one of the slots or holes of the face plate. This gives a direct drive and avoids all possibilities of twisting or jamming of the tail in the slot.

### Truing the Bar

The next thing is to see that the bar is running true. It may be true at the ends, but bent in the middle more than the amount of stock to be turned off. If there is no special straightening machine, and it is seldom there is, it can be straightened between the centres of the lathe either by the use of a jim-crow, Fig. 32, or with a bar or lever, unless the job is a heavy one, when it might be necessary to take it to the blacksmith shop. Straightening a shaft cold in the lathe stretches the metal and sets up a kind of internal strain in the metal, so that it will very seldom remain true after being cleaned up with one cut; never try to finish a job with one cut that has been straightened in the lathe. If there is an old lathe that can be used for

straightening, so much the better, as straightening between the centres is bad for the lathe and should be avoided if possible.

In using the jim crow, revolve the work round in the lathe and hold a piece

FIG. 33.

of chalk against it to find the high spots. Put the high spot or bent part at the top, right under the screw of the jim crow, and tighten up the screw until you judge you have taken out the bend. Test the bar by revolving it round again, and repeat the operation until you have the work true enough to turn up. The work can also be straightened by putting a bar or lever under the work in such a way that when the bar or lever is pushed down the work is sprung up, only in this case the marked or bent part must be down. After a few trials it will be found to run nearly true. If the bar is too stiff to be straightened by simply springing it with a bar, give it a few sharp blows with a hand hammer on the top of the shaft while holding it up with the bar. The hammering should be light or the bar will be found to be bent the opposite way.

If the job has been straightened between the centres, examine the lathe centres before starting a cut, putting the lathe on top speed to see if the live centre is true. If the live centre is slightly out of truth, although a piece of work turned out on it might be straight and true, or a number of different sizes were turned, they might all be true with each other, they would not be true with

have a true live centre, especially when work passes from one lathe to another before being finished.

#### Hardening of Centres

The dead centre should always be hardened. The live centre may or may not be hardened, according to circumstances. If a live centre is turned, hardened, and then put back into its place, the chances are that it will not run true, owing to unequal expansion and contraction in the operation of hardening and tempering. To use hardened live centres they ought to be ground in their place by a special grinding attachment for that purpose. On the other hand, while a soft lathe centre can easily be turned up and trued, it can easily be bent or bruised and made untrue.

If you are working in a shop that has grinding attachments for the lathe, by all means harden the live centre, but if not, better leave them soft or have the temper drawn just enough to turn. Even though the centre is ground perfectly true, it will be found that after removing it and putting it back it may not run true. This is due to the fact that the centre hole in the spindle is not always absolutely true; therefore, when turning the centre always make an identification mark on it and on lathe spindle to enable you to put them back in the same place. (Fig. 33).

All kinds of devices have been used for removing the lathe centre, leaving squares, or flats, on the centre, hammer and chisel, pipe wrenches, etc. One of the best methods is to thread the centre with a fine thread and fit on a nut, which also acts as a good support for rough or uneven turning. (Fig. 34).

#### MANUFACTURE OF ELECTRICAL APPARATUS IN INDIA

THE present war is making India more dependent upon herself for the production of material that has hitherto been imported from Europe and elsewhere. As far as engineering material is concerned, she has been able to produce both the quality and quantity required in whatever she has taken up, and *Indian Engineering* now asks, Why should not she extend her field and introduce the manufacture of such electrical goods as are at present only imported? According to our *Indian* contemporary, most, if not all, of the raw material required for the manufacture of electrical plant and machinery is procurable in the country; this being the case, why, it is asked, is it not utilized in the country instead of being exported for manufacture in some other country, and again imported in the shape of the finished article for use in India? The main reason for this seems to be the question of finance, no firms being prepared to lay out a large sum on the open-

ing up of a new industry in a foreign country the success of which is not assured. The demand for electrical plant and machinery in India has increased enormously during the past few years, and there is no doubt that this demand is going to increase steadily for several years to come.

#### RUSSIAN PLATINUM

ACCORDING to a Consular report the outlook for platinum mining in the Urals, as judged by recent events, would seem to foreshadow an even smaller production this year than in 1915. Recent mobilizations in the platinum mining districts, which have hitherto not been called upon, have greatly curtailed the output from hand washing. Austrian prison labor and Chinese labor, although largely utilized in other industries, have not been adopted in the platinum industry. The production from the larger companies by means of dredging is likely to be similarly affected by this scarcity of labor. The future as regards prices is largely dependent on the quantities the Government allow to be exported, as the Russian internal consumption is not sufficient to influence prices either one way or the other.

#### MOLYBDENITE

THE great demand for molybdenite has had the effect of producing a much-increased output from many of the mines now operating in Queensland, and numbers of prospectors have been induced to examine areas of country where indications of the mineral appear in the outcrops of lode formations, but no phenomenal developments have taken place as a result of these operations. The principle molybdenite lodes are at Wolfram, in the Chillagoe field, other important deposits occurring at Bamford, in the same district. Official records show common occurrences of the mineral in small quantities in quartz lodes on many fields throughout Queensland.

PEOPLE are very apt to dismiss what they do not understand very easily as theoretical, and therefore useless; that is a very easy way out of a difficulty, as it saves the bother of learning. But it is a fatal mistake to carry that attitude too far, because theory which stands for systematic knowledge can not safely be dismissed as merely academic. If the facts established in the laboratory do not work out in practice, it must be that some factor is not understood.

The Canada Copper Co.'s production for eight months at the Greenwood, B.C., smelter, was 3,455,578 lbs. copper, 3,555 ozs. gold, and 33,096 ozs. silver.

FIG. 34.

the centre hole in the shaft. If, however, the dog was loosed off and clamped again in a fresh place, or the piece was turned end for end, it would not run true, so that it is very necessary to

### CURRENT VIEWS OF CAPITAL AND LABOR

THE annual meeting of the British Association for the Advancement of Science was held at Newcastle in the beginning of September, and by a curious coincidence the Trade Union Congress at Birmingham was held at the same time. The proceedings of the latter body have been fully reported by the delegates from the various countries and the various addresses delivered at the former body are now available. In common with every public body of prominence the attention of members was directed by many of the speakers to the vast social and economic changes brought about by the conflict.

No man will question the truth of the position as defined by the Lord Mayor at Birmingham when he said the aim of the working classes was that it should be worth while to live in the country they had done so much to preserve. Just how to reconcile the probable refusal of the Trade Unions regarding an ultimate lowering of wages and at the same time return to old days of restricted output and high costs is a matter which will not lose in importance as the time draws near for adjustment.

The hopes of Canada to attain a high place in world commerce are worthy of all fulfillments and the absence of such a vital factor as restricted output, with its train of trouble, disagreement, and economic loss, is one feature of our outlook for which we as a nation should feel thankful. Even now, when women have entered this field, the result of their efforts has not been to show the work of our men to disadvantage. To the average Canadian employee it seems almost impossible that refined women should continue indefinitely to produce two or three times as much work as an able-bodied man was previously allowed to do by trade union rules.

With all desire to maintain the trade supremacy of the Empire in general, and Britain in particular, it is impossible for a person accustomed to Canadian conditions to see how a body of presumably intelligent men could deliberately lie down on the job to such an extent.

The answer to the whole situation seems to be a lack of confidence, and in the mutual sacrifices which have been and may still have to be made by both capital and labor,

may rest that future freedom from internal strife, without which present sacrifices will have been in vain. It may, in fact, be that the appearance of the gentler sex on the industrial horizon has served a dual purpose, that of diligent example to labor, and that of generous recognition to capital. Recognition, not limited to a scant nod in the factory and ignoring in the street, not the feeling that when the man's pay is made up for the week the employer need have no further interest in his welfare,—recognition such as that is to a great extent responsible for the present attitude of labor. The new recognition has been brought about by the women themselves, whose presence has resulted in the provision of kitchens, canteens, rest-rooms, laundries, etc., in connection with many establishments, while in the shop itself increased attention to labor-saving appliances, lighting, inspection of product, tool-room service and supervision of effort generally, have all contributed their share to the present results, so much so that a reversal to former conditions of latent antagonism seems almost unbelievable.

After viewing the standpoint of the Congress it is interesting to observe the criticisms of capital which were made by various speakers at the Association. Prominent among these was Mr. Gerald Stoney, F.R.S., who presided over the Engineering Section, and in the course of his address discussed some of the problems which face the engineering trade of Britain, and in lesser degree Canada. As an engineering manufacturer of wide experience Mr. Stoney was qualified to comment on the handicap under which our industries suffered from the reluctance of firms to utilize highly educated labor or to adopt scientific methods.

With direct reference to Newcastle district, the speaker asked how many engineering firms had a skilled chemist on their staff; and what percentage of these pay him a decent salary? How many heads of firms have sufficient chemical knowledge to appreciate the work, and utilize the services of such a man, because unless there is an appreciation of the work done by him, his services are useless and he becomes discouraged, generally finding himself up against the blank stone wall of passive tolerance, if not of active prejudice. And yet chemical problems are continually cropping up in engineering work. Perhaps the most significant statement was that Leipzig University alone has an annual income from the German Government of \$500,000 against a total British grant to all universities of about \$225,000.

Equally discouraging was the support given to the National Physical Laboratory which receives a grant of \$35,000, as against \$350,000 enjoyed by its German equivalent, and \$700,000 which is granted to the Bureau of Standards at Washington. With regard to private investigation, Sir Charles Parsons is quoted as saying that a man or firm in the face of financial difficulties cannot carry on research work. The minimum spent on research work should be at least 1 per cent. of the turnover and the amount it is advisable to spend is 3 per cent. Unless a firm makes good profits it cannot keep up-to-date and will sooner or later go to the wall.

The foregoing concluding sentence is one reason why any attempt by labor to enforce a retrograde act on capital will meet with the opposition of men striving for life. It is known that labor has deliberately restrained effort, it is known that with a reasonable effort and mutual trust labor may earn much more and yield more, it is known that without increased and continued yield labor as typified by trade unions will be as a millstone on the neck of capital, the question of the hour; therefore, is mutual trust and events seem to be working surely if slowly to such a desired consummation.

## INDUSTRIAL NOTABILITIES

**T**HOMAS FINDLEY, Vice-President and Assistant General Manager Massey-Harris Co., Toronto; President, Deyo Macey Engine Co., Binghamton, N.Y.; Director, Johnston Harvester Co., Batavia, N.Y.; Vice-President Toronto Housing Co.

Mr. Findley was born in York County, Ont., on December 16, 1870, being the son of Thomas and Agnes (Thompson) Findley. He was educated in the public school at Sutton West, Ont., and began his business career as a telegraph operator and postal clerk in the same town in 1886. In 1890 he joined the Massey-Harris Co., as a telegraph operator, remaining with the firm until the present time. His advancement has been

THOMAS FINDLEY,

steady and continuous. He became Chief Accountant in 1895; Assistant to President in 1902; Assistant General Manager 1907; Director 1909 and Vice-President 1912, which position he holds at the present time.

Mr. Findley is a member of the Canadian Manufacturers' Association. He was Chairman of the Legislative Committee 1912-1914, and is a member of the Executive Council. He is an active member of the Presbyterian Church, being a member of the General Board of Finance.

Mr. Findley married Phoebe Constance Smith, daughter of Samuel Smith, of Kingston, Ont., on April 24, 1894, and has two sons and one daughter.

He is a member of the Lambton Golf and Country Club, and St. Andrews' Society. His recreations are golf and motoring, and he lives at 88 Admiral Road, Toronto, Ont.

tion to the heavy requirements for munition steel, the consumption for domestic purposes has increased considerably. The demand for sheet bars and billets has quieted down a little, but the demand for steel rails is increasing. Renewed demand for plates is a feature of the market, owing to the heavy requirements, for steel cars; delivery in many cases being scheduled for the last quarter of next year. The tendency is for higher prices in sheets, due to the active demand for black. blue annealed and also galvanized material. The Pittsburgh quotation on black sheets has been advanced \$3 per ton, and galvanized sheets \$1, prices being now \$3.25 and \$4.40 per 100 pounds respectively. No developments have yet taken place regarding the expected advance on wire and kindred products, but an early move is anticipated. The demand is very heavy and it is impossible to satisfy to the full extent consumers' requirements. The local situation has not yet been affected by price changes.

**Metals**

The market is comparatively quiet at present with tin developing increased activity. Copper continues strong but quiet. Spelter is firmer and prices stronger but not very active. Lead is steady. Antimony shows signs of improvement, prices becoming stronger.

**Copper.**—The situation is unchanged and the market continues quiet but firm. The present strong position of copper will likely be maintained throughout the winter months, as producers are assured of capacity business for a long period, and are apparently well satisfied to let the outside market adjust prices; which under present conditions will only be affected by resale metal. The London market is stronger on all grades electro being quoted at £141. The New York market is firm with quotations on prime lake steady at 28½c electrolytic strong, being quoted at 28¾c and castings at 27½c. The local situation is strong and firm at unchanged prices.

**Tin.**—The outlook for tin is showing signs of improvement, and indications point to early activity. No heavy buying is yet taking place, as the general market appears doubtful as to the actual strength that the situation is developing, believing that conditions are largely the result of higher prices abroad. However, an undertone of anxiety seems to prevail among the trade that may result in a buying movement at any time. Holders of metal are not forcing sales, and further advances are foreshadowed by market conditions. Dealers here are quoting 44c on a strong and steady market, which represents an advance of ½ cent per pound.

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

**Montreal, Que., Oct. 9, 1916.**—Industrial activity continues to indicate the heavy demand for all classes of manufactured products. The steel situation is still the outstanding feature, further advances pending. In addition to productive activity, commercial interests are reporting increased business and revenue, which is a very encouraging factor. The present situation is seriously affected by the pronounced shortage of materials, and little relief is expected for some time.

**Pig Iron**

The pig iron situation is reflected in the additional advance on pig iron in the Pittsburgh district, \$1.50 per ton

being added to Bessemer and 50 cents to basic pig. Quotations are now \$24.95 and \$20.45 respectively. Foundry grades in the same district have been advanced another \$1 per ton.

**Steel**

On top of the recent advances on many lines of steel and the evident scarcity of material, the prospect is for still further advances. The mills are unable to cope with the excessive demands and deliveries are being extended. Unless something can be done to increase production, the shortage may become more acute although everything possible is being done to keep the steel plants operating at capacity. In addi-

**Spelter.**—While no definite reason can be discovered as to the cause of the present condition of spelter, the market is undoubtedly stronger. While consumers do not appear willing to pay the figure that dealers are asking at present, the fact that sales are being made at advanced prices would indicate that early developments may be expected. In some respects consumers are well covered for immediate requirements but many are uncertain as to what is to follow. It is true that galvanizers have been showing increased interest in spelter, but not sufficient to warrant any radical change in the market. However, it is not anticipated that price advances will be very marked, although the situation may develop a stronger tendency. The dealers here are quoting the unchanged price of 13c per pound, on a quiet market.

**Lead.**—The quiet tone of the market has not affected price quotations, and both the leading interests and independents are holding firm. The basis of prices remains steady at 7c New York, with some outside producers asking slightly higher figures. The London market is a little easier. Dealers here are quoting 9c per pound.

**Antimony.**—An undertone of strength appears to be developing in the antimony market and higher prices are probable. The local market is quiet and unchanged at 15c per pound.

**Aluminum.**—The market is firm and strong with quotations at 70c per pound.

#### Machine Tools and Supplies.

The machine tool activity is somewhat handicapped owing to the apparent shortage of labor; and the delivery on certain tools is causing purchasers some inconvenience. Shell shops are also suffering from lack of help, which is effecting the demand for equipment. The feature of the situation continues to be the demand for heavy duty lathes. With the increasing interest taking place in foreign products exhibits, it is expected that further activity may develop in domestic requirements for machine tools.

#### Scrap

Following the advance of last week. Quotations have held pretty firm on an active market. Dealers report good business in all lines.

**Toronto, Oct. 10.**—The steady advance in prices of practically all metal goods has again become a question of considerable importance in machinery circles. New high levels are being reached in steel and iron products which is reflected in all lines of machinery. Cost of production is also

higher on account of increase in prices of materials and also higher wages. Signs are wanting of any relief in the situation and indications point to still further advances. High prices however, under prevailing conditions are not so important as deliveries. In the case of steel, the mills are getting behind all the time on delivery and specifications have to be prepared months ahead of the time when the steel is required. As regards machine tools the situation is not so acute although on milling machines and grinders, ten months is often required before shipment can be made.

#### Steel

The prospect of higher prices of steel products has caused an increased demand as consumers are anxious to cover for their requirements, fearing further advances. That steel prices will advance is inevitable owing to the in-

#### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

creasing demand which is heavier than the steel companies can take care of. Furthermore, deliveries are getting more backward and the situation in the steel trade is getting tighter. The total output of steel for this year has been estimated at 1,500,000 tons as compared with 1,350,000 tons in 1913, the previous high record. Notwithstanding this big increase in output, the prevailing shortage of steel will continue for the rest of this year and for a considerable part of 1917 unless anything unforeseen happens. One prominent steel company is turning out steel billets at the rate of 15,000 tons a month, more than twice the amount produced in a year ago. There is no improvement in the situation as regards steel rails. It is reported that U.S. mills have turned down an enquiry from Canada for 22,000 tons of rails as the rail making mills for this and next year have been booked to capacity. Under the circumstances it looks as if the proposed removal of the tariff on rails would not relieve the situation. So much steel is required for munitions that the Canadian rail mills cannot accept orders for rails. No price changes on steel

products except on pipe have been announced during the week but further advances on bars, plates and tubes are looked for in the near future. The shortage of steel is evidenced by an enquiry for 30,000 tons of billets from a U.S. firm for delivery during the first half of 1917, CANADIAN MACHINERY understands that no Canadian mill can take the business.

The market for black sheets continues very firm and the situation unchanged. Sheet bars are still being quoted at \$45. per ton Pittsburgh, but this price is practically nominal and an advance is looked for as the mills are sold up for several months ahead. An advance of 10 cents per 100 lbs., has been made on "Premier" galvanized sheets owing to the continued high price of black sheets and firmer spelter market.

A shortage of labor in the United States is making it difficult to increase production and with the demand for steel continually increasing, deliveries are consequently getting further behind. A feature of the market is an exceptionally heavy demand for plates. It is understood that the U.S. Steel Corporation plate mills are sold to full capacity during 1917. The scarcity of unfinished steel is getting more acute and unusual methods are being resorted to in order to produce additional tonnages. Steel bars have advanced and are now quoted at 2.75c Pittsburgh.

#### Pig Iron

The pig iron market continues very firm and the general situation unchanged. Production is steadily increasing the greater part being used in steel making although the demand for foundry grades is showing some improvement. Quotations on Canadian pig iron are unchanged in the meantime but an advance is looked for. Gray forge has again advanced and is now quoted at \$19.95 Pittsburgh.

#### Scrap

Although the market for old materials has recently developed considerable firmness there has been no price changes during the week. The situation continues satisfactory and business is keeping up well. Higher prices on scrap copper, brass and zinc are expected in the near future.

#### Machine Tools

The demand for machine tools continues steady being, as for some months past, almost entirely for equipment for munitions plants. The output of shells has not yet reached the desired volume but steps are being taken to improve the situation by increasing the available supply of labor. An increase in activity in the machine shops will help to im-

prove business in the machine tool trade.

### Supplies

Prices of practically all machine shop supplies composed of steel or brass continue to advance and deliveries are getting more backward. The advances this week include bright, brass and bronze wood screws, milled products, carborundum goods and wire rope. Brass globe valves are down being listed at 27 per cent. instead of 25 per cent. formerly. The linseed oil market is considerably stronger and prices have advanced. An advance has been made in twist drills owing to the increased cost of steel and labor.

### Metals

The situation in the metal markets has recently shown considerable improvement and prices are generally firmer. Copper continues to hold the lead in point of interest and the market is still very strong. It is intimated by some copper authorities that the order recently placed by the Allies ran in excess of 500,000,000 pounds and not 448,000,000 pounds as previously stated.

Lead, spelter and antimony are stronger at unchanged quotations but a sharp advance has been made in tin owing to the fear that shipments may be interfered with by submarines which have recently been active along the New England coast.

**Copper.**—The market continues very strong without any change in the situation. Producers report that the demand is less urgent. Domestic consumers are now pretty well covered for the first half of next year and the Allies have covered for their requirements for several months which indicates that there will be less activity in the market until another buying movement develops. Copper producers are increasing their output all the time but they have been unable to keep up with the demand, it is probable therefore when new buying does develop, higher prices for copper will result. Local quotations are firm and unchanged at 31 cents for electrolytic and lake, and 30 cents per pound for castings copper.

**Tin.**—Good business is being done for future delivery, especially for the first

quarter of next year. It is also reported that some large users are sounding the market on tin for delivery in the second quarter of 1917. The recent submarine activity off the New England coast has created some scare in the tin market and prices have advanced 3 cents per pound. Local price 47 cents per pound.

**Spelter.**—The situation in the spelter market has improved and indications point to higher prices. There has been a good demand recently from speculative interests and the market is more active. Local quotations in the meantime are unchanged on 14 cents per pound.

**Lead.**—The market is quiet but very firm, the Trust price of 7c New York is well maintained. A fair demand is reported and most dealers have very little October lead available. It is reported from New York that the Canadian Government is expected to come into the market very soon. The recent enquiries put out by Canada failed to develop into business as the buyers thought the prices were too high. Local price 9c per pound.

## CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

### CANADIAN TRADE COMMISSIONERS.

**ARGENTINE REPUBLIC**

J. T. Lithgow, 87 Union Street, Glasgow, Scotland. Cable address, Cantracom.

Harrison Watson, 73 Basinghall Street, London, E.C., England. Cable address, Sleighbing, London.

### SPECIAL TRADE COMMISSIONER—LUMBER

H. R. McMillan, visiting Europe, Africa, Australasia and the Orient.

### CANADIAN COMMERCIAL AGENTS

**BRITISH WEST INDIES**  
Edgar Tripp, Port of Spain, Trinidad. Cable address, Canadian.  
R. H. Curry, Nassau, Bahamas.

**NORWAY AND SWEDEN**  
C. E. Sontum, Grubbegd No. 4, Christiania, Norway. Cable address, Sontums.

### CANADIAN HIGH COMMISSIONER'S OFFICE

**UNITED KINGDOM**  
W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England. Cable address, Dominion, London.

**Antimony.**—The market is stronger due to increased demand required for munitions. Local quotation unchanged at 18 cents per pound.

**Aluminum.**—A good demand for aluminum is reported and the market is firm at 68 cents per pound.

**Solders.**—Prices of solders have advanced on account of the sharp advance in tin and also because of the high cost of lead. Guaranteed as quoted at 29½¢ and strictly at 27½¢ per pound.

### HIGHER RAILWAY EARNINGS

AGGREGATE gross earnings of the three big Canadian railroads for September make a good showing; although the total falls below those of both July and August, and the increase is the smallest in a percentage way so far this year.

It was pointed out some time ago that it was in September a year ago that earnings began to rise sharply for a long and severe descent, and that comparative figures, in the best of circumstances, could not be expected to make the spectacular showing of the preceding twelve months. Added to this as a factor in the actual returns and their possibilities of continued expansion is the smaller grain crop that is to be handled this autumn.

It is well to note at this stage of the railroad year, however, that if some subsequent contraction is to be faced, the results of the first quarter have been extremely favorable. As compared with the three months of July, August and September, a year ago, the three big systems have rolled up this year an increase of no less than \$17,686,333, or about 40 per cent. gain.

### Per Cent. Gains

As to the comparative showing for September and the gain of 19.1, as compared with gains of 50 per cent. in the midsummer months, it may be noted that last year gross earnings increased about \$3,500,000, or 26 per cent. from July to September as a result of the record-breaking grain movement. This year September has fallen a little short of the July record. Against the sharp upward movement from summer to autumn last year, there has been a slight downward movement this year.

Grand Trunk figures are a feature of the September record, the average daily earnings being the best the company has reported this year. There was one day less in the month, however, and August figures were actually a little higher than September.

September returns, as reported in the weekly statement, follow:

Road.	Sept., 1916.	Increase.	P.C.
C. P. R. ..	\$11,846,000	\$1,851,000	18.5
G. T. R. ..	5,636,826	1,032,293	22.4
C. N. R. ..	3,187,900	430,900	15.6
Total ..	\$20,670,726	\$3,314,193	19.1

Aggregate gross earnings of the three systems by months so far this year, and the increase over 1915, follow:—

Month.	Earnings.	Increase.	P.C.
January ..	\$14,724,216	\$3,966,003	36.9
February ..	14,667,915	3,237,879	28.3
March ....	17,344,243	3,371,539	27.4
April ....	18,077,805	4,959,127	37.8
May .....	19,959,336	7,224,934	56.7
June ....	19,840,173	6,659,139	50.5
July ....	20,956,091	7,040,445	50.6
August ...	22,315,176	7,331,695	49.5
Sept. ....	20,670,726	3,314,193	19.1

### EXHIBITION OF ENEMY SAMPLES

THE Exhibition of Enemy Goods opened in Montreal a few days ago, represents the concrete realization of the British Government's plans to assist British and Dominion manufacturers in capturing German trade. The exhibit is in charge of H. Kershaw, representative of the British Board of Trade. The 8,000 German and Austrian-made articles in the exhibit were bought in the open markets of the world—70 in all, to be correct. Wherever possible, each article has the wholesale and retail price, place of purchase, and other details affixed. The department is also prepared to give information as to where buyers for any article exist.

### Textiles First, Hardware Second

The greatest number of inquiries so far has been for textile lines, and second for tools and general hardware. The quality of most of the latter is poor, and in the words of one visiting manufacturer, "Sheffield would not turn out such stuff." The fact remains, however, that there is a sale for such articles and the Germans built up an enormous trade in just such goods that other nations had not considered worth while. Thus, one knife shown consisted of a sheet iron blade riveted once into a split wooden handle, which in turn was painted in bright colors. This article was meant for use in the African hinterland, and illustrates the German method of giving people what they want and not what the manufacturer thinks they ought to want. Shoes sold in Trinidad had soles of pressed paper, which were glued to the uppers. Samples of some goods, such as textiles, are frequently given to inquiring visitors for a more detailed examination at their factories.

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

#### BRAZIL

Bahia, British Consul.  
Rio de Janeiro, British Consul General.

#### CHILE

### Lesson of Exhibit

The lesson of the exhibit, as indicated by the remarks of a great variety of visiting manufacturers, jobbers, wholesalers, etc., is, "We must systematize." We wish particularly to focus attention on the industries that can be taken up after the war. The increased debt of Canada, her future pension payroll, and similar charges, all demand an increase in revenue. This appears to be the logical method of getting it.

### Getting Together

In Britain the object of the exhibition is primarily to induce manufacturers to take up new lines; to indicate to them probable markets for their present product, and to put them in touch with importing agents in overseas countries or export merchants in England. Exporters have visited the exhibit for the purpose of getting in touch with manufacturers for the founding of new markets, and vice versa. It brings buyers and sellers in touch with one another. The same condition prevails here.

The articles shown are of great variety, and include the following classes of goods:—Textiles, soft and hard haberdashery, fancy and leather goods, glassware and crockery, hardware, enamel goods, aluminum ware, etc.; tools, cutlery and electro goods, and numerous miscellaneous lines. The exhibition will be held in Toronto.

### CANADA'S REVENUE INCREASE.

A REVENUE of well over \$200,000,000 is in prospect for the present fiscal year, according to an estimate made public recently, by Sir Thomas White. This will enable the Dominion Government to apply \$50,000,000 or more against the principal outlay on war account.

The official returns for the first half of the fiscal year, that is to say, up to September 30, are now available and make, in the opinion of the Minister of Finance, a showing satisfactory beyond the highest expectations of the budget. The revenue of the Dominion from all sources has reached a total of \$103,000,000, or \$30,000,000 in excess of that for the first half of last year. The total expenditure, which includes an increase of interest of \$4,500,000 upon war borrowings, is about the same as last year, the higher interest charges being offset by reductions effected in public works and railways and canals expenditures. It now seems certain that the total revenue for the year will amount to at least \$210,000,000 or possibly \$220,000,000.

### Trade and Bank Deposits.

Equally satisfactory with the revenue returns are those showing the total trade and bank deposits of the Domin-

ion. For the first five months (ended August 31) of the present fiscal year, the total trade of Canada (imports and exports) aggregated \$791,000,000, as compared with \$399,000,000 for the same period of last year. The total bank deposits in Canadian chartered banks at the end of August aggregated \$1,250,000 as compared with less than \$1,000,000,000 at the end of August, 1914, and a little over \$1,000,000,000 at the end of August, 1915. The increase for the past year has thus been \$250,000,000.

The Minister of Finance, while regarding the figures as gratifying as showing the soundness of the country's trade and its general prosperity still emphasizes the need for national saving on a greater scale in order that the constantly increasing expenditures of the war may be met as largely as possible from Canada's own resources. He is of the opinion that if those not immediately engaged in the war would put forth their maximum of effort in the way of production of all kinds of agricultural and other commodities which now command such high prices and if at the same time the public would save as much money as possible the Dominion, notwithstanding the great increase which must take place in the national debt for our war expenditure, would as a community be stronger, commercially, financially, and industrially after the war is over than before it commenced and be able to easily tide over any period of dislocation or reconstruction which may follow in its wake. The true policy at the present time as stated by the Minister is one of individual and public economy resulting in greatly increased savings. In order that the public may be able to readily invest these savings in the national securities, which are the highest class of all and yield unprecedentedly attractive rates, the Finance Department, now that the war loan has been successfully floated will in the near future make public a plan which will have for its object the promotion of greater saving among those of limited means who may be willing to save and securely invest part of their earnings and income both as a wise personal provision against the future and as a patriotic effort assisting the prosecution of the war. It is also probable that a plan will be devised whereby the investing public will be given an opportunity of temporarily investing funds in Dominion treasury debenture stock pending new war loan issues in which they may be waiting to participate. This will save for the purposes of the Dominion and Imperial Governments funds which now find their way into foreign securities. Any securities issued for the purposes specified

will be of such term, character and issue price as not to conflict with those of the first and second domestic war loan.

### BIG NICKEL DEPOSITS IN NEW CALEDONIA

AFTER a four months' stay in New Caledonia, Tasmania, New Zealand, and Australia, gathering information as to the nickel resources of that part of the world, Dr. W. G. Miller, Provincial Geologist, and Thomas Sutherland, Inspector of Mines, have returned to Toronto. The two officials left Toronto in May and the most important work of their stay abroad was the survey made of the nickel resources of New Caledonia, the only serious rival in the world for the Sudbury nickel deposits. While Dr. Miller will not make his report until next meeting of the Nickel Commission, of which he is a member, it is understood that he found the New Caledonia deposits to be vastly larger than has been generally thought. While considerable development is being carried on there by the French, great ore-bearing areas have not been touched. Even here the International Nickel Company is in evidence, some very valuable deposits in New Caledonia being owned by the company and held as a reserve.

### TRADING WITH ENEMY PROHIBITED IN ITALY

A PROCLAMATION has been issued prohibiting Italian citizens from trading with persons, institutions, or companies established in enemy territory, or territory occupied by the enemies of Italy, or the allies of enemy States; and with subjects of the above-mentioned States, wherever they may reside; third, with persons, commercial firms, or companies whose names appear on a special list. By a further decree all commercial enterprises existing in the kingdom whose managers or chief shareholders are subjects of States enemies of Italy, or allies of enemy States, are placed under the control of the Government for their eventual liquidation.

### GLASGOW TRADE FAIR

ALL the preliminaries for the British Industries Fair, to be held in Glasgow in February, are now complete. The Fair is to be on similar lines to that held at Leipzig, and is to have for its primary object the extension of Empire trade after the war. All branches of home industry are to be represented, and as the Fair is to be under the official wing of the Glasgow Corporation, success is already secured.

# The WILLIAMS Turret Lathe

Prompt  
Delivery

For Boring, Base  
Recessing and  
Nose Operation on  
Shells up to 6 in.

## SPECIAL FEATURES

2-Step Cone for 6" Belt.

Hole in spindle bored large enough to take 6" shell.

Extra large spindle bearings.

Can be equipped with 3-Jaw Universal or Air Chuck.

Long and Heavy Turret Slide, well gibbed.

Extra Large Turret ensures rigidity under heavy cuts.

Powerful indexing arrangement with automatic trip.

Four instantaneous Feeds.

Weight about 7,000 lbs.

No Friction devices are used. Countershaft is equipped with Tight and Loose Pulleys.

Write for full description and prices.

# INDUSTRIAL <sup>A</sup><sub>N</sub><sub>D</sub> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**Renfrew, Ont.**—Fire on Oct. 4, destroyed Limbleau & Son's foundry and machine shop, doing several thousand dollars' damage. No insurance was carried.

**Sherbrooke, Que.**—The Iron & Metal Supply Co., of Montreal, may locate a plant here, if satisfactory arrangements can be made with the City Council with regard to power, rates, etc.

**Windsor, Ont.**—Engineering plans for preliminary construction of the steel plant at Ojibway are nearing completion, although it is unlikely any actual building of mills will be started before next spring.

**Vancouver, B.C.**—If satisfactory arrangements can be made with the city, the Vancouver Shipyards, an old-established firm on Coal Harbor, proposes to extend its plant and construct steel steamers.

**Kitchener, Ont.**—The Canadian Buffalo Forge Co. started work last Thursday on additions that will double their capacity. The improvements will cost over \$100,000. It is expected to have the building completed by December 1st. The new building will be 150 ft. by 100 ft.

**Winnipeg, Man.**—The Greater Winnipeg Water District Commissioners will call for tenders for the construction of an addition to the engine shed at Deacon, at an estimated cost of \$4,000, and for the erection of a small engine shed at the eastern terminus, at a cost of \$1,200. Chairman, R. D. Waugh.

**B. C. Copper Co.**—General Manager Oscar Lachmund, of the B. C. Copper Co., states that company is installing a plant to raise water from Similkameen River to furnish power for mine equipment and experimental mill. New main tunnel now in 1,000 feet level, has crosscut one end of ore body, and drift is now being run.

**Kingston, Ont.**—The smelter and mine belonging to the North American Smelter Co., has passed into the hands of a New York syndicate on a lease with option to purchase. Repairs have already been begun on the smelter and it is hoped to have it in active operation by December 1. The company which has taken over the property has been incorporated and will probably be known as the King-

ston Smelting Co. Alexander McKinnon is the engineer in charge.

**Galt, Ont.**—A contract has been let to P. H. Secord and Sons, of Brantford, for a large addition to the north works of the Goldie and McCullough Co. The building is to be 60 by 144 feet of fire-proof construction, and will cost \$15,000. The work is almost completed on the new \$20,000 power house at the south works of the same company.

**Galt, Ont.**—A permit has been taken out for an addition to the plant of the Wells Bros. of Canada, manufacturers of taps and dies, on Front street. The addition will be 30 by 40 feet, of two storeys and constructed of brick. The estimated cost of the new building is \$2,000. Thomas and Hancock have the contract for the addition.

**St. John, N.B.**—The first unit of the T. MacAvity & Son new plant at St. John, N.B., is now completed, and operations are under way looking to the output of a small order of 8-inch shells. As soon as the latter are finished, additional equipment, now being installed, will, with that already in service, start on a large contract for the machining of 9.2-inch shells.

**Galt, Ont.**—The decision of the Dodge Metal Hose Co., of Canada, Ltd., to erect a \$50,000 plant here assures another new industry for Galt. The company is organized under Dominion charter, with an authorized capital of \$150,000. The company will manufacture malleable iron hose to replace rubber hose used to couple air line between railway cars, and also has Canadian patents on five other articles. Land has been purchased on Beverly Street, and plans are being prepared for a modern factory by John Evans, architect. James R. Cameron, of Toronto, is to be works manager.

## Electrical

**Petrolea, Ont.**—Hydro light and power from the Petrolea sub-station was turned on the Wyoming system on October 4.

**St. Thomas, Ont.**—The Hydro-Electric line from the Kent sub-station to Sarnia, which will supply that town and district with hydro service, has been completed.

**Fort William, Ont.**—A by-law has been passed releasing to the Slate River Local Telephone Co., the rights for the

telephones in the township owned and operated by the city. The company intends to spend \$1,500 extending lines throughout the district.

## Municipal

**Sarnia, Ont.**—The City Council will investigate the cost of installing an incinerator plant.

**Richmond Hill, Ont.**—A by-law will be submitted to the ratepayers in January which will enable the municipality to instal a modern water system.

**Guelph, Ont.**—Engineer F. McArthur has made a report recommending an expenditure of \$75,000 on waterworks improvements.

**Port Arthur, Ont.**—A by-law to grant certain concessions to Aimwell G. McIntyre, who proposes to build a chemical pulp mill in Port Arthur, will be voted on by the ratepayers on October 23.

**Fort William, Ont.**—The City Council have decided to have plans drawn for a subway on Yonge street at an estimated cost of \$250,000.

**Redcliffe, Alta.**—The Town Council are considering the question of installing a steam or gas engine and pump in the municipal power plant. Extensions may also be made to the water main system.

**Township of Hibbert, Ont.**—A by-law will be submitted to the ratepayers on October 16 to raise \$5,000 to provide for the cost of a plant to distribute electric power to be supplied by the Hydro-Electric Power Commission for the police village of Dublin. James Gordon, township clerk.

**Toronto, Ont.**—The York Township Council have made satisfactory arrangements with the Hydro Commission's engineers with regard to the supply of light for the township. The council have accepted the engineer's report, authorizing the construction of water mains on Eglinton avenue, Runnymede and Weston roads.

## General Industrial

**Montreal, Que.**—The Smardon Shoe Co. will build a factory here.

**Fort William, Ont.**—The Canada Starch Co. have commenced work on an extension to their factory here.

**Calgary, Alta.**—The Calgary Silver Plating Works has been organized here.

**Acton, Ont.**—The Reliance Shoe Co. will build a factory here if the proposed by-law is passed.

**Lindsay, Ont.**—Flavelle's, Ltd., produce plant was badly damaged by fire on Oct. 5. The power plant was damaged, but not destroyed.

**Montreal, Que.**—Work will begin soon on the foundations of the factory addition for the United Shoe Machinery Co., at Maisonneuve.

**Toronto, Ont.**—The Canadian National Carbon Co. will build a factory here.

The John V. Grey Construction Co., Toronto, are the contractors.

**Vancouver, B.C.**—The Colonial Pulp and Paper Mills, Ltd., in which Geo. F. Whalen, Vancouver, is interested, are going ahead with the erection of a large plant at Quatsina Sound, B.C. The first unit will have a capacity of 60 tons of sulphite fibre per day.

## New Incorporations

**Hamilton Brass Ltd.**, Hamilton, has been incorporated with a capital of \$40,000.

**W. E. Clark, Ltd.**, Toronto, Ont., has been incorporated with a capital of \$40,000, by W. E. Clark, J. F. Coughlin and F. P. O'Hearn, to manufacture brass, steel, iron and metal products.

**National Bronze, Iron & Engineering Works, Ltd.**, has been incorporated with \$750,000, by L. A. David, J. S. Lamarre and E. C. Baker, to carry on the business of mechanical and electrical engineers.

**John MacGregor Ltd.**, has been incorporated at Ottawa with capital of \$100,000 to carry on business as contractors and engineers at Fort William, Ont. Incorporators are F. G. Bush, G. R. Drennan and A. G. Yeoman all of Montreal.

**Graphite Products Ltd.**, has been incorporated at Ottawa with a capital of \$500,000 to purchase and develop graphite mines. Head office is at Montreal and the incorporators are L. A. David, S. R. H. Bush and J. S. Lamarre, of Montreal.

**The Canadian Lamp & Stamping Co.**, has been incorporated at Ottawa with a capital of \$100,000 to manufacture steel and other metal products at Ford, Ont. Incorporators are George E. Edmunds, William T. Jones and Lawrence H. Bedford all of Detroit, Mich.

## Contracts Awarded

**Toronto.**—The Chapman Valve Mfg. Co., Toronto office, have been awarded a contract for a 36-in., gate check valve by the Board of Control.

**The American Water Softener Co.**, Philadelphia, Pa., have been awarded a contract for a mechanical filtration plant by the Town Council of New Toronto, Ont.

**Toronto, Ont.**—The Peter Lyall Co., who are building the new Union Station, have awarded the contract for reinforced concrete fireproofing to the Crescent Con-

crete Co. of Toronto. The contract amounts to over \$100,000.

**Galt, Ont.**—The general contract for the erection of a factory addition for the Galt Paper Box Co. has been let to Thomas & Hancock. Approximate cost, \$4,000.

**Transcona, Man.**—The contract for the construction of the new 1,000,000 bushel transfer grain elevator has been let by the Department of Railways, Ottawa, to Fegles Bellows & Co., of Fort William. Estimated cost, \$500,000.

**Winnipeg.**—A contract for street lighting equipment has been awarded

### An Ideal Locker for Clothes and Personal Tools

This combination Tool and Clothes Locker will be very useful to the mechanic because it provides ample space for clothes and a safe place for his tools.

Built for life-time service. Supplied in unit or group construction.

protect the west side of Port Stanley harbor, and work is to be undertaken by the contractors at once. The cost will be in excess of \$100,000 and the work will occupy many months.

## Trade Gossip

**British Columbia** produced a record amount of copper in 1915, being over 5,000,000 pounds greater than the next highest year, 1912. The total production was almost 57,000,000 lbs.

**The Herbert Morris Crane & Hoist Co., Toronto**, have been awarded a contract for a 5-ton hand operated travelling overhead crane by the Board of Control, Toronto.

**The Canadian Boomer & Boschart Co., Montreal** have received orders for hydraulic pumps, presses balers and accumulators from the Ha Ha Bay Sulphite Co., and the Ouatichouan Falls Paper Co.

**Measures Taken to Protect Shipping.**—Measures, which it is expected will be sufficient to protect Canadian shipping and vessels in the Canadian Atlantic service, are being taken by the Admiralty in co-operation with the Canadian Government. No suggestion as to the nature of these measures is available or could be published.

**Newfoundland** has copper ores, some running from 4 to 30 per cent. copper, with which little was done until after the war broke out. The production in 1915 was about 15,000 tons, or which 12,150 tons, worth \$151,372, went to the United States, and the remainder to England, as against about 2,000 tons as the 1914 output, valued at \$15,000, and all taken by the United States.

**Montreal, Que.**—It is reported that rush orders have just been placed at Pittsburgh for steel to complete a new span in the Quebec bridge to replace that which recently fell into the St. Lawrence River. The Dominion Bridge Co. has placed a contract with the American Bridge Co. to fabricate the new span and the Carnegie Steel Co. will roll 5,000 tons of steel shapes and beams at its Homestead plant.

**Canadian Dollar on Paris Exchange.**—The Canadian dollar is now being quoted on the Paris Exchange. This has been done by the French Minister of Finance and the brokers' syndicate, at the request of Canadian exporters, many of whom have representatives now in Paris. The occurrence of wide fluctuations in the exchange markets makes this move of interest to Canadian export firms.

**Marine Insurance Rates Advanced.**—Marine insurance rates from American

Steel Shell Forgings or Billets of any size or weight will move any distance or about curves upon our specially constructed Gravity Carriers and Incline or Horizontal power devices. No labor required.

to English ports on Monday jumped from 1 to 5 per cent. in consequence of the German submarine operations. Rates to Havre and Bordeaux were increased from five-eighths to three-quarters of one per cent. to five per cent. Some brokers were asking for trans-Atlantic insurance as high as 10 per cent., and others refused to quote rates at all.

**C.N.R. Terminals.**—Sir Donald D. Mann, vice-president of the C. N. R., stated recently that excavations at the Dorchester street terminal site at Montreal will be begun in November, and in about four weeks' time tenders will be asked for the construction of the La-gauchetiere street station, as the plans will then be ready. The construction will be chiefly of concrete, and it is expected that regular trains will be running through the tunnel by the 1st of May.

**Railway Commission Returns East.**—Sir Henry Drayton and A. H. Smith, of the commission which is to report on the railway situation in Canada, have returned to Ottawa from a trip through the West and an inspection of various Western lines. The journey was part of a general examination as to location, physical condition and operation. A similar examination was made by Mr. Smith in the East some weeks ago. A more thorough and detailed examination is being made by the commission's engineering staff. The commission will report before the close of the next session of Parliament.

**Trade Affected by Shipping Shortage.**—W. J. Egan, Canadian Trade Commissioner in South Africa, reports Canada's exports to South Africa for the first six months of the year are about \$22,000 less than the same period in 1915. He says it is due to lack of shipping. He points out that the United States has in the same period increased its trade with South Africa over that of 1915 by about \$5,000,000. He adds the apparently just complaint in view of Canadian difficulties to secure shipping that nearly all this American trade was carried by British-owned vessels.

The Dominions Royal Commission will sit at Montreal from October 27 to 31, both days inclusive. The Board of Trade has granted the use of its council chamber for the sessions, which will be held there each morning and afternoon. During their stay evidence regarding immigration, railways, steamship services, ocean insurance, bills of lading, statistics, Empire development, telegraphs and cables, control of ocean rates, freights and bills of lading, the Panama Canal, Empire trade marks, asbestos resources, commercial laws, forests, harbors, irrigation and water powers, minerals, circulation of American publica-

## Personal

**Col. Thomas Cantley**, president of the Nova Scotia Steel & Coal Co., purposes sailing for England about October 15th.

**Redmond Quain**, a director of the Ottawa Electric Railway Co. and Ottawa Car Co., died at Ottawa on October 5, aged 56.

**Capt. F. R. Newman**, late manager of the Canadian Fairbanks-Morse Co.'s sales office in Toronto, has been wounded in France.

**W. G. Ross**, chairman of the Montreal Harbor Commissioners, has been elected president of the American Association of Port Authorities.

**J. E. Ryan**, formerly with the Rudel Belnap Co., has been appointed sales manager for Montreal Machineries and Supplies, Ltd., Montreal.

**George W. Cook**, general foreman of the Pere Marquette shops at St. Thomas, Ont., has resigned. Mr. Cook had been with the company since 1904.

**Sir Alfred Bateman, K.C.M.G.**, has arrived at Quebec on the steamer Scandinavian, en route for Ottawa, to join the Dominion Royal Commission.

**J. Howard Jackson**, head of Jackson & Co., civil engineers, died on October 7. He was born in England in 1847, and went to New Zealand in the early sixties. He came to Brantford in 1912 to join his son in the engineering business.

**John Power**, who for 33 years was superintendent of the Montreal Gas Works, passed away in that city on October 4, at the age of 81. Mr. Power was an Irishman by birth, and came to Canada in 1860. He retired as superintendent of the gas works in 1895.

**Erastus Long**, president of the E. Long Mfg. Co., Ltd., Orillia, Ont., died on Oct. 4, aged 48. Mr. Long was one of the most prominent and public spirited citizens of Orillia. He has been chairman of the Orillia Water, Light and Power Commission since its inception four years ago.

## Railways--Bridges

**Montreal, Que.**—Plans will be prepared for widening the subway under the G.T.R. on Wellington street, and also three other subways. The City Council have appropriated \$18,600 to cover the cost of plans. Chief Engineer Mercier has charge of the work.

## FOR SALE

**16 H.P. IDEAL GAS ENGINE — ALSO** quantity of pulleys. Chipman & Millman, Brantford, Ont. (16)

**6½ H.P. WESTINGHOUSE AND 1.3 H.P.** Toronto & Hamilton Electric Co. 60-cycle motors, in first-class order. Geo. H. Lees & Co., Hamilton. (17)

**FOR IMMEDIATE SALE, TORONTO—3,000** feet seamless steel tubing, 1½" O.D. by 5-32" wall. No reasonable offer refused. Box 227, Canadian Machinery. (15)

**FOR SALE—2 2" MURCHEY COLLAPSIBLE** taps for nosing shells; 1 No. 6 2" collapsible tap; maker, The Manufacturers' Equipment Co. McGregor & McIntyre, Toronto, Ont. (14)

**FOR SALE — STEEL WATER TOWER,** without tank, 94 feet high. Will support tank holding 13,000 gallons. Cost new \$1,600.00. Will sell for \$350.00 f.o.b. Shawinigan Falls, P.Q. Northern Aluminum Company, Limited.

**BRASS RODS, 1¼, 1½, 1¾ UP TO TEN FT.** Brass tubings, 2½ o.d., with ¼ wall; all lengths to ten feet. Louis Lovitz, 185 Markham St., Toronto. Telephone College 3711. (17)

**FOR SALE—ONE 2 H.P., 60-CYCLE CHAP-** man & Walker motor, single phase, 110 volts, or will exchange for a 2 H.P., 25 cycle motor, 550 volts, three-phase. Address The R. S. Bickle Company, Woodstock, Ont. (14)

## For Sale Cheap

- 1—Box Girder Type Overhead Hand Power Crane, 48' 6" span, 5 tons capacity; complete, less the Hoist. This is a good Crane for Foundry, Boiler Shop, Storehouse, Stone Yard, etc.
- 1—12" Single "I" Beam Overhead Hand Power Crane, 30' 10" span, 3 tons capacity; complete, less the Hoist.
- 1—Brantford (Gas) Bake Oven and 4 Racks.
- 1—Linderman 2-Spindle Boring Machine.
- 1—26" Drill, London Machine Tool Company.
- 1—Bowser 40 Gal. Varnish or Oil Pump and Tank.
- 11—New 1-13/16" High Speed Twist Drills, No. 5 Morse Taper Shank.
- 30—Used 1-13/16" High Speed Twist Drills, No. 5 Morse Taper Shank.

**M. BEATTY & SONS**  
Limited  
Welland, Ont.

**FOR IMMEDIATE SALE, TORONTO—3,000** feet seamless steel tubing, 1½" O.D. by 5-32" wall. No reasonable offer refused. Box 226 Canadian Machinery. (15)

**BUSINESS FOR SALE — MACHINE SHOP** with a good, steady run of work and always busy. A good opening for a young man to get into business. Owner has other interests. Box 224, Canadian Machinery. (13)

**1-2-SPINDLE SHAPER, WOOD TOP, JOHN** Ballantyne, Preston, make, used two months. 1 Dynamo, 45 lights, Toronto and Hamilton Electric Co. make. Used five months. Good as new. Box 195, Jordon, Ont. (R.T.F.) (14)

**FOR SALE.—ONE BROWN-BOGGS MARK-** ing Machine, suitable for 6" Mark XVI. or Mark III, English Shells. Only object in selling is that other methods of marking have been adopted. Price on application. Taylor-Forbes Co., Ltd., Guelph. (14)

**ONE REED TURRET LATHE, 8' BED,** swing 28"; 4 2" holes in turret. This machine is in first-class condition and was only used on 3,000 shells. Is a very powerfully built machine and will bear fullest investigation. Box 226, Canadian Machinery. (16)

**FOR SALE—ONE 16" x 8' HENDEY LATHE,** with taper attachment, \$1,100.00; one 22" x 10' Blaisdell lathe, with taper attachment, \$1,300.00; one 24" Gould & Eberhardt shaper, \$800.00. The above machines are in first-class condition. For particulars apply Box 221, Canadian Machinery.

**FOR SALE—BOILER REPAIR AND SHEET** iron works. Fine opening, one of the best in Canada, for a good man. Only repair shop in county. Equipment alone will list at nearly \$2,000. Will sell for \$1,200. Write for particulars. Box 213, Canadian Machinery.

**WE HAVE FOR SALE THE FOLLOWING** equipment: Complete nickel and copper plating plant, including direct connected dynamo and motor; one second operation cast iron plug machine, and two first operation cast iron plug machines manufactured by the Brown Engineering Corporation; 2 16-inch turret lathes; 1 36-inch engine lathe, 20-foot bed. The above outfit will be sold en bloc or separate. Apply direct to Foundry & Machine Co., Ltd., Montreal. (12)

**FOR SALE—McDOUGALL ENGINE LATHE.** 20" swing, 10' bed; never been used. Baker Keyseater No. 2, good as new. Boring Mill, 2 bars, will bore up to 30" dia. Boston Forge Blower, 27", good condition. Crescent Swing Cut-off Saw, almost new. 7½ H.P. Westinghouse D.C. Motor, in good order. Gurney Platform Scale, 2,000 lb., 16" wheels. Mandrills. Couplings. Hangers. Post Boxes. Pulleys. Belting. Cap Screws. Bolts, etc. Special prices on above, write for particulars. Winnipeg Machinery Exchange, Sutherland and Gladstone Sts., Winnipeg, Man. (14)

**GAP LATHE — LONDON TOOL CO. —** swings 41" in the gap, 26" over shears, 20 ft. bed, rod and screw feed, compound rest, steady rest, countershaft, 2 face plates, 4-jaw chuck, weight about 10,000 lbs. This tool has been very little used, and is in excellent condition. Bargain for quick sale. Winnipeg Machinery Exchange, Sutherland & Gladstone Sts., Winnipeg, Man. (17)

## REPAIRING

**ALL KINDS OF MACHINERY REPAIRED,** rebuilt and installed. W. H. Sumbling Machinery Co., 643 Yonge Street, Toronto, Ont.

## WANTED

Burned out Tungsten Lamps, late type, drawn wire, 25, 40, 60 and 100 Watts, 110 and 115 volts.

**DOMINION TUNGSTEN LAMP FACTORY**  
ST. CATHARINES, ONTARIO

## SITUATIONS WANTED

**TOOL MAKER IN CHARGE DESIRES** change. Competent to take charge of machine shop or tool room. Good references. Box 225, Canadian Machinery. (17)

**SUPERINTENDENT—FIRST-CLASS PRACTICAL** mechanical man is open for an engagement as works manager or superintendent. Can give best of reference as to character and ability to handle help and produce results. Box 227, Canadian Machinery.

**ARE YOU LOOKING FOR A SUPERIN-** tendent? There's money in making shells, if you know how. If you don't, let me make them for you, any size. I'm open for a contract with any concern that is looking for a live wire production Superintendent. Address Box 230, Canadian Machinery. (13)

## WANTED

**WANTED — 250-VOLT D.C. GENERATOR —** 75 to 150 k.w., direct connected to steam engine; must be in good condition. Write to The Kaufman Rubber Co., Berlin, Ont. (13)

**WANTED TO MANUFACTURE A FEW** lines of metal products, sheet metal preferred. We have complete equipment for high-class work. Give complete description and rating in first letter. Apply Box 221, Canadian Machinery. (17)

**WANTED—12" BAR ROLLING MILL TWO** or three high with steam drive. One three-ton Steam Hammer. One half-ton Steam Hammer. One pair Rolling Mill Shears. With full particulars and lowest price. Apply Box 218, Canadian Machinery.

**FOREMAN FOR LARGE WINNIPEG MA-** chine shop — must be aggressive and mechanic with good practical experience in jobbing, stock and transmission work. When applying, state age, experience and salary expected. Applications treated confidentially. Box 229, Canadian Machinery. (16)

**SUPERINTENDENT FOR 45 SHELL FAC-** tory all equipped and tooling for 400 to 500 shells per day. Shipping since May. Must have ability to thoroughly organize, and be capable of producing maximum results in short time, and have previous shell experience. To the right man we will pay a liberal salary and bonus. State fully (in confidence) past experience, present record and salary expected. Box 228, Canadian Machinery. (14)

# Factors Contributing to Maintenance of Press Work Efficiency

Staff Article

*The attainment of maximum efficiency, in any line of manufacturing effort, can only be accomplished through the systematic study of operative and constructional details, resulting in the elimination of undesirable features and replacing them with methods and appliances adapted in detail to the particular case, but which in principle can be applied to any given case. Factors controlling the adaptability of tools to a number of different machines are treated from the standpoint of actual shop conditions in the following article.*

**W**ITHOUT going deeply into the details of die construction, there are a few features in connection with the general design of sheet metal tools that are often overlooked when the tool-maker starts to work upon the die. While the operation of many press tools requires machines of special design and lift of ram, it is only those of ordinary make and lift that are here referred to. In press rooms where a large variety of work is handled, it is often necessary to use a certain tool in a number of different presses, owing to the one previously used being occupied on another operation. Under these conditions it is essential that the various tools be placed in the different presses, with the minimum amount of ram and bolster plate adjustment.

## Height of Punch and Die.

With few exceptions work corresponding in character is performed in the same or similar presses, and for this reason it is advisable that the die can be used in any of the presses. To do this satisfactorily, the height ( $h$ ) Fig. 1, when the crank is at its lower extremity, should be greater than the height ( $h$ ) Fig. 2, contained between the top of the punch and the lower surface of the die, when these are in a finished position. Therefore, one of the chief factors to be taken into account when designing a punch press die, is due con-

sideration in regard to this overall height; otherwise it may be found from the base of the die, or the top of the punch, after the tool is completed; often destroying the stability of the die, and consequently its efficiency. Some-

FIG. 2.

times it is found that after being in operation for some time, a die will not go in a certain press, owing to insufficient ram adjustment, even when the pitman is screwed to its shortest possible length. To operate the tool in this particular press, metal is removed as above stated, and unless great care is exercised in doing this, the accuracy of the die may be destroyed. For example, if stock is cut from the upper surface of the punch block, a condition as shown at B, Fig. 10 may result; where the recut face is not square with the punch shank, and consequently does not bear firmly against the face of the ram.

## Location of Clamping Holes

Next to the consideration of uniform height of dies (as far as possible), for the rapid setting of press tools, is the maintenance of standard dimensions for the relative position of the clamping holes in the various tools used on the different presses.

Wherever possible, all bolsters and die beds (especially the latter), should be made from standard patterns and in as few sizes as the nature of the work will permit; the upper portion of the die being constructed to suit the work required. Frequently when a pattern for a die bed has been constructed, and after the various sections have been placed in position to suit the operation, lugs have been added for clamping, without consideration to distance of location with the result that the position of the holes for the clamping bolts will often come close up to a shoulder, or on the very edge of the casting. Upon placing this same die in one of the other presses, it may be necessary to either drill new holes or extend those already drilled, so that the bolts will enter. In many cases this is due to the die setter failing to re-adjust the bolster plate to conform with the new die. However the chief cause of this objectionable feature is generally a lack of system in locating clamping holes.

It is true that occasions will arise when set rules cannot be strictly adhered to, but, under ordinary conditions, the clamping holes in the die should be on the same centre-line as the punch shank, as indicated in Fig. 3; and where four holes are used they should be

FIG. 1.

FIG. 3.

located as shown at b,b,b,b; or if preferred, on the two centre lines cd and xy.

#### Using a Clamping Jig.

For the convenience of locating these holes in the dies, and maintaining a high degree of accuracy, a jig similar

FIG. 4.

to that shown in Fig. 3 will prove very serviceable. This device is applicable to the various sizes and styles of die beds, one being required for each of the several sizes. As the distance *l* on either side of the punch shank is equal, it is obvious that the die can be reversed and still retain its relative position. By using a short piece of round stock in the ram, the jig can be adapted for laying off the corresponding holes in the bolster plate this latter being located in a central position. Where frequent changes of dies are necessary, this systematic method of locating holes will be found of inestimable value.

#### Clamping in Position

The efficiency and life of a die depends largely on the care that is given to the holding facilities. In addition to bolting the die firmly to the bolster, it is essential that every precaution be taken to guard against the possible creeping of the die, with the continual jar of the working. To avoid time and expense, of the penny wise and pound foolish sort, some tool makers allow

FIG. 6.

dies to go to the press room that have not been machined on the upper surface of the clamping portion. Under no conditions can it be expected that the rough surface will be parallel to that resting on the bolster plate, therefore it is reasonable to expect that there is the tendency, be it ever so small, of the die creeping from its initial position.

When washers are used beneath the head of the bolt, they should be of substantial thickness, as shown at D, Fig. 4, and the nearer the bolt is to the centre of the hole, the better will be the results. If, as shown at B, Fig. 4, the bolt comes in such a position that it

bears against the side of the hole, as at E, the pounding of the punch may cause the die to shift in the direction indicated by the arrow. This action would be increased by the use of too small, or too thin a washer, as the clamping pressure at F must be less than that on the opposite side. When this condition takes place, it is common practice in some shops to drill the hole out larger, as shown at C, and while the bolt is freed from direct contact

with the side of the hole, the possibility of the die shifting has not been materially reduced, unless a much larger and thicker washer is used.

#### Use Heavy Clamps

It is often required to secure a die by means of a clamp, instead of a bolt passing directly through the body of the die.

FIG. 5.

In such cases, the clamp should be heavy enough to withstand the pressure without bending, and should be placed in a horizontal position, as shown to the left of Fig. 5; the block A being the proper thickness for the desired purpose. The bolt should be close to the work, but not touch it, and the bearing at B should be wide, and parallel with the lower surface of the die. A condition as shown at the right should always be avoided, as the tendency of the die to creep in the direction of the arrow must be very obvious.

#### Die Construction

The design of a die would naturally be that best adapted for its particular purpose, but in order to briefly describe the component parts of the ordinary blanking and drawing die, and also the plain blanking die, the sketches Figs. 2 and 6 are shown. To provide a long bearing for the center post A, the die has a boss B on the base; this portion also furnished ample support for the push pins C, C, which are sometimes subjected to considerable compression owing to the action of the rubber that supplies the pressure required for the drawing

operation. The draw ring D rests upon the push pins C, and should be thick enough to stand the strain of the draw without bending. If this ring is too weak, or the number of push pins is insufficient, the additional pressure directly over the pins may cause "lugs" to

FIG. 7.

form on the finished product. The retaining shoulder on the inner diameter of the ring should allow the upper or draw surface to come just above the cutting edge of the die. The top of the post A should be slightly below the cutting edge of the die, as this permits the flat stock to be held firmly between the punch and the draw ring while being cut, the drawing operation being performed as the punch proceeds downwards. The knockout E, which also forms the upper impression in the sheet metal cap, ejects the latter on the upward stroke, by means of the spring F, the pin G preventing the knockout from coming out of its position. To insure a good bearing of the punch H upon the face of the ram, it is a good plan to cut a small groove at the base of the shank, as shown at I.

When turning the cutting ring J, it is advisable to cut a shallow recess in the base, to reduce the grinding necessary, and also add to the holding qualities.

FIG. 8.

The steel ring should be hardened and ground before the cast iron bed is checked to receive it, as the shrinkage due to hardening, and subsequent grinding would mean a loose fit, if the parts were fitted earlier.

#### Holding Circular Dies

In the construction of some circular

cutting dies, it is common practice to hold the cutting ring to its seat by means of a nut, fitted to a threaded portion of the die bed below the steel die, as shown in Fig. 6; the clamping portion being machined at an angle of 45 degrees, the most suitable angle for the purpose. By this method it is possible to remove the cutting ring for regrinding without removing the die from the press.

FIG. 9.

When securing the steels of sectional dies in position it is important that the bearing on the base should be perfectly flat, to avoid any possibility of rocking motion, which is often more pronounced in this type of die. In addition to having a good firm bearing it is also frequently advisable to locate the clamping screws (a) (a) Fig. 7 a little more than half the distance back from the cutting edge. When the pressure required to cut the stock comes upon the die, there is a tendency for the cutting edge to move inwards, as shown by the arrow, therefore the leverage from the cutting edge to the clamping screw should be as great as circumstances will permit. An exaggerated condition of the punch after a series of blanks have been cut is shown at (b) and will demonstrate the action of the die, when in operation.

#### Upsetting and Repairing Dies

A feature of press work that requires careful attention is the repairs which are necessary to maintain the tools in good working condition. Individual cases must be treated according to their own particular needs, and the repair man

FIG. 10.

will require to use his best judgment, as each occasion may demand. A few of the elementary factors are here cited. Probably the most common call on the tool room is the refitting of a worn die. Where soft punches are used it is customary to upset and re-turn them. To

do this satisfactorily, a solid block should be provided, with a hole in the centre large enough to receive the punch shank freely as shown in Fig. 8. A large worn out die is often most useful for this purpose, one that will give a good solid bearing to the back of the punch block. Before upsetting the punch, it is advisable to cut a shallow recess in the face as shown at C, Fig. 8. This permits the upsetting to be accomplished more easily, the result being as shown at D. If the face is not first cut away the shape, after upsetting, would be similar to that at E.

#### Grinding the Shear

In grinding and regrinding the shear on the face of cutting dies, the general practice is to allow about the thickness of stock, as indicated at F, Fig. 9. In addition to the shear, a slight rake, as at A is also given. If the clearance B is excessive, and extends right up to the

FIG. 11.

cutting edge, any undue shear would result in an uneven blank as shown at G; the inner dotted circle representing that cut by the high points, and the outer dotted circle that cut by the bottom of the shear, the heavy line being the true outline of the blank. To offset this, a portion of the inner surface at E is ground to give very little clearance.

Unnecessary repairs are often occasioned by a condition similar to that shown in Fig. 10, where one side of a die is in action in advance of the opposite side. This causes the punch and die to be forced in the direction of the arrows, and this action is more pronounced as the cutting edges, become dull, the punch will gradually be sheared at the point A.

#### Turning Punches.

When turning a punch to fit the die, it is usually held in a chuck that is secured to the face plate of the lathe as shown in Fig. 11. Where the chuck is exclusively used for central work, some

tool makers prefer to have a shallow boss B on the back that fits into a recess cut in the face plate. Before starting work on the punch, care should be taken that the face C runs perfectly true, to insure accurate alignment when placed in the press. This may be aided by filing

FIG. 12.

a tapered portion D on the shank, so that the pressure of the screw will drain the punch firmly against the face of the chuck.

For the repairing of dies, two very useful tools are shown in Fig. 12; that on the left being a special soft headed hammer for use on finished parts. The pieces (c) can be made of leather or any kind of soft metal and held in position by the nut (b). The tool to the right is used for upsetting punches without striking the cutting edge. By making the shank (a) extra long punches can be upset while in the press.

#### MORE CANADIAN MUNITION ORDERS

MUNITION orders placed in Canada since the outbreak of the war amount to \$550,000,000. An order for munitions to the value of \$60,000,000 has just been received and contracts to that amount are to be placed. Since the first of the year orders have been placed amounting in value to \$185,000,000.

These figures were made public on Oct. 11 by the Imperial Munitions Board. During the months of July and August the output from Canadian industries was interrupted by reason of the difficulty experienced in procuring the necessary steel and forgings. The board is now pleased to state that, due to the efforts put forth by manufacturers, the output on most contracts is more satisfactory and increasing in volume each week.

The quantity of shrapnel shells now produced each week, complete with cartridge cases fuses, primers and propellant charge, has reached almost 250,000 and

the board has been authorized within the past week to place continuation orders for this size of shell into 1917. Large orders were placed during last spring and summer on the larger sizes of shells, especially 8 in. and 9.2 in. This involved complete new installation of machinery and equipment. Many of these plants have now commenced operating, and the output of larger-sized shells is increasing each week, and will continue to increase until about January 1st, when the maximum output of the plants should be reached. The position in Canada in regard to steel, the basis of all munition work, is now such that no interruptions in output will likely take place, as the immense tonnage required for all classes of shells has been arranged well ahead. The fuse plant built by the board in placing new business will be to keep all plants now producing munitions fully employed, and where increased production is required on any particular class of work to extend the operations of plants which are already equipped and producing.

### BIG INCREASE IN DOMINION REVENUES

HEAVY increases in revenue receipts, evidences of the steadily mounting cost of the war and the total of the net debt, together with a slight decrease in domestic expenditures, are reflected in the Dominion financial statement issued recently. This statement gives the figures for the month of September and for the first half of the current fiscal year.

During the six months revenues have increased by over thirty millions as compared with the corresponding period of last year. Expenditures on consolidated account have increased by three and a half millions, while those on capital account have decreased by five and a half millions. During the six months Canada spent sixty millions more for war than she did during the corresponding period last year, while her expenditure for the month of September is just double what it was in September, 1915. At present the war is costing the Dominion just about a million a day. Since September, 1915, the net debt has been increased by nearly \$200,000,000. At the end of last month it stood at \$680,275,444, as against \$484,841,633 on September 31, 1915. The increase in the debt for the month alone was over twenty millions as compared with August.

#### Nation's Revenue

The total revenue for the six months is \$103,589,680, an increase of \$30,346,166 over the corresponding period last year. Customs receipts are responsible for twenty millions of the increase. Excise for two million; post office for \$800,000; railway receipts for five millions, and miscellaneous for over a million.

For the month of September revenue receipts increased by six and a quarter millions as compared with September, 1915. Customs are responsible for three and a half millions of this increase, excise for half a million; post offices for \$450,000, and railway receipts for three-quarters of a million. On consolidated fund account (ordinary expenditure) there was spent during the six months \$49,757,711, as against \$46,271,622 for the corresponding period last year, or an increase of three and a half millions. This increase is nearly all accounted for during the month of September, and may be due to extra interest charges on the debt.

#### Over Two Millions Saved

On capital account (public works, etc.) a total of eleven millions was spent during the six months, as against sixteen and three-quarter millions for the corresponding period last year, or a saving of five and three-quarter millions. The net saving on domestic expenditure, during the six months, has, therefore, been about two and a quarter millions. During the six months, \$104,538,895 was spent on war, as against only \$44,427,893 for the corresponding period of 1915, or an increase of \$60,111,002. For the month of September alone, a total of \$28,228,176 was spent on war, which is fourteen millions more, or just double what was spent in September, 1915.

Figures showing the funded debt of the Dominion indicate the changed character of Canada's financing superinduced by the war. Of this funded debt over \$75,000,000 is payable in New York. On September 30, 1915, Canada had nothing payable in New York. On Sept. 30, 1915, Canada had only \$757,960 of a funded debt payable in the Dominion. To-day she has a total of \$118,645,070. Her funded debt payable in London totals to-day 470 millions, as against 362 millions in September, 1915.

### SHIPBUILDING ON PACIFIC COAST

FROM Prince Rupert on the north to San Diego on the south come reports of shipbuilding activity, and the hum of industry is heard in all the shipbuilding yards of the Pacific Coast, where, it has been estimated, that steel and wooden ships are under contract or construction of a value of \$75,000,000. There is every reason to believe that this encouraging condition will continue for a long time to come.

In the Pacific North-west, steel and wooden ships are being constructed, for contracts are in hand for their construction, reaching a total cost of \$30,000,000. This estimate includes the work reported from yards in British Columbia, Puget Sound, Grays Harbor and the Columbia River, and is certainly a splendid showing for the shipbuilding of the Pacific

North-west as well as foreshadowing a healthy and most encouraging revival in this most important industry. The preponderance of the tonnage being built is foreign, Norway leading with most of the steel steamships, although two of this class are being built for the Atlantic coastwise trade. The wooden ships are mostly for American owners, although the Government of British Columbia by offering a subsidy is greatly stimulating the industry so that it is forging ahead and may soon take the lead for this class of ships.

### RATES TO BE PAID CANADIAN SEAMEN

AN Order-in-Council has been passed providing regulations for the enlistment of men "in the Royal Naval Canadian Volunteer Reserve" for overseas service in the Royal Navy. The men enlisting will be enrolled for the period of the war. Ordinary and able seamen will receive \$1.10 per day; leading seamen, \$1.20; petty officers, \$1.40, and the chief petty officers, \$1.90.

Men subsequently transferred to stoker ratings will be paid 10 cents per diem more than the pay of their equivalent seamen ratings. Wives and approved dependents of men enrolling will be paid from the date of enrollment separation allowance on the following scale: Wives and approved dependents of ordinary seamen, able seamen, leading seamen and equivalent ratings, \$20 a month; petty officers and chief petty officers and equivalent ratings, \$25 per month.

### B. C. SHIPYARDS BUSY

WORK in the British Columbia shipyards is going ahead at full speed. At the Victoria plant of the Cameron-Genoa Mills Shipbuilders, the operation of lining up the third keel for the schooner to be known as the Esquimalt has been completed. Each of the vessels will cost when completed about \$130,000, so it is estimated, but from one cause and another the actual cost will likely be in the neighborhood of \$150,000. They measure over all 225 feet, with a beam of 42 feet. Each will have a hold of 19 feet, will be schooner rigged with five masts, together with modern equipment for handling loads. The auxiliary power equipment will consist of oil-burning engines of the Bolinder type, which are being imported from Sweden. Three sets are already delivered, and it is expected that more will be on hand in time for the completion of other vessels on schedule time.

The Cameron-Genoa Mills Shipbuilders, Ltd., has to date invested about \$50,000 in new plant and material. The Wallace Shipyards, Ltd., who are also building several ships of the above type, have invested about \$35,000 in their enterprise.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data  
and Ideas Evolved from Actual Practical Application and Experience

## METHODS OF MEASUREMENT FOR EXPERT MECHANICS

By F. Scriber.

**W**ITHOUT method a goodly tool may be a poor makeshift—is sound logic for a tool-maker or inspector when taking measurements to insure accuracy. It takes good machines to do good work and it takes good tools to know when the work is correct, but it takes sound reasoning to be sure one is not getting fooled in the measurements as taken. A tool-maker should plan his work and set up his machine with an eye to accuracy first and last, always allowing production to be the effect of interchangeable accuracy, and never permitting speed to induce a questionable set-up.

### Principal Aids to Accuracy

The measuring methods here illustrated are reviews of set-ups which it is hoped will be suggestive and are the

kind of examples which conduce toward certainty in the finished product, the three tools shown in Fig. 1 being three of the big aids used to attain this end, and are, namely, Vernier Caliper, Vernier Height Gauge and Surface Gauge.

It is not always advisable to take measurements on a piece of work in the same manner as the dimensions are given on the drawing, and, in fact, unless the drafting department is in the habit of considering how a piece will be measured it is often de-

easily be overlooked. It will be noticed that the limits in both cases are plus or

FIGURE WITH DIMENSIONS  
GIVEN FROM BOTTOM

A MORE SATISFACTORY WAY OF  
DIMENSIONING THE ABOVE FIXTURE.

FIG. 2. TWO METHODS OF GIVING DIMENSIONS ON  
DRAWINGS.

sirable to deviate to some extent in actual practice. In Fig. 2, at the top is shown a fixture with all dimension reading from the bottom of the fixture, and this is to the hole, all other important dimensions being given from this hole down. As the actual distance from the bottom of fixture to the holes and finished seats is not important, but rather the relation of the holes and seats to each other, the better way of dimensioning is as shown in the lower view. In either case the fixture may be set upon a surface plate and measurements taken from one seat to another or to a plug in the hole.

### Overlapping of Limits

A glance at the limits given on the dimensions in these two views brings up a very interesting point which might

minus .003 in., but where the dimensions are given as in the lower view, this means just what it says, plus or minus .003 in., while if the dimensions are measured as given in the view at top of illustration, the limit of accuracy allowed is actually .006 in., as in measuring to one place the reading might be  $2\frac{1}{2} \pm .003$  or 2.503 in., while in measuring to the other surface the reading might be  $2\frac{1}{8} - .003$  or 2.122 in.; therefore,  $2.503 - 2.122 = .381$  in. as compared to

USUAL METHOD OF DIMENSIONING THREAD.

METHOD OF MEASURING THREAD BY WIRE SYSTEM

COMMON METHOD OF DIMENSIONING DOVETAILS

MEASURING DOVETAILS BY THE USE OF PLUGS

FIG. 3. TWO APPLICATIONS OF COMMON  
PLUG OR WIRE MEASUREMENTS.

$2\frac{1}{2} - 2\frac{1}{8} = .375$  in., and subtracting one from the other  $.381 - .375 = .006$  in. Thus, it follows that dimensions given as shown in the upper view must be held to one-half the limit allowed on dimensions

FIG. 1. THREE OF THE PRINCIPAL INSTRUMENTS USED  
IN MEASURING DIMENSIONS OF MACHINE WORK.

as given in the lower view to obtain the same relative accuracy, and, incidental, the closer the limit the longer the time required for doing the work, and thus it will be noted there is a distinct ad-

FIG. 4. METHOD OF MEASURING A VEE BLOCK, USING A PLUG FOR ACCURACY.

vantage in giving dimensions as shown in the lower view.

Calipering over plugs, buttons, wires and balls is the ideal way of measuring a great many classes of work which have

FIG. 5. LOCATING HOLES BY THE BUTTON METHOD.

angular surfaces. In this class are included the wire system of measuring screw threads on the pitch line and the measurement of dovetail slides, both of these methods being shown by Fig. 3, where the ordinary methods of giving di-

FIG. 6. METHOD OF LOCATING WORK RADIALLY FOR MACHINING ON BORING MILL.

mensions for these parts are shown, and also the method of calipering with plugs or wires.

#### Plugs and Trigonometry

It is sometimes difficult for a beginner to take measurements by the plug system unless the work is dimensioned in

that manner, inasmuch as a knowledge of trigonometry is necessary to change a dimension given across points, to a dimension suitable for plug measuring, but the extra work is well worth the trouble when the resultant accuracy is desired, or when the parts can not be fitted, and reference to the principles involved for these calculations can be had by consulting any up-to-date machinist handbook.

The dimensions necessary for accurately measuring a vee are shown by Fig. 4, where a plug is used, as it is impossible to measure accurately to sharp corners with a scale. In this case the plug is equal to the size of work which rests in the vee; A is the distance from seat which vee rests against to centre of work; B is this distance plus half the diameter of the plug, and the other dimension C is obtained in the same manner by subtracting F from D, while E is the length of block.

Laying out holes by the use of buttons is illustrated by Fig. 5, and the manner of accomplishing this is obvious, as all holes are measured in a horizontal or vertical plane A and B from a central hole, while the radius of the buttons X and Y must be subtracted from the dimension C for measuring between the buttons, this method being preferable to radial and angular measurements for accurate work.

Fig. 6 illustrates an example in setting up a boring mill for cutting the slot A after the other portions were finished, using a plug B in the centre of the face plate and calipering at C, D and E to locate the work while the radius

is measured across F, it being necessary when locating the work to hold a parallel bar, as shown by the dot and dash lines to permit of calipering at right angles to the various surfaces over to the plug.

#### Progressive Height Measurement

A micrometer depth gauge clamped to a straight edge for use in measuring depths where the opening across top of hole is too wide to support the beam of

the depth gauge is shown by Fig. 7, while a height gauge of the vernier type, as shown in Fig. 1, can frequently be used to good advantage for measuring such work as is illustrated at the left of

FIG. 7. EXAMPLE OF MEASURING DEPTHS HAVING A WIDE OPENING.

Fig. 8. On this piece of work it is desired to measure the thickness of each projection X, and this is accomplished by squaring up the work in the vise A in right-hand view, when, by setting the vise on a surface plate B, the distance C is measured, which is followed by measuring the distance D, and likewise all of the other distances from surface plate, when by deducting one from the other the thickness of each projection is obtained. Care should be taken not to disturb the part in the vise until all the desired measurements are made to obtain correct readings in rotation.

Suitable calipers not being available with which to measure the pulley shown in Fig. 9, the diameter was computed by use of the set-up shown. This consisted of placing the work on a milling

FIG. 8. LEFT: WORK TO BE MEASURED. RIGHT: SHOWING USE OF TRY SQUARE AND HEIGHT GAUGE FOR MEASURING WORK.

machine table held between two angle irons A; with an arbor B in the hole of the pulley, when by measuring across C, multiplying this by two and adding the diameter of the arbor, the size of pulley is accurately obtained.

As an incidental feature of measuring, accuracy is often the result of keeping close watch of the method of setting up the work when machining, for, as any first-class mechanic knows, it is

harder to plane or mill a piece square by machining the sides haphazard than by keeping the end of the work always at the same hand of the operator and locating in succession against the side last

FIG. 9. A METHOD USED FOR MEASURING A LARGE PULLEY.

machined. For this reason when machining work which is to be square it is advisable to have a point contact for pinching the rough side of the work similar in principle to that shown by Fig.

FIG. 10. ILLUSTRATION OF PRINCIPLE INVOLVED IN MACHINING WORK SQUARE.

10, which shows the four cuts in the order made, as indicated by the finish marks and a piece of round stock between the sliding vise jaw and the work. This principle of squaring from the proper surfaces should be borne in mind when locating all classes of work for machining or measuring.

FIG. 11. TWO VIEWS OF WORK WHICH IS SET UP AS SHOWN IN FIG. 12.

Milling cutters are often located in relation to the work by means of set blocks, but the mere fact that set blocks are provided for this purpose is no guarantee that the work produced from a set block measurement will be accurate, and the work produced should, therefore, be measured to be sure it is correct. Reasons for this are obvious, as a milling cutter out of truth will not cut correctly, and likewise when setting straddle milling cutters on the arbor, allowance must be made for "tightening the nut" when the cutters are located by means of a set block, as the tightening of the nut forces the cutters closer together and makes them cut small, thus 1.000 in. test with set block may be .995 in. on the part machined.

#### The Use of Construction Holes

Several examples in the use of construction holes to facilitate the measurement of angles are shown by the following sketches, this often being the most convenient way to obtain an accurate angular measurement. Fig. 11, upper view, shows a round disc with two counterbored cuts A and B in it. The difficulty of measuring these counterbored cuts is at once apparent, but by putting in a construction hole A, lower view, Fig. 11, with a pin in it, the work may be set up, as shown in Fig. 12, and counterbored. The measurements may be taken as given at B and C, Figs. 11 and 12,

FIG. 13. EXAMPLE OF MEASURING ANGULAR SURFACE AND LOCATING PIN "A."

using a height gauge to get the difference in height from the table of machine, and as the construction pin is located from face of disc D the work will be correct. The dimensions for locating the other counterbore are E and F. Fig. 11, while the angles are G and H. To locate the work at the proper angle for

counterboring, a plug J may be used, which is set to the dimensions K and L, which are figured by trigonometry to give the desired angle, as will be explained later. It will be noted on this

FIG. 12. METHOD OF SETTING UP THE WORK SHOWN IN FIG. 11.

example that the dimensions are given to centres, although in actual practice the radius of the construction pins must be subtracted from the centre distance, and the measurements taken between the pins or buttons.

Illustration Fig. 13 shows an accurate method of locating the pin A from the seat B, and also shows the method of

FIG. 14. MEASURING AN ECCENTRIC HOLE WITH PLUG.

measuring the seat B from the bottom and the angular surface from the seat by the use of a construction hole, this being a typical milling fixture construction measurement. In this instance the seat B is first machined to dimensions C, D and E, following which the construction hole F is located to the dimensions G and H, from which it is a simple matter to measure the angular surface from the construction hole using angle and dimension J, which likewise the hole for pin A is measured using dimension K and angle.

#### Ascertaining Eccentricity

A simple way of measuring an eccentric hole in relation to a concentric hole is illustrated by Fig. 14. In this set-up an arbor A is placed in the small hole, and the eccentric hole is calipered to get the exact diameter, when by trying test plugs B between the arbor and the hole the amount of eccentricity can be calculated by adding half the diameter of the arbor A to the plug B and subtracting this from half the diameter of the eccentric hole C, the result equaling X.

### MISFITS IN SCREW THREADS

IN a paper on "The Standardization of Screw Threads," presented before the American Railway Master Mechanics' Association, F. O. Wells stated that in searching for the principal reasons of misfits in screw threads it had been found that non-interchangeability was due less to inaccuracy in the screw-cutting tools themselves than to the unreliable methods employed in taking and transferring measurements, and also to the total disregard of proper tolerances for both male and female threads.

In theory, screw-cutting tools should reproduce their own threads; in practice they did not always do so. The principal point to be brought forward was that it was not the tools that had to interchange, but the work done by them. It was generally agreed among tap and die and screw manufacturers that the screw was the basis from which all formulas and calculations should be derived. The usual custom was to tap a hole and fit the screw to the tapped hole, and in the process of making a screw, if the lead of the tap was not normal which had been used to tap the hole, the operator kept cutting down the screw to fit the hole, and consequently got it greatly under size of the tapped hole.

It was a fact that the vast majority of taps broke in use and that very few wore out. Some authorities put the total breakage at 90 per cent. of all the taps used. This breakage was due largely to the fact that the holes to be tapped were not either drilled or reamed to a large enough size. For ordinary work, three-quarter depth of thread was good practice. A nut having only one-half depth of thread would break the bolt before it would strip the threads. The outside diameter had little or nothing to do with the fit for a screw thread as long as the screw was made basic, or smaller, and the tap over basic. If this condition existed, when put into use the metal in the top of such threads flowed and made a fit depending upon the tolerances; the closer the tolerances, the tighter the fit. Pitch diameter and lead were two factors of equal and reciprocal importance.

Tests showed that long, curly chips from taps required less power, and there was consequently less breakage than from taps which made fine, granulated chips. This statement was equally true of dies. To obtain these curly chips it had been found necessary to give these taps and dies a certain amount of positive rake, this rake depending upon the material to be cut. To make the tolerance of screw threads within well-defined limits for railroad work would tend to prevent the nuts and screws from working loose, and no doubt help to decrease the number of accidents that could be prevented by some forethought and care. These limits must be very carefully worked out, because on screw

threads subject to jar, if the fit were too loose, the parts would quickly come apart, while if the fit were too tight the strain set up by the tight fit, together with the jar, would soon carry the part beyond its breaking strength, and so cause a rupture.

### DON'TS FOR LATHE HANDS.

By R. M.

DON'T have a lot of things lying on the saddle.

DON'T use the saddle of the lathe for an anvil.

DON'T leave the chuck wrench in the chuck—something might happen.

DON'T use metal belt fasteners where belts are to be shifted by hand.

DON'T start a new machine unless you are familiar with the mechanism.

DON'T let your lathe centers go too long without redressing. The proper angle is 60 degrees.

DON'T permit the center lubrication to become full of grit. Keep it clean and under cover.

DON'T be continually using belt dressing to increase the driving power. Look elsewhere for the trouble.

DON'T forget that an occasional drop of oil on the tool post screw will increase the holding power on the tool.

DON'T try to pull cuttings from about the work with the hands while the work is in motion. Use a bar or stick.

DON'T slack off the gib screws unless the slide is too tight. The trouble is often too much dirt and insufficient lubrication.

DON'T have any excess overhang on the cutting tools. The closer the working point is to the center of support, the better the results.

DON'T allow grease and dirt to accumulate on the sides of the cone pulleys. The belt will have a tendency to climb to the next step.

DON'T place a center or drill socket in the lathe spindles unless you are sure they are both free from dirt and other objectionable features.

DON'T put too much oil on the feed screws that are open to the cuttings from the work. Excess of lubrication in this respect may prove as expensive as too little.

DON'T forget that heat will be generated when turning small shafts, causing the work to elongate. The tail stock center may require to be gradually released to avoid distortion in the the shaft.

### CANADA'S TRADE FOR PAST YEAR

DETAILED figures of exports and imports for the twelve months ended with last June, as published by the Trade and

Commerce Department, shows some interesting developments of trade conditions during the two years of war.

Exports to Britain have nearly trebled, while imports from Great Britain have fallen off by over 25 per cent. For the twelve months ended June last, Canada's exports to Britain totalled \$557,909,000, as compared with \$209,609,000 for the twelve months ended June, 1914. Imports from Great Britain were \$90,275,000, as compared with \$121,461,000 two years ago. Canada's favorable balance of trade with the mother country for the twelve months ending last June was \$476,647,000.

Trade with the United States shows an increase of nearly \$74,000,000 in imports and of \$117,865,000 in exports during the two years. Imports increased from \$363,117,000 in 1914 to \$442,088,000 in 1916. Exports increased from \$182,575,000 to \$300,440,000. The balance of trade for the twelve months ended with June last was in favor of the United States by \$141,648,000.

Canada is now buying \$74,000,000 worth of goods a year more from the United States and \$31,000,000 worth of goods less from Great Britain than was the case two years ago.

The rise in the price of foodstuffs, meats, etc., is explained to some extent by the fact that Canada found it necessary to import during the twelve months ended with last June, provisions costing \$15,561,000, breadstuffs costing \$10,938,000 and vegetables costing \$2,549,000, a total of \$30,000,000 worth, on all of which the consumer had to pay a substantial duty.

The increase in the importation of provisions for the twelve months was nearly \$10,000,000 as compared with the preceding twelve months.

On the other hand, exports of cattle increased from \$8,702,000 to \$12,505,000 of breadstuffs from \$123,851,000 to \$304,388,000 and of provisions from \$49,388,000 to \$73,210,000. Exports of cheese for the twelve months ended with last June totalled \$27,731,000, a \$6,000,000 increase, and of bacon and hams, \$31,082,000 a \$14,000,000 increase.

The growth of temperance is probably reflected in the increased consumption of tea and coffee. For the twelve months ended with June, Canada bought tea to the value of \$8,557,000 and coffee to the value of \$2,033,000. There are increases of \$1,133,000 in tea and \$379,000 in coffee as compared with the preceding twelve months.

On the other hand, the importation of spirits and wines decreased from \$4,563,000 in 1915 to \$3,992,000 in 1916.

The percentage of duty collected on taxable imports has increased from 26 per cent. in 1914 to 34 per cent. at the present time.

# The Development of Irregular Sheet Metal Pipe Connections

Staff Article

*The problems dealt with in this article are typical examples encountered in actual practice, which, while not of very frequent occurrence, may be of considerable importance when met with. They possess considerable divergence from ordinary symmetrical forms and a study of the methods employed will enable their application to be successfully carried out in similar cases.*

A SHEET metal problem, involving some interesting projections and developments, is illustrated and described in the accompanying article. In Fig. 1 are shown four views of the piece required—(a) front elevation; (b) side elevation from the left; (c) side elevation from the right; and (d) top view. The diameter of the lower vertical section F is to be 2 feet, and also the branch A; the branch B is 18 in. in diameter, the centre line of both branches making an angle of 45 degrees with the centre line xy, and intersecting in a common point, as shown at O.

## Drawing the Front Elevation

To draw the several views in Fig. 1, first erect the vertical line xy and the base line ab. From the point 4, mark off the distance 4, 0, equal to 2 feet, and from the point O draw the centre lines of the branch pipes at an angle of 45 degrees. At a distance of 4 feet from the base line draw the horizontal line 1' 1', showing the top of the transition piece D; also a line 6 inches higher upon which the extreme points of the branches A and B lie. On either side and parallel to the centre line of each branch draw the lines 1, 1' and 7, 7' at a distance equal to the radii of the pipes. Draw the lines 1, 7 at right angle to the centre lines, and in such a position that the point 1 falls on the extreme top line. Then from the point 4 describe the semicircles into six equal parts, projecting the points parallel to their respective centre lines, and dividing the sections A, B and F as shown. Lay off the line

4' 7' in A so that the two angles (i) and (i) are equal, also the line 1' 7' in F, so that the angles (j) and (j) are equal. This makes the piece C a portion of a

taken to have similar points in the various views numbered alike. On the centre lines of both side views at a convenient point describe semicircles equal to the

FIG. 1.

round pipe with a diameter equal to that of A and F.

From the point 1' at B, drop a vertical line, cutting the centre line O, 4 at 4, and from this point draw a line at right angle to the centre line. Connect the points 4' 4' and 7' 7', thus forming the piece E.

## Top and Side Elevations

The two side elevations, and also the top view, can be obtained by the ordinary method of projection, care being

diameter of the corresponding pipes, and divide each into a certain number of equal parts, generally twelve divisions to a circle. The vertical projections for the side elevations are obtained from these circles, and the horizontal intersections are obtained from corresponding divisions on the front elevation. The top view is obtained in a similar manner, the horizontal projections being obtained from the construction circles, and the vertical intersections obtained from corresponding points on the front elevation; the ellipses representing the several openings and joints being drawn through the various intersections.

## Developing Cylindrical Sections

The developments of the three cylindrical pieces, A, B and F, are shown in Fig. 2. The elevation of the three pieces are shown on the right. A semicircle is described on the base line and divided into six equal divisions; the projection of these points cutting the base and angular faces in the points shown. On the base line of the development twelve divisions are marked off, each equal to one-twelfth of the circumference of the pipe, and numbered with the correspond-

FIG. 2.

ing points in the elevation, the line 1, 1' representing the seam in each piece. Vertical lines are erected from each division on the base line, the intersection for the irregular curve being obtained from the horizontal projection of the corresponding points in the elevation. In developing these surfaces, no allowance has been made for seams—sufficient metal must,

at these points equal in length to the lines 3, 3'—4, 4'—5, 5', etc., in the semi-circles at either end of the pipe connections. The length of the lines 2, 3'—3' 4', etc., in (h) will be the true length of corresponding lines in the elevation. As each half of the pattern is symmetrical, it can be developed on either side of a centre line.

FIG. 3.

therefore be added where necessary, depending upon the style of joint used.

#### Transition Development

The development of the three transition pieces, C, D and E, is shown in Fig. 3. The piece C is developed similarly to those shown in Fig. 2. The centre line  $xy$  is drawn at right angle to the line 1, 2 in the elevation, and on this line six equal divisions are marked off, each equal to one-twelfth of the circumference of a 2-foot pipe. From these points on the centre line  $xy$  perpendicular lines are drawn, and the intersections of these lines with projections from the section C in the elevation are the points on the irregular curve.

The developed shape of the transition piece E is shown to the right of the elevation. To obtain the true length of the various radial and diagonal lines the triangulation method is used. The line 1, 2 being on the centre line of the side view, is, therefore, the true length in the front elevation, so with this as a basis we can proceed to obtain the true lengths of the other construction lines. On the base line at (h) lay off the various lengths, 1, 2—2, 3—3, 4, etc., as shown on E in the elevation, and erect perpendiculars

At right angle to the centre line  $xy$  erect the line 1' 2', equal in length to the line 1, 2 in the elevation. With 2' as centre and 2, 3' in (h) as radius, describe an arc that intersects at 3' with one drawn from the point 1', with a radius equal to one-twelfth of the circumference of an 18-inch circle. Then with 3' as centre and 3' 4' in (h) as radius describe an arc that intersects at 4' with one drawn from the point 2', having a radius equal to the distance 6' 7' on the curved line in F, Fig. 2. The development of E can be completed by following the method just described, noting carefully the corresponding figures and lines; the length of the line 8' 8' in E will be of the same length as the curved line in F, as contained between the points 4' 4'.

The development of the transition piece D is shown at the top of Fig. 3, and is derived similar to that of E. The end portions that connect the two branch pieces, A and B, are divided by projecting lines from the semi-circles as shown, the points 1, 2, 3, etc., forming the extremities of the radial and diagonal construction lines. The true shape of the ends are shown at (e) and (f), obtained in like manner to that described in Fig. 1. The true length of the construction

lines in the elevation are shown by the cross lines in (g) Fig. 3, and are obtained the same way as in (h). On the centre line  $xy$  of the pattern D lay off the distance 1' 2' equal to the line 1, 2 in elevation, and with 2' as centre and the length 2, 3' in (g) as radius, describe an arc that will intersect one drawn from the point 1', having the length 1' 3' in (f) as radius. Then with 3' as centre and 3' 4' in (g) as radius, describe an arc that will cut another arc drawn from the point 2', having the length 2' 4' in (e) as radius. Proceed in this manner until the line 7' 8' has been obtained, taking care that the curved line 7' 7' in the pattern is the same length as that in (f), and the line 8' 8' the same as the curved line in (e). Now with 8' as centre and the distance 7, 8' in (c) as radius, describe an arc at the apex 0', and from the point 7', with the line 7' 8' in (h) as radius, describe an arc cutting the other at the point 0'. Then lines drawn from the point 0' at either end to the points 7' and 8' will complete the development of the transition piece D.

#### GRINDING LATHE AND PLANER TOOLS.

THE desirability of having the grinding of tools done by one man is being more widely recognized, but it is not always feasible to have it done. After having read Fred W. Taylor's truly remarkable treatise "On the Art of Cutting Metals," and having had several interesting interviews with modern mechanics, a writer in Grits and Grinds states that at least two things made a strong impression on his mind in connection with the grinding of high-speed lathe and planer tools:

a. They are ground successfully both by the free hand method and by automatic tool grinding machines.

b. It is common practice to grind both wet and dry.

Taking up first hand vs. machine method—the machine method of grinding is safer and more satisfactory except in instances where there are real mechanics who possess both mechanical horse sense and skill.

The advantages of hand grinding are: It gives the operator a little better opportunity to regulate the angle or rake to suit the work. Since he must grind the tool many times each day he should be able, if a good, observing mechanic, to improve the cutting edge with each grinding. This remark was recently made by a man who is interested in keeping up the efficiency of the shop: "There is just about one man in ten who grind tools in this shop who can grind a lathe tool better by hand than a machine will grind it and it is mighty

poor policy to let any green man grind by hand."

The parties whose interests are on the side of the automatic tool grinding machine have good arguments why machines should be used exclusively. Saving of workmen's time, saving of time lathes and planers would stand idle while tools are being ground, the correct grinding angles, life of the tool, quality of work, increased production and a smaller investment in high speed steels are some of the talking points.

#### Wet vs. Dry.

Whether to grind high-speed steel wet or dry is still being debated, and it is being ground successfully by both methods—take your choice. The most approved practice, in so far as the writer can learn, is to grind wet whenever practicable. Reference to the printed instructions issued by four of the principal high speed steel makers disclosed the fact that two of them instruct the users of their product to "grind on a wet wheel" and two to "grind on a dry wheel."

When grinding wet a copious stream of water must flow at low velocity directly on the nose of the tool. It should be ample to take up the heat as fast as it is generated. A little water is far worse than no water at all as it is the direct cause, many times, of surface cracks and checking. When grinding wet do not grind too forcibly as the water is thus temporarily kept away from the surface being ground, and when the tool is released the cold water strikes the hot surface causing it to check and surface crack.

It is not unusual to find tool grinding machines in use that are not properly provided with a sufficient water supply and there are cases, too, where the workmen grind without turning on the flow of water full force because it is somewhat disagreeable to grind a small tool by hand under these conditions. Both are costly; high-speed steel is too expensive to be thus damaged.

The advocates of dry grinding contend that "high-speed cannot be damaged by dry grinding" and that the green man will have less trouble by the dry method. The superintendent of a shop where both wet and dry methods are used for lathe and planer tools, remarked: "There is one advantage in grinding dry, particularly short tools—the grinder can't force the grinding too hard; if he does he'll burn his fingers."

There is a temptation when grinding dry to plunge the hot tool in a bucket of water to cool it off. This is considered by many poor practice.

#### Lip and Clearance Angles of Tools

Taylor says:

"For standard shop tools to be

ground by a trained grinder or an automatic grinding machine a clearance angle of six degrees should be used for all classes of roughing work."

"In shops in which each machinist grinds his own tools a clearance angle of from 9 degrees to 12 degrees should be used, because in nine cases out of ten the workmen grind the clearance and lip angles of their tools without any gauges, merely by looking at the tool and guessing at the proper angles. Much less harm will be done by grinding clearance angles considerably larger than six degrees than by getting them considerably smaller."

"Tools for cutting cast iron and the harder steels, beginning with a low limit of hardness, of about carbon 0.45 per cent. should be ground with a clearance angle of six degrees, back slope eight degrees, and side slope 14 degrees, giving a lip angle of 68 degrees."

"For cutting steel softer than carbon 0.45 per cent. clearance angle six degrees, back slope of eight degrees, side slope of 22 degrees, giving a lip angle of 61 degrees."

"Chilled Iron—a lip angle of from 86 degrees to 90 degrees should be used."

"Steel as hard or harder than tire steel; clearance angle six degrees, back slope five degrees, side slope nine degrees, lip angle 74 degrees."

"Extremely soft steels, carbon 0.10 per cent. to 0.15 per cent. use tools with lip angles sharper than 61 degrees."

"Tools ground with lip angle of about 54 degrees cut softer qualities of steel and also cast iron, with the least pressure of the chip upon the tool."

#### Tools for Special Holders.

Many shops are now equipped with special tool holders which permit the use of small bits of high-speed steel instead of solid forged tools. The grinding of these tools for special holders is a somewhat different proposition from the grinding of solid forged tools due to the fact that the holder socket may be inclined at an angle to the lathe centres. It is necessary when such is the case to add the desired amount of clearance to the fixed angle of the holder socket. For example, if six degrees of clearance is wanted for the tool when at work and the holder socket is inclined at an angle of say 16 degrees the tools should be ground at an angle of 22 degrees. This is a point frequently overlooked, except when the tool grinding machine is provided with a special holder for grinding them or when the bits are ground in the holders.

#### Lathe Chips.

The lathe man is usually interested in the shape of lathe chips he is getting. He considers a long, stringy ribbon chip a dangerous kind because it is likely

to wind up around the work and to swing around and slap him in the face. A common trick of the old-time mechanic, in order to guard against the dangerous chip, is to grind a little groove across the top of the tool a short distance back from the cutting edge—say about  $\frac{1}{8}$  in. to  $\frac{1}{4}$  in.. The groove should not be too deep. This has a tendency to break up the chip in short pieces or roll it in a coil which is easily taken care of. The kind of chip referred to above is more likely to be found when working soft and tough steels. Hard, brittle steels break more easily. Cast iron does not give trouble in this respect as the material does not hold together

#### Some Good Points to Remember.

The surface of the tool should never be allowed to fit closely against the surface of the grinding wheel for any great length of time. Keep moving or wobbling the tool about while grinding.

Practical machinists who grind their tools incline towards too little rather than too much side slope. Steep side slope is avoided for reasons of economy.

It is economical to have on hand a sufficient supply of tools that the dull tools may be laid aside to be ground in lots or batches. It is also probably economical for even the small shop by such a system to use an automatic tool grinding machine.

There is greater economy in the automatic tool grinding machine where standard shapes for all tools have been adopted.

It is a common practice among workmen to use the side of a grinding wheel to finish grind. It should always be kept in mind that the side of a straight wheel was never intended to be ground on and the man who uses the side is not observing the "safety first" rules. There may be some cases where even a slightly concave edge on the tool would be objectionable, but it is doubtful if there is enough concavity when the average grinding wheel is used to make any difference in the action of the tool. Should it be so, the remedy is to grind on the rim of a cup or cylinder wheel.

Should special men be delegated to do all the grinding of cutting tools and be provided with suitable templates and gauges

"Yes," a superintendent replied, "but we don't do it here, and I don't think there are many shops where the plan is entirely practical. We have five or six lathe and planer departments and no one of them is large enough to support an automatic grinding machine. They are too far apart for a common grinding department. That would be an ideal plan if the conditions were ideal, but they're usually not."

## "SAFETY FIRST"—LOCATING MACHINE TOOLS

by R. Hamilton

**T**HERE is an old saying that "Prevention is better than cure." This proverb is not only true in the physical sense of its meaning, but it can also be applied to good purpose in the routine of every-day work.

### Twofold Influence

Among the various developments due to efforts to provide better protection for all classes of workmen, the placing of machinery is one of increasing importance, not only in direct relation to the men as individuals, but in its influence on the results obtained through other precautions whether practical, such as protective apparatus and devices, or moral, consisting of instructions, warnings, etc. When equipping a new shop for the manufacture of a certain product, the layout of the machine

sary amount of material is often allowed to accumulate.

The free movement of the workmen in the discharge of their duties, should be one of the chief considerations of the executive, as the efficiency of a plant depends largely upon the elimination of unproductive action on the part of the employees.

### Dangerous Thoughtlessness

Many machines are located in such a position that the precautions required in their operation result in considerable loss of time, and occasionally in injury to the workmen. While in a shop some time ago the writer noticed a power hack saw placed alongside of a 16 in. shaper, the ram of which travelled back to the wall, when on the full length of stroke. To place a short bar in the hack saw vise, it was necessary for an operator to crowd in at the rear of the shaper to support the end of the bar. While no accidents have actually happened, there has been several narrow escapes of heads and arms being crushed, owing to the shaper hand starting up his machine while a bar was being placed in the saw.

### Gap Lathe Location

The location of a gap lathe is connection with the safety of workmen, other than the operator—should be given careful consideration, as the possibilities of accident are often overlooked. Plenty of room should be provided, both at the front and rear of the machine, and a suitable guard placed, if necessary, to prevent passing workmen coming within the danger zone. In some plants the use of a gap lathe is seldom required, and when used is mostly for circular work; but when this tool is operating on odd-shaped pieces, such as bell cranks, connecting rods, etc., the possibilities of accident from projecting portions is often very great.

Some time ago in a certain shop known to the writer a job was being performed in a large gap lathe, which necessitated an arm of the work extending for a foot out from the rim of the face plate. The rear of the gap lathe was located about three feet from the working side of a small engine

lathe. While the workman on the smaller machine was taking a step backward, to remove a piece of work from his lathe, the large lathe was suddenly started, the swinging piece striking the

LATHES TOO CLOSE TOGETHER.

workman a violent blow upon the arm, that resulted in a lay off for several days. Another objectionable feature in connection with these two machines was that the operator on the smaller one had to stop his work and stand to one side while heavy work was being hoisted into the larger lathe.

### Obstructing Thoroughfares

Another common cause of accident is the placing of hollow spindle lathes and turret machines, in such a position that the work often extends partly, or entirely, across an aisle or section of a shop where there is considerable traffic. If it is a general practice to operate on long bars, the workmen get the habit of using another passage, but if only occasionally used, the chances are that a workman may receive injury before he can be warned.

Over a year ago an accident occurred in a certain shop, where his coat was torn from the back of one of the workmen. A bar was extending part way

STOCK PROJECTING OVER PASSAGEWAY.

across a passageway that was much used when one of them—a new man—in passing the end of the lathe, came in contact with the revolving bar, and before he could retreat, the end became twisted in his clothing with the result above

SHAPER TOO CLOSE TO WALL.

tools can be so arranged as to obtain the highest possible efficiency, both in production and economy, but, when it is necessary to install additional machinery in a shop already equipped, it often becomes a problem just where to locate the extra tools.

The proper placing of machine tools, especially when the equipment is being added to, is very essential not only with regard to its productive efficiency, but also as regards the safety of the employees, operating the various tools.

### A Common Cause

One of the great sources of accidents in metal working shops, is the frequent over-crowded condition of the plant: not only in the quantity of the heavier tools, but in the general condition of the space between the machines, and the main aisles of the shop, in which an unneces-

Many other cases might be cited where more or less injury and near accidents have resulted from machines being located in positions that have necessitated the workmen taking risks which would otherwise have been avoided if proper consideration had been given to the placing of machine tools. If, after a machine has been placed in a certain position, it is found that an additional hazard has developed, the danger should be immediately minimised, if not entirely eliminated by the provision of such guards as it is possible to install.

## MACHINISTS' INSTRUCTION COURSE—VII.

IN order to turn a parallel bar between the lathe centers it is necessary for the lathe centers to be in line with each other and with the line of movement of the tool rest. To test this, use a bar about 2 ft. long with a small portion at each end turned to the same size or slightly less in the middle for clearance, set the tool to just touch one end of the bar, then run the carriage along to the other end and if the tool does not touch at the other end move the tailstock whichever way it needs to go, until the tool exactly touches either end of the bar. If the end of the tailstock is not already marked make a reference mark with a fine chisel, so that it can be put back to the same place if you need to move it at any time.

If you have no test bar or no time or opportunity to make one, try out the centers by using the job in hand. Turn a small portion at each end to the same size, then, instead of undercutting the middle for clearance, set the tool to touch the turned portion at the live center end, take the job out of the centers, or if it is a light job turn back the tailstock center enough to allow you to run the carriage to the other end against the centers and test as before. If the job is too heavy to conveniently take out of the lathe, note the graduations on the cross feed screw or make a reference mark on same and see that the tool just touches each end of the turned portion when the reference mark on cross feed screw is the same. Another result of the centers not being in line can be seen by facing the end of the work between the centers, when, by placing a straight edge across the end, it would be found that the end would be concave or convex, according to which way the tailstock needed to be moved, as the centers have to be exactly at right angles to the cross slide to produce a flat surface.

### Selecting a Tool

Volumes have been written about the theory of cutting tools, but to specify

the exact size and shape of all the different lathe tools is outside the scope of these articles. The shape of the tool depends entirely upon the nature of the job and the kind of metal to be cut. Generally speaking, the softer the metal to be cut the sharper the tool, while with hard metal there is less clearance. If it is a light spongy job, the tool ought to have a comparatively narrow nose with lots of side clearance so that the cuttings will slide off with the least possible resistance. Cast iron can be cut with a broader nosed tool than wrought iron or steel, because the chips break off more readily and thus relieve the tool, allowing a broader nose and rougher feed.

### Height of Tool

It is important to have the tool at the right height, so in order to insure this make a mark on the tailstock spindle exactly the height of the lathe center, put a parting or cutting off tool in the tool post and adjust it to the exact

FIG. 30.

height of the lathe centers. Now slightly press it against the tail stock spindle and run the carriage along making a permanent mark on the tailstock spindle about 2 inches long, Fig. 30. This will be found very convenient especially when setting the tool for taper work as will be shown later.

Set the tool a little above the center; by using the reference mark on the tail stock spindle, you will know exactly the height of the tool in relation to the lathe centers. The larger the diameter of the work the higher you can set the tool above the lathe centers with advantage. Avoid setting the tool below the center, because if there is any lost motion in the screw or slackness in the slide, the tendency is to pull the tool into the work, when without warning, the job will climb over the top of the tool and jump out of the centers. Fasten the tool in the tool post as close to the cutting edge as possible and keep it quite clear of the work while doing so.

### The First Cut

Making the first cut is entirely a mat-

ter of judgment. Try the calipers on it as soon as you can but be careful not to take too much off at the first trial as there are no lathe putting-on tools. After adjusting the cut to the right size start the feed and let it run half way up the bar, then remove the work, run the tool back to the starting point, replace the work in the reverse position, and let the same cut run over the part that has not been turned. The work will now be the same size at both ends and the cut will meet in the center. If the live center should not run perfectly true, it will be least noticeable where the cuts meet in the middle of the bar.

If it is necessary to take a number of cuts and a very accurate job is wanted, it is best to reverse the work at every cut so that the centers will wear even. Before clamping the dog on to a finished surface, place a piece of sheet brass about the size of a postage stamp under the set screw to save marking the surface.

Always grind the tool before taking the finishing cut. Finishing tools, as a rule, will stand a little more rake on top than roughing tools. Take the finishing cuts with a fine feed and at as high a speed as the tool will stand up to, considering the diameter and length of the job being done.

### Measuring With Calipers

A good lathe hand can with care detect a difference of .001 inch with an ordinary pair of spring calipers. They should be held lightly between the thumb and fingers of the right hand, while the thumb and forefinger of the left hand hold one of the caliper points stationary on the piece to be calipered. Gently swing the other point across the work, and move it in and out until you find the place where the point has the least travel. This is the smallest diameter that can be found, and is at right angles to the axis of the shaft. When this point is determined, let the calipers pass over with a very slight pressure; some prefer to let the calipers pass over without touching, noting very carefully the amount of side play or travel of the calipers at the smallest part and then have the same conditions exactly on the plug or piece that they are measuring from. This is probably the most accurate way, but it requires some experience as it depends more upon judgment than sense of touch.

### Turning to Gauges

If the shaft has to be turned to fit a ring gauge it must of necessity be a few thousandths less than the ring gauge, depending upon the diameter, as a ring gauge of 3 in. diam. for instance will not pass over a 3 in. plug although sometimes plug and ring gauges are made

to pass over each other especially home made ones.

When using plug and ring gauges remember that the kind of fit that the ring and plug gauge make with each other is exactly reversed in the work. If the plug and ring gauge will not go together, the work made to them must. If the ring and plug will pass over each other the work may not, as it would depend on whether the work was a closer fit than the plug and ring gauges are to each other. These conditions apply when the hole in the work is made to fit the plug, and the shaft turned to fit the ring, so that if plug and ring gauges were being made for parts that were wanted to be a forced or driving fit, it would be necessary to make the gauges so many thousandths slack.

### MANUAL POWER

By A. L. Haas.

WHEN labor is extremely cheap, as in most Asiatic countries, ordinary sources of power and labor-saving devices of the West are from this cause relatively dear and the more primitive human muscle continues in use as the chief source of energy.

At home a metal turning lathe seems inseparable from overhead shafting. In India, China and elsewhere, native labor being abundant and cheap, lathes up to 10-in. centres of modern type, with flared heads, are propelled by treadle. Occasionally the treadmill device of a heavy flywheel separately mounted and operated by four to eight men is used. Recently an engine lathe so fitted came under the writer's notice, 9 in. centres, 10 ft. bed, destined for the Far East.

In the absence of other motive power, or by reason of economy, such method of propulsion of a modern tool, while quaint, may be desirable. Where labor is cheap, time of small consequence with depth of cut, feed and speed proportioned to muscle rather than conditioned by scientific practice, more work of this character is done than is generally realized in more civilized places.

For repair purposes, as apart from manufacture, the gear to accomplish the desired end is of greater moment than any attempt to utilize high speed steel to its ultimate capacity.

It seems likely that at least 30 per cent. of the regular type engine lathes are used for isolated repair plants, and not for manufacture at all. Only on this supposition can the yearly demand and output be explained in normal times.

### A Primitive Lathe

The most primitive type of lathe with which the writer is acquainted, possibly its original form, survives in parts of the Nearer East termed the Levant. Among the trophies brought home by the tourist

to Egypt are articles made up of a multiplicity of small pieces of turned wood.

The operator whose limited kit, including his "lathe" is carried on his person, squats in some convenient corner. He thrusts two pieces of wood, having metal centres, into the ground at his feet. A bow with a loose string is his motive power, and with a supply of material he is ready for a start. The bow is placed one turn round the work between the centres. A chisel held between the toes for rest forms the cutting tool. The bow is moved ceaselessly backwards and forwards with the left hand, the right and the toes (which never having been shod are very flexible) manipulate the chisel. The device is at least as old as the traditional potter's wheel, and antedates the pole spring lathe common enough a century ago. Quite complex shapes, necessarily small, are made with great dexterity and speed.

### A Modern Tinker

A man known to the writer has contrived to effect a living by various devices in many primitive lands. One experience of his concerns his life in Paraguay thirty years ago.

In some unexplained manner he found a derelict lathe for sale at a nominal figure in a coast town; it was 6 in. screw-cutting, with reasonably full kit, and is yet in existence, as he brought it home subsequently. To it he added a portable forge and some miscellaneous gear. Hiring a wagon and horse, he set out in the manner of the country tinker, immortalized by Bunyan seeking work.

The wagon journeyed by devious ways from hacienda to hacienda, and the jobs he managed to accomplish were many. He quoted a price for any work or repair within his capacity, until he left the gear at the ranch in good shape, travelling on again in quest of work and adventure. Sometimes he stayed a week, sometimes a month; very rarely was he refused work. In fact, he makes out that he had a sort of royal progress from place to place. There was no dearth of labor miners' skill, and the treadle of the lathe was never propelled by his own foot. Subject to any scruples he had, his prices were never subjected to question, and the need for his services was evident. Agricultural machines laid aside for some defect he was able to put into commission again. The facilities for purchasing new machines were abundant, opportunity for skilled repairs absent. Hence my enterprising friend obtained a warm welcome and achieved a most competent by the supply of a veritable lack in a sparsely settled community.

The future of the travelling workshop and a record of its adventures would make an entertaining volume if these were adequately rendered into print.

### Price Depends on Place

Skill of the right sort at the right place, where this is isolated, commands a ready welcome and high pay. In Brazil only a couple of years ago an erector of aerial ropeways was paid £50 to travel free of cost a matter of 100 miles to lay up an 80-ft. splice in another ropeway. It was just the exercise of unusual skill in an isolated spot, the fee was paid, as it was cheaper than to bring a man from the coast to do the job.

Another instance of manual labor or power occurs in places of detention and punishment, in prisons where work is done neither for pay nor affection, but as forced exercise.

In a large institution of the kind it is difficult in Asiatic countries to devise tasks of a utilitarian character. To instal power in view of the overplus of labor would be superfluous. So that corn is ground and water pumped by the application of human muscle.

The favorite device for water supply is a three-throw well pump actuated by a capstan. Such a device may utilize up to 50 men for a couple of hours per day.

### Curing a Defect

In connection with a large capstan of the kind for 48 men, the designer who had experience with much smaller capstans provided 10 feet bars, 16 in number. He provided the bars of a size in his judgment sufficient, and these could not be increased in size without a larger head. With only two men at the end of a bar it both sagged and bent considerably, in spite of its initial upward rake. The amount of safe deflection possible at the end of a well-supported ash pole, 10 feet long, must be seen to be believed. The capstan erected for test proved unsatisfactory for this reason.

To remedy the defect in the cheapest manner, the bars were trussed as follows.—A piece of flanged C.I. pipe was bolted flange down on capstan head. This had 7/8-in. holes in the same radial position as the bars at the upper end of the short pipe; 3/4-inch rods, double nutted at the pipe end, were led to clips at mid-section of the capstan bars. These clips were connected bar to bar radially by 3/4-inch double-eye links.

The completed job was quite sightly, the entire capstan now moving like a cart wheel with projecting spokes.

It may be added that the bars (as is usual in such case) were bolted in capstan head. Accidents resulting in serious injury having been known owing to accidental unshipping of a bar while under way. The permanence afforded by the trussing was in this wise not detrimental to the finished job.

Ottawa, Ont.—The Haynes Motor Co. may establish a plant here at a cost of approximately \$40,000.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## SMALL COLD METAL SAWING MACHINE

**T**HE cold metal sawing machine illustrated herewith has been designed to meet the demand for a machine to handle solid bars in individual sizes up to 5½ in. dia. and smaller stock that can be grouped into an equivalent section. Ordinarily it is equipped with a 20 in. dia. high speed steel blade of either the solid or inserted teeth type to enable the maximum capacity of the machine

base. Pump, piping and attachments are supplied to deliver the lubricant to the point of cutting.

A departure from accepted practice in the design is the inclusion of a gear feed, experience having demonstrated that a friction feed that is powerful enough to advance the blade will cause as many breaks, if any, as gear feed. The machine illustrated has been successfully demonstrated to cut off 6 in. .50 carbon stock in three minutes, or at a feed of 2 in. per minute, the equipment when

and thus assist in maintaining the rigidity of the spindle.

The headstock is cast solid with the bed, eliminating the possibility of the spindle working out of alignment. The cut-off is large and well proportioned, with broad, well gibbed bearings, insuring firmness of the tools under heavy cuts. The hand wheel for adjusting the position of the cut-off is provided with a large diameter dial with adjustable clips, so that the different shoulder lengths can be accurately duplicated. The turret slide and saddle unit is provided with a supplementary base and taper gibs for vertical and horizontal adjustment.

The slide is operated by turnstile and rack and pinion, and the turret is automatically indexed by the backward movement of the slide. It is held firmly in its seat by a large steel stud upon which it revolves. This stud is tapered and provides adjustment for taking up wear and is so bored that long stock can pass through the turret, thus permitting the use of short, stiff tools. The lock bolt is of large diameter and is a special grade alloy steel, hardened, ground and lapped. It operates vertically, locking into hardened and ground steel turret bushings, and is provided with a taper end working into a taper hole in the bushings so that the turret is locked firmly in position. This locking position is at the front end of the slide, almost directly under the tool. The holes in the solid hexagon turret are 1¼ in. diameter with binder bushings for holding straight shank tools, and each face of the turret has four ¾ in. tapped holes for bolting tools direct to the turret.

The tool holes in the turret are bored in the machine itself after assembling, to insure that the holes line up with the spindle. Six stops are provided, one for each face of the turret, and when set they operate automatically for each position of the turret. They are threaded for their full length and each one is provided with a binder for clamping it into position when set.

The spindle is a high carbon steel forging, carefully ground to size. Bearings are die cast from a special composition of high grade babbitt. All bearings are carefully scraped by hand for fit and to insure correct alignment of spindle. They are of very liberal dimensions to enable them to stand up under the most severe duty. Sight feed oilers are provided for lubricating spindle bearings. The spindle nose is of large diameter, threaded and provided with pilot end,

GEAR FEED 20 IN. COLD METAL SAWING MACHINE.

to be maintained. Every possible precaution has been taken to prevent the occurrence of chatter.

The machine is of the spindle driven type with spindle revolving in capped bearings and driven by spur gears through worm and worm wheel, the worm wheel being of solid bronze, and the worm fitted with roller thrust bearings. A very essential feature is the front bearing for the feed screw, which insures its operating tension.

The saddle has underlocking gibs cast solid with vertical and horizontal adjustments made by taper shoes and fast power return for the saddle is provided in addition to a gear box giving changes without removal of gears. The saddle is also fitted with trips to stop the feed at any pre-determined point, and safety stops are provided for each of the extreme positions of travel.

Generous oil pans, cast solid with the base, are also provided, and the lubricant is located in the rear inside the

fitted with high speed blades being guaranteed to cut in its average capacity a feed of 1 in. per minute.

This machine is a recent product of the Newton Machine Tool Works, Inc., Philadelphia, Pa.

## 1 IN. x 7 IN. TURRET HAND SCREW MACHINE

THE 1 in. by 7 in. turret hand screw machine shown in the accompanying illustration, is now being placed on the market by the Stenotype Co., Indianapolis, after being successfully tried out in the hands of several purchasers.

As shown in the illustration, this machine is fitted with a plain three-step cone of large diameter and face, giving great power for all spindle speeds. It will be noticed also that a guard is provided for the cone in the form of a well entirely covering the lower half of the cone. This also serves to tie the front and rear bearings rigidly together

and is so constructed that the overhang for either bar chuck or casting chuck is reduced to a minimum. Adjusting collars with hardened and ground thrust washers are provided for taking up end thrust.

The automatic chuck and bar feed, operated by the long lever at the left of the machine, grips the bar instantly and releases it completely. One movement by the operator serves to open the chuck and feed the bar without stopping the machine. A stepped wedge, operating the fingers automatically, compensates for slightly varying diameter of stock. Collets can be changed quickly by unscrewing collet hood. Collets and collet hood are hardened and then ground, to insure great accuracy. Chucks or fixtures for extra size pieces can readily be attached to spindle nose in place of collet hood.

The oil pan is of pressed steel, avoiding entirely the possibility of breakage. The oil reservoir is of cast iron bolted to the pan and is provided with a strain-

1 IN. BY 7 IN. TURRET HAND SCREW MACHINE.

er to prevent chips from entering. The screw plug in the bottom of the pan provides for draining oil and for the removal of sediment. The oil pump is driven by a separate belt directly from a pulley on countershaft and operates equally well in either direction. It delivers an ample supply of oil, distributed by means of an adjustable pipe. A partition in the reservoir prevents the possibility of sediment entering the pump.

All parts are made from jigs and fixtures and are carefully inspected and gauged before assembling, thus insuring interchangeability, and giving a machine which can be relied upon to do close, accurate work.

The principal dimensions of this machine are: Bar stock capacity through automatic chuck, 1 in.; swing over bed, 13½ in.; swing over cut-off, 6 in.; cut-off travel, cross, 5½ in.; longitudinal, 9 in.; holes in turret, 1¼ in. dia.; hole in spindle 19-32 in.; width of belt, 2¾ in.; net weight, 1,375 lbs.

### NOVEL ELECTRIC WELDER

THE electrical welding of pulley fillers to the rims is now being done in a specially built machine which automatically

ELECTRIC WELDER FOR STEEL PULLEYS.

performs the necessary operations on circular work ranging from 12 in. to 60 in. dia. The accompanying illustration shows the machine along with a sample pulley welded by it.

Two complete and separate welding equipments are provided, one on each side of the centre of the pulley, and each makes 60 welds per minute with a motor drive and automatic switch. The welding mechanisms move away from each other to give a clearance of 12 in. between the welding points, which are water-cooled, and will operate within a

space of 2½ in. radially from the centre of the arbor.

Feeding and stopping are automatic, the feed device being adjustable from ½-in. between welds up to 3 in. or more as desired. The stops automatically trip off and stop the machine when it reaches the separation strip on the pulley.

In addition to its large range of automatic operation, the machine is notable for the small number of moving parts and simplicity of construction. The floor space required is 50 in. by 66 in., and weight is approximately 3,500 lbs. The machine is built by the National Electric Co., Warren, O.

### WRENCHLESS CHUCK

THE accompanying cut illustrates a new development of the Barker Wrenchless Chuck, which is made by the Thomas Elevator Co., Chicago. The principal feature of this chuck is the rapidity with which the work can be handled, thus effecting a considerable saving of time in chucking operations.

The operating mechanism is in the form of a planetary-gear arrangement all enclosed within a casing, which is carried and held central on the hub of the chuck, and is kept from rotating by means of a U bar that straddles the headstock or any convenient projection fixed solid with the machine. The slot in the casing exposes the outside diameter of the movable internal gear to which the hand lever is fastened. The hand lever movement is imparted from the internal gear through suitable pinions to the cam which in turn actuates the jaws. The same action takes place while the chuck is in motion as well as when at rest.

WRENCHLESS CHUCK FITTED TO TURRET LATHE.

Since the position of the hand lever is determined entirely by the position of the bar, it is possible to change the angle of the lever merely by fastening the bar around in another position. In most cases, and especially for those turret lathes where the carriage passes the headstock and the front of the machine is taken up with control levers, the chuck is furnished with the bar fastened so as to throw in the lever about a vertical position. This, however, is entirely optional, and can be furnished in any other position that may be specified.

### EXTENSIBLE COUPLING FOR MILL DRIVES.

THE Cutler-Hammer Clutch Co., Milwaukee, Wis., has developed a new type of coupling for use with mill drives, particularly where herringbone gears are

EXTENSIBLE COUPLING FOR MILL DRIVES.

used. The extensibility of the coupling is independent of the amount of torque transmitted and is the same at no load as when full power is being transmitted. A certain amount of flexibility is also present in the clutch and this too is not affected by the amount of torque transmitted. The coupling was designed for use with a set of rubber calendar rolls but, it is pointed out, is capable of a number of other applications where an extensible coupling is desired. In designing this coupling three factors had to be taken into consideration. The coupling must transmit the necessary power between the motor and the herringbone driving pinion and at the same time leave the latter free to align itself with the gear with which it meshes and also not transmit any end thrust caused by the lateral motion of the driving shaft to the pinion.

The construction of the coupling is simple, consisting of a number of thin disks bolted together to form the disks of the coupling. The use of thin disks was decided upon as the deflection of a thin circular plate under a given load varies inversely as the cube of the thickness. While the torque transmitted by the single disk  $\frac{3}{8}$  in. thick is the same as that transmitted by three  $\frac{1}{8}$ -in. disks, the flexibility of the latter combination is nine times that of the former. In this coupling, which is 32 in. in diameter,

it is stated that the correctness of this theory has been satisfactorily demonstrated, the force necessary to cause a deflection of almost 1 in. being much less than the end sliding friction in the bearings.

### ELECTRODE PLANT FOR SHEFFIELD

THE recent installation of a number of electric furnaces in Sheffield has led to an increased demand for electrodes, which prior to the war were bought principally in the United States, although a small number were obtained from the continent. The entire supply at present comes from the United States, but according to a consular report, steps have been taken by home firms to manufacture their own supply.

A plant is being erected by the Electrode Co. of Sheffield, which has been organized with a capital of over \$200,000 for the manufacture of carbon electrodes. The promoters of this company and the majority holders of the stock are four large Sheffield firms, which have installed or have in course of installation 23 electric furnaces, with a total capacity of 90½ tons. The new company will have an output of from 3,000 to 5,000 tons of carbon electrodes per annum, which will furnish the promoters with an adequate supply of electrodes for their own furnaces, although any surplus manufactured will undoubtedly be put on the market.

### CANADIAN PATENTS

THE following is a list of Canadian patents recently issued through the agency of Messrs. Ridout & Maybee, 59 Yonge Street, Toronto, from whom further particulars may be obtained:—Gutta Percha & Rubber Co., tires; John R. Churchill, chassis for motor vehicles; Esther Murray, wheels for motorcycles and other vehicles; John F. Goodwin, gas water heater; R. B. Thomas and W. R. Davies, the manufacture of tin andterne plates; Herbert E. T. Haultain, apparatus for separating ores by flotation; Robert MacGillchrist, septic tank syphon; John G. Robinson, steam superheater for locomotive boilers; Gutta Percha & Rubber, flat water pail; Thomas Rigby & Nils Testrup, utilization of peat; Franklin Camfield, waggon wrench; Harry G. Akers, process of producing barium and strontium oxides; Michal Migasnick, plow; John G. Robinson, apparatus for use on locomotive or like engines fitted with steam superheaters; The Williams, Greene & Rome Co., dress shirt; James H. Lumbers, intrenching tool; Georgetown Foundry and Machinery Co., knitting machine; Albert H. Power, register for hot air heating apparatus.

### TRADE INQUIRIES FROM GREAT BRITAIN

THE following inquiries relating to Canadian trade have been received by the Department of Trade and Commerce, Ottawa:

935. Wire Nails.—A Leeds firm, using annually about 500 tons of wire nails, wishes to hear from shippers of this commodity.

939. Electrical Plant and Accessories.—An Edinburgh firm is desirous of receiving quotations from Canadian manufacturers.

950. Mining and Railway Supplies.—A Johannesburg firm of thirty years' standing are prepared to take up Canadian agency in rails, all kinds, and supplies, railroad cars and coaches, locomotives, creosoted sleepers, mining machinery of every kind and supplies. Immediate correspondence is requested, as this firm is in a position to secure immediately very large orders.

990. Wolfram Ore, Molybdenite and Ferro Chrome.—A Sheffield firm of steel manufacturers makes inquiry as to Canadian producers of the above.

991. Wire Nails.—A Leeds firm is in the market for twenty tons of wire nails.

992. Engineers' Tools, Chucks, etc.—A Leeds firm of ironmongers desires to hear from Canadian manufacturers of engineers' and joiners' tools, and especially 4-inch, 6-inch and 8-inch self-centering chucks.

994. Tungsten, Molybdenum, Vanadium and Cobalt.—A Sheffield firm of steel manufacturers makes inquiry for Canadian producers of the above in the refined state.

995. Steel Billets and Blooms.—A Sheffield firm wishes to receive quotations from Canadian firms in a position to export the above.

1014. Mining Equipment.—A firm of importers of mining equipment in Cape Town, South Africa, having close connections with many of the South African mining companies, ask tenders from Canadian manufacturers for the following supplies: (a) For a gold mining company, machine-cut gears, cast steel, spur and pinion; quote weights and prices. (b) For a coal company, 300 steel trucks and 325 sets of wheels; one hundred tons 16-pound section rails with 3-inch centre holes for fish plates for 150 tons of rails and sufficient bolts for 200 tons; two tons of dog spikes for fastening rails to wooden sleepers. (c) A mine roller, 20 inches by 5 inches; the number of rollers and bearings required. 300. Blue prints have been forwarded to the Commercial Intelligence Branch, Department of Trade and Commerce, Ottawa.

1034. Siemen's Steel Billets.—A Sheffield firm, who are regular buyers of Siemen's steel billets, wishes to hear from Canadian exporters.

### COAL SCARCITY IN CANADA

**T**HE scarcity of certain varieties of coal continues to be a matter of first importance, not only in regard to the supplies available for shipping, but relative to the requirements of manufacturing establishments as well. That there will be no coal in the country by March 15, 1917, is the forecast of one official. The Dominion Coal Co. reported some time ago that it was bunkering large supplies of coal for use on Government transports in anticipation of an acute famine on the St. Lawrence route, and recent developments in widely separated quarters continue to emphasize the seriousness of the situation in its every aspect.

In Eastern Canada, manufacturing and power plant institutions are very largely dependent for the supply of bituminous coal for steam raising and other purposes on the output of the mines in Cape Breton, and while at first sight the lack of available "bottoms" which is generally known to exist contributes in part to the decreased and decreasing receipts by consumers, other influences have been and are at work, the effects of which are still more far-reaching. In a word, production has been declining each month during the present year; shortage of men is the sole reason for the falling production, and enlistment for overseas service may be accepted as the sole reason for the labor shortage. During the year 1915, from January 1, until September 30, the output of the Dominion Coal Co. collieries at Cape Breton showed a steady increase from 287,000 tons in the former month to 452,000 tons in the latter month, or a grand total for the nine months of that year of 3,666,000 tons. In January of the present year the output amounted to 407,000, this total being maintained very approximately up until the end of March. In April the output fell to 378,000 tons rallying slightly in May to 383,000 tons since when there has been a steady decrease, the figures for September being around 345,000 tons. Should the rate of decrease continue, and there is little hope of its being arrested, the output for this year will show a falling off of probably three-quarters of a million tons.

In conversation with a gentleman in close touch with coal production elsewhere as well as here in Canada, we learn that instead of a decreased output being allowed to materialize abroad, special efforts have been put forth to intensify production, the various Governments concerned

realizing as Canada's has not, that coal and especially bituminous coal is the basic munition in the war in which we are engaged. As if, however, ill-directed enlistment had not been sufficiently effective to restrict production, we understand that some 1,800 men left the Maritime Provinces in August to harvest in the West, the half of whom were taken from the mines and munition plants of Nova Scotia. A majority, if not all of those men were carried all or part of the way West on our Government Railroad, and of course at a low and attractive rate. Taken in conjunction with the lack of regulation of enlistments, it is plainly evident that the importance of coal for our manufacturing and power plant requirements is still unrealized by responsible Government.

### RAILROAD PUBLICITY

**A** WEEK ago at the monthly meeting of the Canadian Railway Club, Montreal, the subject of Railroad Publicity was discussed in a paper by Walter Thompson, of the Grand Trunk Railway System Press Bureau. In common with most of us, Mr. Thompson believes that railroad "baiting" is on the wane—everywhere we might add; in any case so far as Canadian railways are concerned it has not to our knowledge, or from observation, at any time assumed ugly proportions and been over-menacing in attitude. Railroad "baiting," however, and wherever practised, has of course nothing to commend it, and in the ultimate analysis is usually barren of result; nevertheless, whether extreme or moderate of display, it may be averred that railroad executives in the past stuck too tenaciously to their "perch" of silence and indifference.

The establishment of publicity bureaux and the gradual development of the work and scope of these has broken down the wall of public prejudice against railroad administration and operation, while that offspring of the publicity department—the Employees Magazine, has contributed a full measure to the success achieved. No auxiliary of railroading, or for that matter, of any other business enterprise whose activities call for great plants and great numbers of employees, makes bid for the like quality and quantity results as regards co-operative service. Everything that transpires is departmentally allocated a place in the editorial columns each month, and as a result the individual interest becomes merged in that of the institution as a whole. It may not be assuming too much to observe that, in addition to the inside benefits which have been procured by keeping executives and employees in close touch by means of the Magazine, the latter in the hands of the employees has borne a large part in breaking down and removing almost entirely pre-existent public prejudice, particularly in the sphere of railroading.

In the course of the paper, reference was made to the reticence of executives regarding the work of the "road," and the opinion was expressed that a desirable publicity would be of considerable inherent value. To quote the author, "you may create a publicity department with all the literary and journalistic genius of the age, but if it has not the full co-operation of all officers of the road; if they are not keenly interested in its activities, and willing to render it ready support, it will fail to do good work. Keep the publicity end of the road in view every day for ways in which it may assist your department and the service as a whole." That there is room for a keener interest in and still more ready support to even the best organized and directed railroad publicity departments by executives individually and collectively, goes without saying, for here as in every other sphere of industrial and commercial enterprise, the need is a daily development and growth.

## INDUSTRIAL NOTABILITIES

**C**HARLES GORDON McGHIE, manager and secretary, Welland Vale Co., manufacturers of hand agricultural implements, special forgings and edge tools, St. Catharines, Ont.; director, Canadian Crocker-Wheeler Co.; vice-president, Metal Drawing Co.; vice-president, Wallingford Mfg. Co., Wallingford, Vt.; president, Bedford Mfg. Co., Bedford, Que., also interested in many other Companies, was born at St. Catharines, Feb. 16, 1868, son of the late William and Christina (Gillespie) McGhie, of Scottish ancestry. He was educated in Public Schools and Collegiate, St. Catharines, and began his business career as office boy with Whitman & Barnes, St. Catharines. During the period from 1881-88 he was successively clerk and bookkeeper; traveling

CHARLES GORDON McGHIE.

salesman, 1888-1890; traveling salesman, Welland Vale, 1890-1895; traveling salesman, Whitman & Barnes, 1895-1900; special representative to Australia for Welland Vale Mfg. Co., 1900-1901; Eastern representative for the Welland Vale Co., and president of the Bedford Company, Montreal, 1901-1904; bought out the J. H. Wetthey Co., St. Catharines, 1904-1905; has been secretary and office manager, Welland Vale Co. since 1905.

Mr. McGhie has been a member of Water Commission, St. Catharines, for the past eight years, and was largely instrumental in building a larger water-main service, thereby greatly increasing water supply. He devoted much of his time and effort to building up the export trade of the Welland Vale Co., which is considerably larger now than the home trade; one of the organizers of the Metal Drawing Co., munition manufacturers in St. Catharines. As an industrial worker for St. Catharines he has succeeded in locating different industries there. He is a member of finance committee of the Patriotic Fund, and takes an active interest in patriotic work.

Mr. McGhie married Harriet Junkin, daughter of Alexander Junkin, Nov. 12, 1890; the family consisting of two sons and one daughter. His clubs are: St. Catharines; Niagara (New York); Albany (Toronto); his society, A.F.&A.M.; his recreations, golf, lawn bowling, motoring. In politics he is conservative, and in religion, Anglican. His residence is 151 Ontario St., St. Catharines, Ont.

further advances will feature the market in the near future. Railroads and structural engineers are demanding increased tonnage. The volume of business being placed by railroads for steel rails is very large, but, owing to the condition of the mills, delivery on some of the orders run into 1918. In many respects the situation in plates is under greater tension than at any previous period. Added to the call from railroads and shipbuilders, the export demand is of such a volume as to cause uneasiness in these circles, and to some extent a partial famine is anticipated. While no general advance is reported, it is believed that offers have been made involving premiums on current quotations. The sheet situation has experienced another adjustment in prices, and as was expected, is an advance on previous quotations. Black and blue annealed sheets, Pittsburg, have been advanced \$5 per ton the former being quoted at \$3.50 and the latter at \$3.35 per hundred pounds. The price on galvanized sheets is now \$4.50 Pittsburg, being an advance of \$2 per ton. An additional \$1 per ton has been placed on the Pittsburg quotation for iron bars, the current price ranging from \$2.70 to \$2.75 per hundred pounds. Recent demand has been quite heavy. The consumption of wire and wire products is still very large, and a revision of prices is expected shortly. Steel hoops have been affected by the recent advance, the quotation of \$3.25 Pittsburg, representing an advance of \$5 per ton. Wrought iron pipe, and also boiler tubes are still in good demand. Furnace coke for immediate delivery is now \$4.50 per ton, an advance of 50 cents per ton.

**Metals**

The general situation in metals is comparatively unchanged. Copper is very firm with prospect of further heavy buying. Tin is becoming easier after the scare of last week. Spelter continues dull, and lead is quiet but firm. Antimony and aluminum are a little stronger.

**Copper.**—In comparison with recent developments, the copper market is quiet, although considerable interest is still being shown and some good inquiries are reported. The consumption of this metal is very heavy at the present time, both for domestic and war purposes. Copper is being used in such enormous quantities just now, that the fear is prevalent that the production will be insufficient to cover the future requirements of the trade. If consumers should be confronted with a situation of this nature, it is more than possible that higher prices would prevail. However, both smelters and refiners are steadily increasing their facilities, in order to cope with the abnormal

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Oct. 16, 1916.—The industrial situation has apparently reached another stage in its history as indicated by the further price increases on many lines of steel and metal products. To say that the summit will soon be reached, only adds another to the prophecies that have been advanced at various periods in the past, only to be exploded by subsequent developments. That the apex has however been reached in some directions is shown in the slackening off of certain enterprises involving the use of steel for domestic purposes until lower prices prevail. The higher prices may as a consequence place additional facilities at the disposal of shell steel producers.

**Pig Iron**

The market in pig iron has taken on additional strength, this being indicated by a general advance of from 25 cents to \$1 per ton. While no change has been made in local circles, an advance here is expected.

**Steel**

No cessation appears evident in the upward movement of steel and steel products. The continued advances that mark the trend of the ever increasing volume of business may result in the curtailment in certain lines of domestic activity, until a lower level is again reached. That the present conditions will prevail for some time is not only probable, but it is more than likely that

demand, and unless exceptional pressure is placed upon the producers, the situation will not likely develop any serious features. The recently placed order for the Allied Governments for about 250,000 tons of copper, is reported to be insufficient for intended requirements, and it is possible that further tonnage will be booked shortly. The London market is strong having advanced £3 on spot and £2 on futures. The local situation continues steady with prices very firm, lake and electrolytic 31c and castings 30c per pound.

**Tin.**—Developments of submarine activities during the earlier part of last week was the cause of a sharp advance in tin, which followed in the wake of a highly excited market. However, like many a previous scare, the uneasiness was only temporary, the situation having become easier and quotations gradually resuming their former level. While heavy sales are not reported, it is believed that considerable business is being done in a quiet way, more especially for early futures. Local dealers were not much affected by the recent activities, quotations being firm and slightly stronger, this week's quotation showing an advance of  $\frac{1}{2}$ c, the price being 44 $\frac{1}{2}$  cents per pound.

**Spelter.**—It is apparently impossible to break the dullness of the spelter situation. The stronger tendency that seemed to be developing, has been replaced by a contrary tone that reflects itself in lower prices. The actual condition of the market is difficult to determine, as the larger interests are not actively in the market, and present quotations are based on visible activities. The dullness is partly accounted for by the large volume of high grade scrap on

the market, which the brass mills are absorbing. The London situation has shown a little improvement and prices have advanced from £2 on spot to £2 $\frac{1}{2}$  on futures, but the New York market has declined  $\frac{1}{8}$  cent, the current quotation being the nominal price of 10c per pound. Dealers here report a quiet market, with an undertone of weakness, but prices are steady at 13c per pound.

**Lead.**—Nothing has developed to change the general tone of the market, firm price quotations being maintained. Production is still equal to consumption, but the market activity is not pronounced, and neither producers or consumers are showing much interest in the situation. Under these circumstances, prices are well maintained; the Trust quotation being 7c, and the independents asking from 7 to 7 $\frac{1}{8}$ c. The London market is firm and higher, while the local market is steady with quotations unchanged at 9c per pound.

**Antimony.**—Owing to the activity in bonded metal, the market in antimony has taken on a little strength, resulting in advances on listed quotations. Local dealers are quoting last week's price of 15c per pound.

**Aluminum.**—New York reports an advance of 4c per pound on No. 1 Virgin, following increased market activity. The situation here is firm with prices unchanged at 70c per pound.

#### Machine Tools and Supplies

While the demand for machine tools continues steady, the requirements are not such as they would be were more labor available. Manufacturers are experiencing some difficulty in keeping the machines now installed in operation, and until more help is available the

calls for additional equipment will probably decrease. However, the volume of business is still satisfactory and inquiries for domestic purposes promises well for the future. Supplies of all kinds are in good demand; deliveries in some cases being extended to the discomfort of the consumer.

#### Scrap

The situation as regards old materials is following the lead of steel, quotations for scrap materials showing advances on the American market which will likely be reflected here shortly. At present dealers are asking last week's prices.

**Toronto, Ont., Oct. 17.**—Although shell plants are still many months behind on deliveries, considerable improvement is looked for in the future, as the Imperial Munitions Board announced recently that the supply of steel and forgings was more satisfactory and no interruptions in output are likely to take place on this account. A number of new plants are now ready to turn out the larger shells. The new order for munitions to the value of \$60,000,000 will stimulate the industry and incidentally brings the total of orders placed this year up to \$185,000,000.

The principal feature in the industrial world as it affects the machinery and steel trades is the steady advance in prices of raw materials. At the present time there appears to be no limit to the upward movement in prices. The scarcity of steel is becoming a serious matter, and the situation is becoming more acute as time passes. Consumers are confronted with a difficult problem, having to wait at least twelve months for delivery, which is a serious handicap to business,

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

**BRAZIL**  
Bahia, British Consul.  
Rio de Janeiro, British Consul General.  
**CHILE**  
Valparaiso, British Consul General.  
**COLOMBIA**  
Bogota, British Consul General.  
**ECUADOR**  
Quito, British Consul General.  
**EGYPT**  
Alexandria, British Consul General.  
**FRANCE**  
Havre, British Consul General.  
Marseilles, British Consul General.  
**INDIA**  
Calcutta, Director General of Commercial Intelligence.

**ITALY**  
Genoa, British Consul General.  
Milan, British Consul.  
**MEXICO**  
Mexico, British Consul General.  
**NETHERLANDS**  
Amsterdam, British Consul.  
**PANAMA**  
Colon, British Consul.  
Panama, British Vice-Consul.  
**PERU**  
Lima, British Vice-Consul.  
**PORTUGAL**  
Lisbon, British Consul.

**RUSSIA**  
Moscow, British Consul General.  
Petrograd, British Consul.  
Vladivostok, British Consul.  
Odessa, British Consul General.  
**SPAIN**  
Barcelona, British Consul General.  
Madrid, British Consul.  
**SWEDEN**  
Stockholm, British Consul.  
**SWITZERLAND**  
Geneva, British Consul.  
**URUGUAY**  
Monte Video, British Vice-Consul.  
**VENEZUELA**  
Caracas, British Vice-Consul.

particularly to those using steel in the manufacture of their product.

#### Steel

The situation in the steel market is getting tighter and the upward movement in prices continues without any sign of a reaction. The steel market was never stronger and deliveries never so backward, the first quarter of 1918 being named in some cases as the best delivery that can be made. In fact, buying of bars, plates and shapes, and steel products generally, for delivery in 1918, is the outstanding feature of the steel situation. During the week prices on steel bars were withdrawn by some mills, being followed later by an advance of 10c on both iron and steel bars. Iron bars are now quoted at \$3.35, and steel bars at \$3.50 per 100 lbs. Cut nails have advanced 30c, and are now quoted at \$3.75 per 100 lbs. base, while pressed steel spikes are higher at \$4.10 per 100 lbs. base. The expected advance on boiler tubes has materialized; lapwelded tubes, however, only are affected. The advance is equal to \$3 per 100 feet, and is due to the big demand for tubes and the sold-up condition of the mills. Several of the largest are not taking orders for delivery before the second and third quarters of 1917. The situation in plates is getting tighter, and a famine exists in the primary market. Not only is the export demand heavy, but there is also an enormous demand from shipbuilders for plates. An advance in prices of plates is looked for in the near future.

The high-speed tool steel situation shows little or no improvement, as the increase in output is offset by the increased demand. A few months ago the market was easier, but recently has become considerably firmer. The importations from England are insignificant owing to the big demand in Great Britain from munition plants, and also from France and Russia. The demand is so pressing that high-speed steel scrap is carefully collected for remelting to minimize loss as much as possible. While the production of tungsten has considerably increased, available supplies are quickly absorbed by the steel makers. A fair amount of high-speed tool steel is coming in from the States, but not in sufficient quantities to meet the increasing demand.

The sheet market is very firm, following the higher prices recently announced by the American Sheet & Tin Plate Co. at Pittsburgh. The new prices are \$2 per ton higher on galvanized sheets and \$5 a ton higher on blue annealed and black. The new prices are as follows:—Blue annealed, \$3.25; black, \$3.40; and galvanized, \$4.50. These prices are for Bessemer, open-hearth being \$2 a ton higher. Local prices are consequently very firm, and will likely advance in sympathy with the United States market.

The United States Steel Corporation statement for September showed a decrease of 137,733 net tons in unfilled orders on its books, the total orders amounting to 9,522,584 tons. This does not mean that the demand for steel has slackened, as practically all the mills in the United States have been declining large volumes of new business during recent months. It has been stated that the U. S. Steel Corporation has enough business on its books to guarantee steady operation for the next eight months even if it fails to book another ton. The demand for steel in the United States is more pronounced than a month ago, and the market is very strong, with prices advancing. The shortage in supply of sheet bars and billets is getting more acute and prices are higher. Export business is still heavy, but the domestic demand has assumed considerable proportions, particularly as regards rails and plates, the demand for the latter being very heavy. There is a great scarcity of billets and sheet bars, and prices are very firm, with an upward tendency. Steel bars are being quoted at 2.75c.

#### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

plates 4c, and shapes 2.75c Pittsburgh; delivery at mill convenience.

#### Pig Iron

The continued strength in the pig iron market in the U. S. is reflected locally, and prices on domestic pig irons have advanced \$1.50 per ton. The advance is somewhat belated, and is due principally to higher prices in the States. The sharp advances in the pig iron market in the States are taken to indicate that Lake Superior iron ore prices next year will be higher. Coke also is advancing. Hamilton and Victoria brands are now quoted at \$25.50 per ton. Gray forge, Pittsburgh, has advanced again, and is now quoted at \$20.45 per ton. Lake Superior charcoal iron is also higher at \$20.75 per ton, Chicago. Bessemer is now \$23.95, and basic, valley furnace, \$20 per ton.

#### Scrap

With the exception of wrought and cast iron scrap, the market is strong and prices firm. The situation as regards steel turnings has improved, as the Dominion Government has given permis-

sion for limited quantities to be exported. Hitherto this material has been accumulating, there being practically no market for it in Canada, as sufficient steel scrap, such as heavy melting, has been available, and is preferred by the mills. The only important change in prices to note is an advance of 1c per pound in light copper.

#### Machine Tools

The statement issued by the Imperial Munitions Board that the difficulty of obtaining forgings has been overcome will improve the situation in the machine tool business. Increased activity may also be expected following the placing of contracts covered by the new order for munitions to the value of \$60,000,000. This, it is believed, will be principally for shells of large calibre.

#### Supplies

Prices of machine shop supplies continue to advance, due to the steady increase in cost of raw materials, particularly iron, steel and brass. Wood pulleys have advanced 10 per cent., the discount which was 50 per cent. being now 40 and 10 per cent. All lathe and drill chuck lists have been cancelled pending the announcement of higher prices. A new and standard list is being prepared covering all lines of chucks which will be subject to standard discounts. A new discount of 35 per cent. has been issued on black rivets and burrs. Stove bolts now carry a discount of 60 per cent.; machine bolts,  $\frac{3}{8}$  in. and less, 30 per cent.; machine bolts, 7-16 in. and larger, 20 per cent. A new discount of 65 and 5 per cent. has been announced on practically all makes of files except Nicholson, which is unchanged at 55 per cent. Linseed oil is stronger, and quotations are higher at \$1 for raw, and \$1.03 for boiled oil. Turpentine is weaker, but unchanged at 71c per gallon.

#### Metals

A quieter tone characterizes the metal markets this week, but prices have been well maintained, with the exception of tin, which has declined, the market having recovered from the excitement caused by the recent submarine activity. The copper market is still very strong, and is in an excellent position, with quotations unchanged. Lead and spelter are quieter, but antimony is firmer on better demand. Business locally continues good, and the outlook generally is favorable.

**Copper.**—The strength in copper continues undiminished, producers reporting that while the volume of business is gradually tapering off, fair orders are still being taken from domestic consumers. The Italian Government has come into the market for about one million pounds of copper. Owing to the enormous demand for copper, there is some fear of a shortage, and higher

prices may yet be recorded. Local quotations are firm and unchanged at 31c per pound.

**Tin.**—The submarine scare having quickly subsided, the tin market recovered, although it is still irregular on prompt metal. The market, however, is firm and higher on futures. Tin has declined 1c locally, and is quoted at 46c per pound.

**Spelter.**—The market is dull, with little business passing. There is considerable uncertainty in the market, and the large interests are waiting until the situation clears before coming into the market. Local price is 14c per pound.

**Lead.**—Business is quiet in the lead market, as neither buyers nor sellers are showing much inclination to do business. The Trust is maintaining the price of lead at 7c, New York. Local price, 9c per pound.

**Antimony.**—Quotations are nominal and unchanged, although the market is firmer and demand heavier. Local quotation is 18c per pound.

**Aluminum.**—The market is more active, but quotations are unchanged at 68c per pound.

### U. S. COPPER EXPORTS

IN view of the large orders for copper placed in the United States by the Allies during the past few days, the following figures showing the exports for eight months ending August 31st last, in tons of 2,240 pounds, are significant:

	1916.	1915.
United Kingdom ....	51,738	57,015
France .....	105,398	62,592

Sundries .....	2,654	1,597
Total .....	215,199	171,786

### TRADE OPPORTUNITIES IN THE WEST INDIES

JAMES E. DOBBS, who as a representative of the Canada India League, spent ten weeks in the British West Indies and in Trinidad in particular, has returned to Toronto firmly convinced that there are vast opportunities for the development of Canadian trade in the West Indies. There is there, Mr. Dobbs declares, a prevailing opinion that almost all sorts of Canadian products can find a ready market if advertised and sold by competent representatives who would see that the goods were prepared and packed to suit tropical conditions. The Canada India League is interested in bringing about a closer bond of sympathy among the colonies of the Empire and eliminating any social, religious or racial prejudices which might exist, and Mr. Dobbs spent considerable time in Trinidad, where men from the East Indies form one-third of the population, in studying the social, commercial and domestic life of the men from the East Indies.

## CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

### CANADIAN TRADE COMMISSIONERS.

# INDUSTRIAL <sup>A</sup><sub>N</sub><sub>D</sub> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**Rainy River, Ont.**—Blackmore Bros. will build a machine shop to cost about \$15,000.

**Merrickville, Ont.**—The Percival Plow & Stove Co. plant was destroyed by fire recently.

**Toronto, Ont.**—The Hamilton Gear & Machine Co. will build an extension to their plant to cost about \$5,000.

**Renfrew, Ont.**—Imbleau & Sons propose building a foundry and machine shop, which will cost about \$3,000.

**Alton, Ont.**—The Alton Foundry Co. is in the market for 3-phase, 60-cycle, 220-volt motors of 5, 10, 15 and 25 h.p.

**Glenora, Ont.**—J. C. Wilson & Co. have purchased a site for a new machine shop, which will be of brick construction. The building will cost approximately \$15,000. Some new machine tools and shop equipment will be required.

**Merritt, B.C.**—Over 175 tons of fabricated steel are required for the new addition to the leaching building of the Consolidated Co. electrolytic zinc plant at Trail. The new building is 165 x 200 feet, and the work of erection is well under way.

**Steveston, B.C.**—The rolling mills in the old Dominion Safe Works, at Bridgeport, which were burned to the ground about a month ago, have been opened again in a temporary way, but arrangements are under way for the re-building of the structure.

**Amherstburg, Ont.**—A Canadian branch of the Solvay Process Co. of Syracuse, N.Y., is about to be established at Amherstburg. The plant, it is said, will be erected near the Limestone quarries, Anderson Township, to supply all Canadian territory in soda ash. Reports from Syracuse state that an issue of \$300,000 of stock has been made to provide funds for building and equipping the new plant.

**Hamilton, Ont.**—The Hamilton Steel Wheel Co. has purchased a site, and will erect a plant, costing \$200,000, for making steel wheels, which product was formerly furnished by Germany and the United States. This industry will give employment to about two hundred men, and will turn out about seventy-five tons of steel wheels per day. C. W. Sherman, of the Dominion Steel Foundry Co.,

will be managing director of the new concern.

**Ottawa, Ont.**—The aeroplane factory to be established in Canada, probably in Toronto, will cost, it is reported, approximately a million dollars, and will be equipped to turn out six machines per week. These machines, as stated previously, will be purchased by the Imperial Government. The supervision of all matters connected with the establishment of the factory will probably be entrusted to C. S. Wilcox, of Hamilton, chairman of the Steel Company of Canada.

**Vancouver, B.C.**—The P. G. E. R. is about to commence erection of machine shops, store buildings, scales, etc., at Squamish. The new construction is to be strictly modern, and will cost approximately \$100,000. At East Lillooet also, 120 miles above Squamish, and selected as the railway divisional point, immediate construction of round-house and divisional headquarters buildings will be commenced, this work to cost \$50,000. A. H. Sperry is general manager of the railway company.

## Electrical

**Dublin Township, Ont.**—The Township Council will shortly submit a by-law to authorize the installation of a hydro system.

**Woburn, Ont.**—A petition, signed by over 400 ratepayers, has been presented to the Township Council asking for the installation of the hydro-electric system. The petition has been referred to the Hydro-Electric Commission for approval.

## General Industrial

**Montreal, Que.**—The Thomas Davidson Mfg. Co. will build an extension to their factory here.

**Montreal, Que.**—Fire at the Gagnon Co. boot and shoe factory recently did damage to the extent of \$200,000.

**Quebec, Ont.**—Arrangements have been made whereby the Dominion Fibre Co. of Doon, whose premises there were burned out about two months ago, will locate in Guelph, taking over the old Grundy stove foundry near Grow's Bridge.

**Steveston, B.C.**—R. D. Rorison interviewed the council recently, asking for free water and exemption from taxation for an industry which will employ a large number of men and occupy at least 400 acres of land. No action was taken by the council, but it is expected that more definite proposals will be made in a few days.

**Victoria, B.C.**—The re-establishment on a much larger scale of the industry formerly carried on by the Sidney Cannery will shortly be undertaken by the Sidney Cannery Co., a new concern which has been incorporated to take over the business. Messrs. Charles F. Goode-rich and H. E. Sims, of Port Angeles, men prominent in the cannery industry on this coast, and who will invest a considerable amount of capital in the new concern, are the prime movers in the scheme. The company is capitalized at \$40,000. They contemplate adding extensively to the plant at Sidney, and will install modern machinery.

## Trade Gossip

The Berlin Rubber Mfg. Co., have changed the name of the concern to that of the Kitchener Rubber Mfg. Co.

**Fernie, B.C.**—The Rambler-Cariboo Mining Co. has contracted with a United States refining concern to take over 800 to 1,000 tons of zinc now held for treatment at that mine.

**Kingston, Ont.**—The feldspar industry is booming in Frontenac. Four companies are now exporting the mineral and a fifth company will shortly be at work. The total value of the feldspar exported from Frontenac will be over \$100,000, or twice as much as last year.

The Boss Lock Nut Co., have recently been incorporated in Canada to manufacture lock nuts for railway, constructional and industrial use. T. W. Coleman formerly manager of the Grip Nut Co., is now manager of the new concern with offices at 901 Eastern Townships Bank Bldg., Montreal.

The Canadian Fairbanks-Morse Co., have opened a branch sales office at Windsor, Ont., in order to take care of their increasing business in Western Ontario. J. N. Charles will be in charge of the office.

**British Import Prohibitions.**—A proclamation of October 3 provides that the

Co., Ltd., Toronto, Winnipeg, St. John, N. B.

If any advertisement interests you, tear it out now and place with letters to be answered.

following articles will be treated as absolute contraband in addition to those set out in royal proclamations:—Insulating materials, raw and manufactured; fatty acids; cadmium, cadmium alloys, and cadmium ore; albumen, aluminum powder, bone, horn, ivory, and celluloid.

**Increase in Building Ships.**—An announcement from London states that a substantial increase in merchant shipping under construction for the three months ending October 1 is reported by Lloyds. The report shows that on Oct. 1 there were 469 vessels building, representing a total of 1,789,054 tons. This represents about 249,000 tons more than the amount under construction at the end of the previous quarter, and 253,000 tons more than that building a year ago.

**To Capture Russian Trade.**—A. Melville Dollar, of the Dollar Steamship Line, with offices in Vancouver, B.C., is of the opinion that that city should take similar steps along the line that Seattle is doing to capture the Russian trade. Seattle has formed a \$2,000,000 corporation to go after this trade, and Mr. Dollar is of the opinion that the best way for Vancouver to go after this trade is to form a corporation also. Vancouver has as good a chance of getting the trade as Seattle, he says.

**The Tungsten Market.**—The tungsten market is more active in the U.S. Large sales of concentrates for next year's delivery have been made at about \$17 per unit for 60 per cent. ore. At least 200 tons of ferrotungsten has also been sold, part of it for foreign consumption, England being the principal purchaser. The price paid was \$2.60 to \$2.75 per lb., New York, of contained tungsten. An incident connected with England's purchase is that one lot was taken from an American producer whose name appears on the British supplementary black list.

**The British Columbia Copper Co.,** of Greenwood, B.C., will discontinue the shipment of copper across the border after the 1st of November, the Consolidated Mining & Smelting Co. having contracted to handle the entire copper product of that company. This latter company have just completed an electrolytic plant which will have a capacity of from five to ten tons of the red metal daily, and their facilities for handling zinc concentrates will soon enable them to take care of the larger part of the product of the zinc mines of the Kootenay-Boundary district.

**Marine Motors in China.**—While there are at present perhaps not more than a dozen marine motors in the vicinity of Amoy, this should become a good market for marine motors and sundry supplies, as the Chinese are becoming more

and more acquainted with the use of motors and the great advantage derived through them. At present practically all of the local traffic is carried by sailing boats, which is both slow and expensive. If the benefits of marine motors were properly displayed, say by a demonstration agent, and a local agency opened, good results would undoubtedly follow.

**B. C. Producing Copper.**—The electrolytic copper refinery at Trail, B.C., which has now been in operation for a few weeks, will shortly begin the shipment of electrolytic copper. The melting building—where the copper sheets as taken from the tanks are melted into shipping shape—is now completed, and the reverberatory furnace in which the melting will be done is almost ready. After that the plant will begin turning out and shipping pure copper at the rate of some five tons daily—the first product of its kind in Canada. The capacity of the plant, according to Superintendent John F. Miller, who also has charge of the electrolytic lead refinery, is ten tons daily.

**Britain First in Coal.**—Germany, even in war time is producing considerably more iron and steel than the United Kingdom, and the territories she has seized are no doubt being used to augment her supplies. The following is a comparative table:—

Pig Iron:	1913	1915.
United Kingdom	10,479,000	8,793,000
Germany	19,291,000	11,789,000
Steel:		
United Kingdom	7,663,000	8,550,000
Germany	18,958,000	13,258,000

In coal, Britain continues to hold the first place in Europe by a long lead, though the production in 1915—253,179,000 tons—showed a substantial drop from the 1913 figure—287,411,000 tons.

**Exemption of Gold Mining Machinery.**—A Russian Imperial Decree has been issued exempting from duty for a period of ten years the following machinery and apparatus for use in gold mining:—Dredges and excavators and parts thereof; apparatus for grinding gold-bearing ore or for the chemical extraction of gold from ore and prospecting apparatus, together with parts thereof. The latter are entitled to free admission, whether or not imported at the same time as the principal article. The measure is retroactive, providing that all duties collected on such machinery and apparatus since January 1, 1916, shall be refunded. This concession is a restoration of an exemption which was in effect prior to January, 1909.

**B. C. Mineral Exports.**—The total exports of copper from the Fernie district during the first nine months of this year amounted to 4,741,861 pounds, valued at

\$1,320,468. Gold, for the last quarter, made a total export of 7,094 ounces, valued at \$171,329. The value of silver exports for the same time was \$52,664; zinc to the value of \$160,074; and lead valued at \$1,042, were sent over the line. Timber products to the value of \$97,692 were exported. Included in the timber products was 1,178,400 feet of white pine lumber, sent to a large match manufacturing concern in the United States for use in the manufacture of matches. Coal and coke to the value of \$305,455 go to make up the total.

**Newcastle, N.B.**—A deal is reported to be near completion between the Partington Pulp & Paper Co. in New Brunswick and leading capitalists in Maine. It is said that more than one million dollars capital will be put into the proposition. Included amongst the capitalists who are interested is Hugh Chisholm, of Portland, Me., who is intimately connected with the International Pulp & Paper Co. The property under consideration is said to include mills at St. John, Marysville and Blackville, and timber limits on the Nashwaak and other streams. It is not at all improbable that a larger pulp mill will be built at Blackville. N. M. Jones, of St. John, is manager of the Partington Pulp & Paper Co.

**U. S. Exports to Russia.**—United States exports to Russia, via Vladivostok, January 1 to April 1, 1916, aggregated \$31,497,280, according to the report recently of the American-Russian Chamber of Commerce at 60 Broadway, which obtained the data from the Russian-American Chamber of Commerce at Moscow. A wide variety of merchandise is included in these exports. Iron and steel and similar products aggregated approximately \$8,000,000; other metal products, \$3,000,000; machinery, \$7,655,000; transportation supplies, \$5,574,000; textiles, including raw cotton amounting to \$4,365,000, and cloth and other woollen fabrics, to the amount of \$1,280,000, reached a total of \$5,726,000; chemicals, drugs and dyestuffs, \$452,000; and leather, \$982,000.

**Minerals in Newfoundland.**—The Government geologist estimates the iron ore deposits in Newfoundland at 3,635,500,000 tons. On Belle Isle, Conception Bay, alone, the estimated deposit of this ore is put at 35,000,000 tons, and more. The total ore mined and exported since the beginning of operations in 1895 to date is estimated at 15,000,000 tons, all of which, prior to the war, went to the United States, United Kingdom, Canada, the Netherlands, and Germany. Since the outbreak of the war none has gone to Germany, and but little to the United States, the United Kingdom, and the Netherlands. Canada has taken the major portion, much of which is being utilized for munition purposes.

# Aikenhead's DUMORE SENSITIVE DRILL

is especially adapted for the use of jewelers, watchmakers, instrument manufacturers and gold and silversmiths. The Feed control which is equipped with a spring balance is extremely sensitive and the most delicate piece of work can be drilled accurately and rapidly.

### Specifications :

Height—18 inches.

Weight—17 lbs.

Stroke—2 inches.

Drills to center of a six-inch piece.

Drilling capacity:

Steel, 0 to 3-32".

Brass, Aluminum and soft alloys, 0 to 13-64".

Equipped with a high speed Universal Motor which operates on either D. C. or A. C.

Speed 8,000 R. P. M.

Imported S. K. F. Ball Bearings eliminate vibration.

## Municipal

**Kingsville, Ont.**—The Town Council propose having improvements made to the waterworks system.

**Scarborough Township.**—The Township will petition the city to extend its water main service throughout the district as the need arises.

**New Westminster, B.C.**—Negotiations are still under way between the City Council and John R. Duncan regarding a site for an extension to the Vulcan Ironworks.

**Hamilton, Ont.**—Plans will be prepared for waterworks buildings and equipment, including a high-duty triple expansion steam unit and steam turbine, to cost \$300,000. E. R. Gray, city engineer.

**Port Hope, Ont.**—The town carried the Port Hope Sanitary Mfg. Co. by-law on October 10 by a vote of 343 for and 8 against. The by-law provides exemption of taxes. The company will pay the town \$650 rent per year for the land.

## New Incorporations

**The Exolon Co. of Thorold, Ont.**, makers of abrasive materials have been granted a supplementary license to carry on business in the Province of Ontario with a capital not to exceed \$275,000.

**The White Co.**, has been incorporated at Ottawa with a capital of \$40,000 to manufacture motor cars and trucks with head office at Toronto. Incorporators are W. M. Cox, H. A. Harrison and W. J. Beattie all of Toronto.

**The James McKay Co.**, of Pittsburgh, Pa., manufacturers of chains and forgings have been granted a license to do business in the Province of Ontario with a capital not to exceed \$40,000. Franklin W. Wegenast, of Toronto, is the company's attorney.

**The Tillsonburg Foundry & Machine Co.**, has been incorporated at Toronto, with a capital of \$25,000 to carry on business as foundrymen, machinists, etc., at Tillsonburg, Ont. Incorporators are Lydney E. Dykeman, David J. Downs and F. James Bushell all of Tillsonburg.

**Pressed Metals, Ltd.**, has been incorporated at Ottawa with a capital of \$60,000 to carry on business as engineers, foundrymen and machinists, etc., with head office at Toronto. Incorporators, J. W. Leighton, O. J. P. Crick and Y. H. Chewett all of Toronto.

**Canadian Molybdenite, Ltd.**, has been incorporated at Toronto, with a capital

of \$100,000, to acquire and develop mines and properties. Head office is at Toronto, and the provisional directors are: Franklin M. McDowell, George R. Sproat and Charles H. Kemp, all of Toronto.

## Personal

**Henry Clark**, Canadian manager for Head, Wrightson & Co., of Stockton-on-Tees, England, bridge and mining machinery manufacturers, is in England on a business trip.

**Will H. Baltzell** has been appointed chief engineer of the Canadian Steel Corporation, Ltd., with offices at Ojibway, Ont. This is the Canadian branch of the United States Steel Corporation.

**Capt. Robert Fraser**, marine superintendent of the Montreal Transportation Co., Kingston, Ont., has severed his connection with the company. Capt. Fraser will take up his residence in California.

**W. P. Kellett**, of the Dominion Steel Products Co., of Brantford, Ont., formerly engineer for the Grand Valley and L. E. & N. Railway, has been appointed to the board who are to make a valuation of Canadian Railways.

**A. S. Clarson, C.E.**, the newly appointed city engineer of Verdun, Que., has been for the past five years, principally engaged as engineer of the electrical commission of the City of Montreal. He was born in England and before coming to Canada was engaged in several important engineering works.

**O. R. Sweeny**, of Valparaiso, Chile, who is well known in ocean shipping circles, being the General Manager of the Compania Sud-Americanas de Vapores, which operates a fleet of steamers along the west coast of South America, from the Panama Canal to Patagonian ports, is visiting Toronto. Mr. Sweeny is touring the United States and Canada, accompanied by his wife. From here he goes to Montreal, Ottawa and Quebec, and then to the Pacific coast.

## Contracts Awarded

**London, Ont.**—Contracts have been let by the McClary Mfg. Co. for the erection of a galvanizing plant.

**Copper Cliff, Ont.**—The Canadian Copper Co. have awarded a contract to the Ridgeway Dynamo & Motor Co., of Ridgeway, Pa., for a motor-driven compressor.

**Montreal, Que.**—The Board of Control have awarded a contract to T. O. Sulli-

van for the construction of a bridge and headgates over the aqueduct canal at Lasalle Road. The work will cost \$209,221.

**Vancouver, B.C.**—Macdonald, Nettleton & Bruce, of Vancouver, have been awarded the contract for the construction of the C. N. R. freight sheds, their tender being approximately \$125,000. It is expected that the buildings will be completed about the beginning of next March.

## Tenders

**Toronto, Ont.**—Tenders, addressed to W. C. Wilkinson, secretary-treasurer of the Board of Education, for the Technical School, will be received until Oct. 23 for two complete chassis, one new and one used; engine with four cylinders; electric starter.

**Lyall, Man.**—Tenders will be received up till October 23 for the supply of transformers, meters, pole line construction, and electrical equipment. Plans and specifications are available at the office of the engineer of the Public Utilities Commission, 300 Tribune Building, Winnipeg.

**Hawkesbury, Ont.**—The Town Council is calling tenders for one electrically-driven turbine pump of 1,000,000 gal. per day capacity, direct connected to a 100-h.p. motor; one pump of 750,000 gal. per day capacity, with 75-h.p. motor, and for one pump of 500,000 gal. per day capacity, with 50-h.p. motor. M. Gareau is town clerk.

**Ottawa, Ont.**—Tenders, addressed to J. W. Pugsley, secretary of the Department of Railways and Canals, Ottawa, Ont., will be received up to November 15 for the construction of a reinforced concrete elevator with a capacity of 500,000 bushels. Plans, specifications and blank form of contract may be seen at the office of the following:—Chief engineer, Department of Railways and Canals, Ottawa; railways, Moncton, N.B.; general superintendent, Winnipeg, Man.; resident engineer, Fort William, Ont.; John S. Metcalf Co., engineers, Montreal, Que. Contractors who wish to obtain plans and specifications temporarily for their own use may obtain same on depositing a certified bank cheque for \$100.

**Toronto, Ont.**—Tenders will be received by Frank Barber, engineer of the Township of York, up to October 30, for the supply and delivery of the following material:—Tender A-1—for supply and delivery of approximately 20,500 ft. of 24 in. cast iron pipe; A-2—for the supply and delivery of cast iron pipe (12 in. and smaller sizes); B-1—for supply and delivery of 24 in. special castings; B-2—for supply and delivery of special

Hawkrige Brothers Company

303 Congress St., BOSTON, MASS. U.S.A.

castings, 12 in. and smaller sizes; C-1—for supply and delivery of 24 in. valves; C-2—for supply and delivery of 12 in. and 6 in. valves; C-3—for supply and delivery of air valves; D—for supply and delivery of hydrants; F—for supply and delivery of tops, covers and plugs. Plans and specifications may be obtained at the office of Frank Barber, engineer, Toronto.

## Wood-Working

**Port Hammond, B.C.**—An extension of the Hartnell Lumber Co.'s plant, which will practically double its output, is under way. One new dry kiln has already been erected, and another will be started shortly. A new boiler is being installed.

## Building Notes

**Toronto, Ont.**—A permit has been issued by the city architect to J. O'Neill for an addition to the laundry building at 2 River Street, to cost \$3,500.

**Toronto, Ont.**—A building permit has been issued to the Canada Metal Co. for the construction of a factory extension on Fraser Avenue, to cost \$20,000. Work on the foundation has already started.

## Marine

**Ottawa, Ont.**—The Canadian-built icebreaker, sold some time ago to the Russian Government, will be given a trial run at Murray Bay on the 23rd of this month. Representatives of the Russian Government are now supervising the completion of the vessel. The icebreaker was intended for the Canadian Government service and was accordingly christened the "J. D. Hazen," in honor of the Minister of Marine and Fisheries. Her new owners naturally prefer a Slavonic appellation, and she has been renamed his Imperial Russian Majesty's ship Mikula Selianinovitch.

## Catalogues

**Sand Blast.**—A leaflet illustrating and describing a sand blast machine by the Gray Manufacturing and Machine Co., Toronto.

**McGregor Swinburne, Ltd.,** Glasgow, Scotland, have mailed a series of bulletins dealing with an interesting line of chucks which are illustrated and described fully. Among these are included the "Crawford" direct drive drill chuck and slide rest chuck, full particulars of each covering the principal features being given. Other specialties dealt with

include the "Glasgow" drill and "Gyro" loose ratchet head.

**Tobin Bronze** is the title of a 36-page booklet issued by the American Brass Co., Ansonia, Conn., dealing with Tobin bronze and its application. Its physical properties are described and the results of several tests given followed by tables giving approximate weights of rods and sheets. The booklet also contains a number of testimonials from firms who have used this material for various purposes.

**Electric Portable Tools.**—The Stow Mfg. Co., Binghamton, N.Y., have issued three bulletins: No. 100, containing 20 pages, illustrating and describing electric motors; No. 101, 28 pages, on portable electric drills, grinders, motor driven screw drivers, and other electric tools; No. 102, 60 pages, illustrating the "Stow" flexible shaft, with its many applications. These bulletins are very complete and give detailed information covering the full line of "Stow" portable tools. Copies of these bulletins may be had on application.

**A Model Foundry,** is the title of a catalogue, No. 124, issued by the Whiting Foundry Equipment Co., Harvey, Ill., giving in a general way the methods followed by the company during its long experience in designing, equipping, and conducting initial operation of foundry plants for making all kinds of castings. A large number of half-tones show the different types of foundry equipment installed, including some typical crane installations and interior views of steel casting and foundry plants. A partial list of foundry plants equipped by the company in the United States and Canada is included.

**The Lagonda Manufacturing Co.,** Springfield, Ohio, are distributing their 16-page booklet, published every year or so as a general reminder and concise catalogue of all the specialties in the "Lagonda" line. The booklet which is entitled "Lagonda" Boiler Room Specialties, illustrates and describes the different types of "Lagonda" tube cleaners and other specialties, one page being devoted to each. The large catalogues are referred to for more detailed information. The booklet will be gladly sent upon request to any engineer who is interested enough to write for it.

**The McAlear Mfg. Co.,** Chicago, Ill., have issued a reference book on the McAlear system of vacuum and vapor heating, which deals with the subject in a comprehensive manner. In addition to a full description of the system, the book contains complete particulars of the various parts and their construction, method of operation and directions for installing. The illustrations include details of the traps and pumps and also

several diagrams showing various systems and applications. Copies of this book may be obtained from Arthur L. Leitch, Kent Bldg., Toronto.

**The Dearborn Chemical Co.,** Chicago, Ill., have issued a very attractive and well gotten up booklet entitled "Walter" which deals with the "Dearborn" treatment of boiler feed water. The subject is discussed under the following heads:—Corrosion, incrustation and foaming, the cause and effect in each case being dealt with in a scientific, yet practical manner. Particulars are given of the principal scale-forming solids and the reason why they are harmful, while the subject of electrolysis is also discussed. The illustrations show excellent exterior and interior views of the company's factory and offices, while the covers have a very artistic and attractive appearance. Copies of the booklet may also be obtained from the company's branch factory at Toronto.

**Burd Piston Ring Directory** for 1916 has been published by the Burd High Compression Ring Co., Rockford, Ill. This publication is a directory of piston ring sizes, which includes a tabulation of the piston ring requirements of practically every automobile of any import manufactured in the United States during the past ten years, besides information of like character covering the requirements of aeronautical, marine, stationary, and other types of internal combustion engines. The book is an invaluable source of information for garage men and those engaged in the repair of gasoline engines, and contains data on proper fitting and installation of piston rings, regardless of by whom manufactured. Stock sizes are indicated by an asterisk, which follows the telegraphic code word for every size listed. An additional telegraph code is provided, affording means of communication between the customer and the factory. This directory, while being more exhaustive than any other treatise of its kind ever attempted, is distributed among the garage trade free of charge.

## Book Review

"**Fundamentals of a Cost System for Manufacturers**" is the title of a bulletin issued by the Federal Trade Commission, Washington, D.C. This bulletin has been prepared with a view to aiding the campaign of education by explaining what a cost system is, how it operates, the results obtained, and the benefits to be derived from its operation. This bulletin shows briefly the importance of accurate manufacturing costs and the fundamental principles underlying them. Copies may be obtained from the United States Government printing office, Washington, D.C.

# Machine Shop Equipment, Methods and Processes -- II.

By E. R. Norris \*\*

*Since recent events have demonstrated so strikingly the reliance which must be placed by a nation on its engineering industry as a factor in modern warfare, the subject of the above title assumes a place of importance not previously awarded it by people in general. While not dealing specifically with munitions or other similar product, the application of the principles contained therein may be done with profit in all branches of engineering.*

**M**ACHINE tool manufacturers have shown considerable enterprise during late years in dealing with the problems and possibilities presented by the introduction of the new steel. Since greater cutting speeds, feeds and cuts were possible, it became at once apparent that machine tools of greater strength and rigidity, combined with closer speed regulation, were highly desirable. Also, since the cutting speed had been increased, the handling time became of greater relative importance; consequently, machine tools have been produced in which the leading features and improvements are rigid construction, large wearing surfaces, improved means of lubrication, superior balance—both in the parts of the machine and in the tool reaction—an increased number of available cutting speeds and feeds, closely graduated indexes, enhanced facilities for simultaneous operation and automatic and semi-automatic time-saving devices. Thus, the selection of the most suitable machine for a specific manufacturing operation has become a matter which requires considerable skill and experience.

## Machining With Edge Tools

The selection of machinery for machine shop purposes must depend not only upon the design, size, accuracy and finish required by each class of work, but also upon the quantities which may be manufactured and carried in stock at one time. The following practice, which calls for the use of parting-off machines, centering machines, special rough turning and spotting lathes, cylindric grinding machines and milling machines has been found satisfactory for the manufacture of accurately finished steel shafts, which range in size from 1½ in. dia. (38.1 mm) by 15 inches (381 mm) long to 4½ in. dia. (114.3 mm) by 5½ feet (1.68 metres) long and are manufactured in quantity.

The material from which the shafts are made is hot-rolled axle steel, which has been carefully selected under rigid inspection at the mills. It contains about 0.44 per cent. carbon and 0.55 per cent. of manganese. The ultimate tensile strength must not be greater than

90,000 pounds per square inch (6328 kg. per sq. cm.) or less than 75,000 pounds per square inch (5273 kg. per sq. cm.), and the elongation in 2 in. (50.8 mm.) must not be less than 18 per cent. The material is in about 22-foot

off machine and the internal cutting-off machine may be obtained from the following figures, which were obtained by tests made on 4.75 inch (120.65 mm) diameter by 22.5 feet (6.86 metres) long axle-steel stock.

	6 in. (152.4 mm.) Hollow-Spindle Cutting-off Machines	6 in. (152.4 mm.) Int. Cutting-off Machines.
Cutting speed .....	41.5 ft. (12.6 metres) per min.	47.6 ft. (14.5 metres) per min.
Feed per min. ....	0.25 in. (6.35 mm) per min.	2.0 in. (50.8 mm) per min.
Total time on six cuts....	1 hr., 16 min., 10 sec.	33 min.

(6.7 metres) lengths, when received from the mills, and is cut to the desired lengths after arrival at the works, these lengths being usually 1-32 inch (0.79 mm) to 1-16 (1.59 mm) longer than the finished lengths of the shafts. Several kinds of machines are used for cutting this material to lengths. The hollow-spindle cutting-off machine, with its forged steel tools, has been largely abandoned in favor of the revolving-cutter type of cutting-off machine. In the external revolving-cutter type, high-speed steel cutters, which are adjustable, are inserted in the rim of the revolving disk. The machine is provided with a very handy pneumatic clamping device by means of which the work is rigidly and rapidly fixed in position. In another machine, the cutters are arranged around an inner circumference of an annular disk. This machine is built to take stock up to 6 inches (152.4 mm.) in diameter, and the cutting is done by eight inserted high-speed steel cutters. Four of these cutters are round-nosed for roughing and four are square-nosed for finishing, so arranged that each square tool follows a round-nosed tool. The machine is driven by a constant speed motor of 710 revolutions per minute, which gives a cutting speed of 47.6 feet (14.5 metres) per minute. The length of bar stock is conveniently adjusted by means of the hand wheel, rack and gearing, one of the round ways upon which the carriage slides being graduated in feet and inches. A pneumatic clamping device, similar to the one used with the external machine, is also used with this machine. As these machines are used on rectangular and round bars, both external and internal designs are desirable, the latter being more suitable for round stock. Some idea of the relative values of the hollow-spindle cutting-

## Centering.

After the shafts have been cut to length they are next centered in a double-head centering machine, which has two self-centering chucks. By this machine, true alignment of centers is secured, and as only one setting is required for centering both ends, this method is quicker than the older method in which a single head was used. Due to rough turning operations, the centers are subject to very heavy stresses, and where the centers are not in alignment these stresses are greatly increased, the centers wear rapidly and the shaft does not run true. This renders necessary an increased allowance of metal for grinding. The centers are drilled with a combination center drill, which drills the pilot hole, counter sinks to 60 degrees and also counter bores the shaft to a depth of 1-16 inch (1.59 mm). As all shafts on one order must have their centers of uniform depth, so that length stops may be used on the lathe, the center drill is provided with a stop.

## Rough-turning Shafts for Grinding

The third operation on shafts is that of rough turning and spotting. Shafts from 1½ inch (38.1 mm) dia. by 15 inches (381 mm) long up to 4½ inches (114.3 mm) diameter by 5½ feet (1.68 metres) long may be conveniently rough turned, spotted and threaded in a special lathe. This lathe is equipped with adjustable stops for length and cross feeds, which, after the first setting, render calipering unnecessary and insure uniformity in the spotting for grinding. There are three tools, one for roughing, one for spotting and one for rough cutting the thread. Four cuts are taken with the threading tool, after which an adjustable die head, arranged over the tail-stock spindle and lathe center, cuts

\*A paper presented at the International Engineering Congress at San Francisco, 1915.

\*\*Director of Manufacturing Operations, Westinghouse Electric & Mfg. Co., East Pittsburgh.

the threads to within (0.254 mm) 0.010 inches of the finished size. The thread is brought to size by means of a hand die after all the chief operations have been performed on the shaft; this insures a true thread and corrects any abuse which the thread may have received in handling, while going through the various operations.

### Milling Keyways

The next operation is that of milling the keyways. These are milled on a heavy vertical milling machine built for work of this class and provided with a two-fluted end-mill cutter. The cutter or end-mill is held in the spindle of the machine by a draw in collet, run at a high speed and flooded with cutting compound. The shaft is located in the machine by a self-centering device and an end stop. The keyway is then cut by feeding the cutter down to a depth stop by hand, after which the longitudinal feed is used and automatically thrown out by a stop which is set to suit the length of the keyway.

If the ends of keyways are not required to fit round-ended keys, it is found economical to place a number of shafts on "V" blocks and mill them by means of gang milling cutters, which are carefully spaced on the arbor. Where keyways have been cut by this latter method and the design calls for round-ended keys, it is necessary to transfer the shafts to an end-milling machine; and experience shows that it is more economical to complete the operation on one shaft at a time on a vertical machine, because the extra handling and time taken to re-set the work for end milling more than offset the gain made by milling several keyways simultaneously.

### Grinding

The final machining operation on the shafts is that of grinding. Satisfactory grinding results can only be obtained by the use of rigid and accurately aligned grinding machines, in which the work is well supported by centers and steady rests, and where due attention has been paid to the grade of wheel, its diameter, width, peripheral speed and also speed and traverse of the work. Careful attention must also be given to the truing of the wheel, if a true and high finish is desired. The method of handling and grinding shafts depends somewhat on their size and the quantities manufactured at one time. On all heavy shafts it is the practice to rough and finish-grind complete the entire shaft before removing it from the grinding machine, except in those cases where the shaft has a taper, in which case the shaft is transferred to another machine to receive the taper grinding operation. In the grinding of heavy shafts, the fits are

first ground to size and the journals, or bearings, are rough-ground to approximately .003 inches (.076mm) larger than the finished size, the wheel is next trued up and the bearings finished. In dealing with shafts which may be easily handled by hand, the better practice is to rough-grind journals, grind the fits to size and remove shafts from the machine. After about 50 shafts have been so treated, the wheel is carefully trued up, the shafts replaced in the machine and the journals finish-ground to size.

### Milling.

Great advances are being made in milling practice as a result of recent experiments with "stream lubrication." These experiments have shown that cutter and work can be kept cool under very high speeds and feeds by the application of a sufficient quantity of cutting compound. The compound is conveniently and effectively applied to the cutter and work by means of a hood.

Some idea of the importance of "stream lubrication" may be gathered from the following data, which has been taken from various tests. By using stream lubrication while cutting the teeth of a long pinion, it was possible to increase the speed 71 per cent. and to increase the feed 164 per cent. The speed at which keyways in chrome-nickel steel shafts were milled was increased 36 per cent. and the feed 90 per cent. By the same means, the speed for milling the teeth of machinery steel sprockets was increased 86 per cent. and the feed 50 per cent.

Stream lubrication is being used to advantage in cases where, owing to limited capacity of the machine, speeds and feeds cannot be increased. The following is an instance of such a case. In milling grooves to form bars of "H" shaped section, it was possible to mill 300 pieces for each grinding of the cutter—stream lubrication being used—whereas, with the ordinary lubrication, the cutter had to be ground after 15 or 20 pieces.

While stream lubrication gives excellent results on steel of various kinds, it is not always satisfactory when used on cast iron. This appears to be the case where the hard skin of cast iron must be encountered at all parts of the traverse, as for instance where the cutter is wider than the surface of the casting, and the vertical edges of the casting skin are presented to the cutter at two places only, which are separated by a distance equal to the width of the casting.

### Continuous Milling

Since the cutting speeds and feeds have been greatly increased, it is evident that the ratio which the handling time bears to the total time of any mill-

ing operation will be greatly increased, unless improved handling and chucking facilities commensurate with the increased cutting capacity be installed. It is also evident that the highest efficiency can be obtained from operator and machine, only when the cutting proceeds continuously. This condition may be obtained, approximately, by what has been called the "continuous" method of operation. The "continuous" method may be used where the work is of such a size and shape that a circular milling attachment or a machine having two or more revolving tables can be used. Continuous milling is employed in finishing the base plates of electric sad irons by mounting them on a circular milling attachment. This circular attachment is provided with 10 independent chucks for holding the castings, thus allowing the operator time to take out the machined castings and put in other castings while the cut proceeds. The efficiency, in this example, may be gauged by the fact that the work was formerly done by one operator on two vertical milling machines fitted with transverse feed, magnetic chuck and high-speed cutters. The output was doubled and 50 per cent. of the floor space saved by the new method.

### Double Table Miller

In a comparatively recent machine for continuous milling two tables, which carry the work, revolve about a central column, the revolving and indexing being actuated by means of a foot lever. The operations of this machine are so arranged that the time for setting up the work is equal to or less than the time required to make the cut. Under these circumstances, the only lost time between cuts is 10 seconds, the time required to revolve and index the tables—to which must be added, where the work is short, the time required to traverse the work to and from the cutter at the beginning and end of each cut. As an instance of the saving effected by this machine, may be cited a case where steel keys 9 inches by 1¼ inch wide (288.6 by 31.75 mm), set up two at a time on each table, were milled on both faces in an average time of 3.45 minutes each; whereas the time required to do this work on an ordinary milling machine was 7 minutes each. By mounting 7 pieces on each table, the time per piece was reduced from 3.45 to 1.5 minutes each.

The uses of the spline miller have been extended so as to include curved slots and forms in endless variety, by an ingenious and inexpensive camming attachment. The attachment consists of an angle bracket which is bolted to the plate and carries a supporting roller for the cam. A face plate, or carriage, to which the work is attached slides on the

angle bracket, being actuated by a small roller as it travels upon the upper edge of the cam. The pressure between roller and cam is regulated by a spring. One end of the cam is fixed by a tap-bolt to the frame of the machine, the other end being supported by a roller. Straight slots may be produced by fixing the face plate to the angle bracket by means of a wing-nut and stud. This camming attachment has been found remarkably efficient for rounding off the ends of pinion teeth.

### Drills and Drilling Machinery

Although the first cost of high-speed drills is much more than that of carbon-steel drills, high-speed steel is now in general use for all drills above 3-16 inch (4.76 mm) diameter; and while carbon steels are frequently preferred for the smaller sizes where the material to be drilled is chiefly brass or cast iron, it will be found economical to use high-speed drills for the small sizes where much steel has to be drilled. There are several reasons why high-speed drills are so generally used, the first of which is undoubtedly their great cutting capacity. Carbon-steel drills are commonly used on machinery steel, with 0.005 to 0.01 inches (0.127 to 0.254 mm) feed per revolution, at a peripheral speed of 20 feet (6.09 metres) per minute, while high-speed drills are ordinary driven at a peripheral speed of 70 feet (21.33 metres) per minute, with feeds ranging from 0.010 to 0.015 inches (0.254 to 0.381 mm) per revolution; and cases are on record where, under best conditions, high speed drills have been used successfully at a peripheral speed of 135 feet (41 metres) per minute, with a feed of 0.06 inches (1.52 mm) per revolution. Another reason why high-speed drills are preferable is found in the saving of grinding time. Still another reason appears in the reduction of the number of drills carried in stock, for, owing to the frequent grindings necessary with carbon-steel drills, operators frequently carried three or four drills of the same size, so as to save the time which would otherwise be lost in walking to and from the emery wheel.

### Machine Design Revised

As in other machine tools, the adoption of high-speed steel for cutting has been followed by the re-design of the machines due regard being paid to the element of rigidity and the power required to drive new drills to the limits of their capacity. Belt-driven feeds have been largely superseded by spur-gear feeds, and cast iron gears have given place to cut steel and bronze gears. All important bearings are bushed with bronze. Spindles are of forged, high-carbon steel, accurately ground and fitted with

ball thrust-bearings, instead of the fibre washers previously used. Automatic time saving devices have received much attention. Attachable multiple-drill heads, having adjustable centers arranged to take 2, 3, 4, 5 or 6 drills, have found many suitable applications. High-speed drills have encouraged the practice of multiple-drilling, and, on repetition work, multiple drilling machines are often arranged to drill complete at one setting. The machine may be arranged for drilling in five or more directions at one time.

### WAR-TIME USES OF FOREST PRODUCTS

ONE of the mysteries of the present war, to neutrals and enemies alike, is the source from which Germany obtains the nitrocellulose necessary in the manufacture of smokeless powder, and ordinarily made from cotton. A well-defined belief exists in England that at least part of the nitrocellulose needed by German powder factories is being made from wood. "If this is true," writes A. W. Schorger, chemist of the Forest Products Laboratory at Madison, Wis., "it furnishes another instance of the surprising dependence upon wood, in one form or another, on the part of the fighting nations. The actual extent to which forest products are put to use in time of war, both for military purposes and for supplying the nation with some of the things it needs to carry on its daily life, is not generally recognized."

Warfare on land has developed in a way to give timber an importance in field operations it never had before, while the vast number of accessories needed for the smooth running of the modern fighting machine, from ammunition to absorbent cotton, have led to an extraordinary demand for certain forest products, and have even brought about new uses for wood born of necessity and unheard of a few years ago.

### Black Powder

"For one thing," Mr. Schorger says, "there is the matter of explosives. Ordinary black powders contain about 75 parts saltpetre, 10 parts sulphur, and 15 parts charcoal. The charcoal employed must possess special properties, and is made largely from dogwood, willow and alder. In spite of the advent of smokeless powder, enormous quantities of black powder are still used. It is employed in shrapnel, for which only a moderately powerful explosive is required to drive the bullets. Besides, the smoke produced when the shell explodes is an actual advantage in enabling the gunners to determine the correct range.

Black powder is also used to fill the rings of the time fuses with which shrapnel shells are equipped, for which purpose no satisfactory substitute has yet

been found. Furthermore, it is used in most armor-piercing shells, which should attain a great penetration before they go off, and for which the majority of high explosives would be unsuitable because of their explosiveness on contact. Another product of the forest, resin, is employed for filling the spaces between bullets in shrapnel, so that on explosion the missiles will be evenly distributed in all directions. Its brittleness, and at the same time its hardness, together with its low melting point, fit it admirably for the purpose.

### Nitrocellulose

The period since the beginning of the war has witnessed a great amount of discussion in England as to whether Germany is actually employing wood from which to make the nitrocellulose for her smokeless explosives. When after a long delay England declared cotton contraband of war, it was maintained by many that this would not inconvenience Germany greatly, since she was already making explosives from wood cellulose. During the discussions that followed it was proposed to destroy the forests of Germany by a giant fleet of aeroplanes armed with bombs; however, as one English editor naively remarks: "This would scarcely be feasible, since about one-third of Germany is forested."

"As a matter of fact, little or no reliable information exists in regard to Germany's use of wood for nitrocellulose, and expert opinion in England differs widely about the matter. Sir William Ramsey believes that such explosives are being made, and Walter F. Reid, who introduced the important gelatinization process in the manufacture of smokeless powder, is emphatic that a nitrocellulose can be made from wood pulp that is equal in every respect to that made from cotton. On the other hand, Clayton Beadle, whose opinion is entitled to great respect, holds that the difficulties attending proper purification of the wood cellulose previous to nitri-fication are all but insurmountable.

"However, this may be, records published by German scientists before the war show that a high explosive can be manufactured from wood cellulose, though at that time its stability was questionable. While it required forty years of experiment to render guncotton stable, anything like the same time might not be necessary in the case of wood cellulose, for the experience with guncotton should facilitate solution of the present problem. It is highly probable that the chemical difficulties have already been overcome."

### Turpentine and Rosin

The long leaf pine forests of the South furnish 90 per cent. of the world's supply of turpentine and rosin. In normal times turpentine is used mainly as a solvent in the arts. According to Mr.

Schonger, it is entirely possible, however, should the need arise, to make from turpentine a synthetic camphor as good for practical purposes as the natural product. In the event of the blockade of the Pacific Coast this should be the means of preserving our celluloid industry, which now consumes the greater part of the 5,000,000 pounds of Japanese camphor imported annually.

Rosin, the use of which in shrapnel has already been mentioned, is employed mainly in the manufacture of cheap soaps and as a size for paper. So acute has become the scarcity of rosin in Germany that the Prussian Minister of Agriculture has suggested such measures for increasing the supply within the empire as distilling resinous wood and collecting the oleoresin which exudes from trees peeled by deer. Prices being paid for rosin by the Central Powers are almost fabulous. Curiously enough, a substitute for paper size recently proposed by a German scientist has wood tar as its base.

### MEETING WAR EXIGENCIES.

THAT Germany is not the only belligerent country that has devised new means of meeting the exigencies of war is shown in a report from the American Consul, at Bradford, England, who says that English manufacturers have found many ways of providing articles made extremely scarce because of war demands. Artificial leather, a good substitute for leather; artificial silk, various fuel oils, wood pulp for many uses to which cotton was formerly supposed to be alone suited, and new means of recovering rubber from waste rubber goods are some of the extensively developed materials and processes.

Scientific research and invention have been most active in Great Britain since the war began, the consul says, and many substitutes have been found for articles hitherto regarded as practically indispensable. Many of the imported aniline dyes have been supplanted by home-made dyes that were formerly entirely neglected. The production of alcohol from wood pulp has started up and wood pulp is also being employed in silk weaving where before cotton was used. The British are now beginning to make kerosene engines to take the place of gasoline engines, and there is a considerable use of benzol in lieu of gasoline.

One of the interesting substitutes is artificial leather. Linen duck is coated with varnish, to which is added a small quantity of siccativ and Venetian red. Several layers of the dried linen are then joined together in sheets of varying thickness. The adhesive mixture used for this purpose consists of four parts of heated wood tar pitch, with the

addition, during constant stirring, of two parts of India rubber dissolved in benzol, four parts of Venetian red, mixed to a thick consistency, with French turpentine oil and two parts of cork powder. Sheets thus prepared are compressed between powerful rollers. The product, it is claimed, serves as an excellent substitute for leather, especially for the soles of footwear. It can be easily sewn and pegged, and can replace leather in many of its uses.

### THE MUNITIONS PROBLEM

ACCORDING to the *London Iron and Coal Trades Review*, experiences in America have brought forth the conservative estimate that it would take fifty engineers, designers and draughtsmen at least one year to prepare the drawings for the seventeen sizes of shell now used by the United States army, together with drawings for gauges, jigs, fixtures and tools. To produce the latter would take 800 men, well trained and in well-organized factories, at least five years, calculating 300 working days per year. This, it is estimated, would find employment for 100 factories, each employing 2,000 men, capable of producing a total output of 200,000 shells per day. Twice this number of shells have been used in a single day in the present war by one of the combatants. It was found in America that it would take at least 300 first-class gauge makers six months to furnish the first working set, inspector's set and the master's set necessary for rifles in quantity, and when 1,000 rifles per day are required it means that the working sets must be increased from one to ten, and the inspector's set from one to five, keeping the master's set for reference purposes. It is believed that in the United States there are not more than 3,000 expert gauge makers. Tool-making, jigs, fixtures, etc., require a small army. It is calculated that it takes at least 1,000 toolmakers one year to furnish tools for an output of 1,000 rifles a day, and it may be estimated that to put 1,000,000 men in the field requires from 2,000,000 to 3,000,000 rifles.

### SCARCITY OF WOOD PULP

THE News-Print Manufacturers' Association reports that the pulp wood situation in Canada is ominous. Mills which were paying \$18 and \$26 a month, with board, to ordinary workmen in the woods last year, are now competing with one another for an adequate supply, and are offering from \$55 to \$60 a month with board, and camps in many cases are not supplied with a full complement of men. There is every probability that the cost of pulp wood will advance very sharply this year as compared with the pulp wood costs of the past, but the chief

source of worry will not be the high cost of pulp wood, but the possibility that the mills may not be able to secure a sufficient supply to provide for their requirements during the whole of the year 1917. Statistics showing the production and shipments follow:

Production, Shipments, Stocks,			
Week ending	p.e.	p.e.	tons.
Sept. 16...	102.2	104.7	1,323
Sept. 23...	83.2	83.4	1,376
Sept. 30...	106.2	107.6	1,181

The heavy decrease in production and shipments for the week ended September 23 was largely caused by labor trouble at a large Western mill, and by the fact that a number of the smaller mills were running on other grades of paper. The report for the Canadian territory follows:

Production, Shipments, Stocks,			
Week ending	p.e.	p.e.	tons.
Sept. 16...	99.5	105.4	8,090
Sept. 23...	96.3	100.8	2,405
Sept. 30...	95.6	90.9	2,852

### BIG DEVELOPMENT IN SHIPPING SERVICES

ACCORDING to a news agency telegram from Glasgow, Scotland, it is stated in well-informed circles there that important negotiations are taking place with a view to a big development of shipping services between the Old Country and Canada. A "regrouping" of the shipping companies is probable, and will, it is stated, "affect the C. P. R., the Allan, the C. N. R., and the Cunard lines."

Early in this month it was pointed out in the *London Times* that the Anchor Line was understood to have acquired an interest in the passenger ships of the Donaldson Line, which trades to Canada, and it would seem likely that this development has given rise to the present report. The interest in this transaction was enhanced by the fact that the Cunard Company holds a controlling interest in the Anchor Line, and that a few months previously the Cunard had concluded a far-reaching agreement with the C. N. R., and had acquired the vessels owned and controlled by that company.

The C. P. R. now owns the Allan Line, the vessels of the two companies being managed by the Canadian Pacific Ocean Services (Limited), and the White Star Line is associated with the Dominion Line as being joint subsidiaries of the International Mercantile Marine Co. of New Jersey. The passenger lines in the Canadian trades may, therefore, be separated into three principal groups, as follows:—Canadian Pacific and Allan Line; White Star and Dominion; Cunard, Anchor, Canadian Northern and Donaldson.

The Cunard has gradually been extending its trade with Canada since it acquired the Thomson Line in 1911.

and Ideas Evolved from Actual Practical Application and Experience

## METHODS OF MEASUREMENT FOR EXPERT MECHANICS—II.

By F. Scriber

**A**T THE beginning of the previous article attention was drawn to the possibility of error resulting from the dimensioning of a drawing being done in one way and the actual measuring of the piece being done in another way. To prevent loss of time and remove any possibility of error on the part of the shop, dimensions should always be put on a drawing in the same way as the piece will be measured.

For certain purposes of calculation it may be necessary to put on a dimension which cannot be measured in the shop, and, where a high degree of accuracy is required, dimensions which are quite impracticable are frequently employed as shown by Fig. 15.

### Impracticable Dimensions

These dimensions are usually the

result of a draftsman having a fixed point on a layout from which to work, coupled with the fact that when detailing

FIG. 17.—UPPER: LOCATING THREE HOLES BY DISCS. LOWER: LOCATING EQUALLY SPACED HOLES BY SAME METHOD.

the parts the dimensions are given from this point without regard to the fact that this point is "out in the air," and cannot be used to measure from. Referring to Fig. 16, the illustrations are

shown with the proper dimensions from which all measurements may be taken from within the part itself, thus permitting the work to be checked after laying

as in Fig. 15, than if dimensioned as in Fig. 16, where all measurements may be made in a vertical or horizontal plane by holding a plug in the radius E. The view

FIG. 15.—METHOD OF DIMENSIONING WORK WHICH DOES NOT PER MIT OF CONVENIENT MEASUREMENT

out as well as facilitating the work of laying out. These two plans of working dimensions differ chiefly from the fact that in Fig. 16 construction holes X are used from which the various locations are obtained, while in Fig. 15 it is not possible to take scale measurements in many cases. Referring to Fig. 15, locating plate, it is obvious the slot A cannot

of the test plate, Fig. 15, is a good example of dimension lines given from "nowhere," as the centre line F cannot be used to measure from with instruments and the centres G and H are out in the air and cannot be used; therefore, if good work is expected some other form of measuring must be resorted to, and the method shown by Fig. 16, with con-

FIG. 16.—A MORE DIRECT WAY OF DIMENSIONING THE WORK SHOWN IN FIG. 15.

be located accurately from the point B, thus the method of locating in Fig. 16, with dimensions C and D is the better way. Likewise the radius E, Fig. 15, is less likely to be correct if dimensioned

construction hole X, provides an accurate method of measuring this piece.

### Applying the Disc Method to Boring

The disc method of laying out work

for boring is now quite generally understood, and is illustrated in Fig. 17, upper view, where, having radius A, B and C, it is desired to determine the diameters

$$C = \frac{1}{2} \text{ angle, } X = B - A$$

$$X = \frac{2A \times \sin C}{1 - \sin C} \text{ or } \frac{2B \times \sin C}{1 + \sin C}$$

FIG. 19.—TWO METHODS OF MAKING ACCURATE ANGULAR MEASUREMENTS.

of discs which, when touching each other, give the desired centre distance. This is obtained by using two discs D and E whose radii equal A when by supplement-

FIG. 18. UPPER: LOCATING THREE HOLES BY THE BUTTON METHOD. LOWER: LOCATING HOLES RADIALLY BY THE USE OF BUTTONS.

ing these discs with a third disc F, of a diameter which will make the radii B and C, the centres are accurately located. The

diameters of discs are found by the following formula: A—B equals difference between radii of discs E and F. Adding this difference to C, we obtain diameter of disc E, E÷2 equals G. A—G equals H, and likewise D—B equals J.

In the lower view, Fig. 17, is illustrated a disc method of laying out a number of equally spaced holes, which is easily applied and consists of a number of discs A in contact with a central disc B, and in contact with each other, these discs to be of such a diameter as will bring the centres of the small discs on the radius C. The radius of these discs is found by dividing twice the number of discs or spaces into 360 degrees, which gives the angle D. Having hypotenuse C and angle D using formula— $C \times \cotan \text{ of angle } D = E$ —the radius of disc A is obtained, and subtracting this from radius C gives radius of disc B.

The disc method does very well for small precision work; while for work of large radius the button method, Fig. 18, is used, which is an adaptation of the disc method, using adjustable buttons in place of discs, and setting these buttons

per view, Fig. 18, the hole A is first located using dimensions B, following which holes C and D are located using dimensions E, F, G and H, and measur-

FIG. 20. LEFT: COMMERCIAL SINE PROTRACTOR ON BASE. RIGHT: ANGLE IRON AND SWIVEL TABLE FOR SETTING WORK ON.

ing between the buttons in a vertical or horizontal plane instead of to centres as the dimensions are given. The vertical and horizontal measurements are preferable to the angle X and radius Y on this class of work to insure accuracy. The method of locating centres shown by the lower view, Fig. 18, is obvious, as square figures A and B are given in preference to radial C and angular D.

### The Sine Protractor

As in an article of this type, which is intended to be suggestive, it is not desirable to go deep into the actual method

FIG. 21. ARRANGEMENT OF PARTS TO BE ACCURATELY ASSEMBLED.

the correct distance apart with the aid of a vernier height gauge or other suitable measuring instrument. In the up-

per view, Fig. 18, the hole A is first located using dimensions B, following which holes C and D are located using dimensions E, F, G and H, and measur-

onometry, upon which the solutions of these problems depend, or can obtain this information from a handbook. In line with this intention note is made of the use of sine protractors for measur-

FIG. 22.—UPPER MEASURING THREE GROOVES WITH PLUGS LOWER: LOCATING SLIDE FROM HOLE BY SAME METHOD.

ing angles, as illustrated in Fig. 19, upper view, with the formula there given for figuring. In the lower view is a formula showing the method of using discs in contact to measure or set up a given angle, this method being in general use, and having been described in some of the late mechanical handbooks.

To illustrate the principle on which sine protractors work, reference is made

illustrated in Fig. 21, which also shows the making of dovetail measurements by the use of plugs. In the upper view at the left is shown a bracket, and into this bracket are fitted two slides, as shown at the right upper view. This bracket with the slides is to be accurately located on the base shown in the lower view. To accomplish this result a construction hole A is placed in the bracket, being located from the finished surfaces made *f*, as indicated by the lines B and C. With these finished surfaces the two dovetailed grooves are measured by means of the dimensions D and E. The two slides are also measured by means of plugs using dimensions F and G. Again making use of the construction hole A, the bracket is located in position on the base, using the dimensions H and J. Following this, the holes in slide X are accurately located from the construction hole, thus assuring a good job, any part of which may be duplicated by actual measurements without recourse to the common method of fitting the parts together each time any part is made.

#### Groove Set-up

A set-up used for measuring grooves is illustrated by Fig. 22, upper view. The method of procedure in this case is obvious, as the depth of grooves is first measured, as indicated at A, following which plugs B are set in the grooves and measurements are taken, as indicated by the dimension lines. In the lower view, Fig. 22, it is necessary to locate the dovetail slide in relation to the hole, and this is accomplished by testing with standard plugs D between a plug E held in the angle of slide on one side; measuring

ness of detail which these set-ups show, and it often happens that some simpler and quickened method can be applied which is satisfactory. This, however, is a matter which calls for individual judgment, and no amount of descriptive methods can cover the numerous departures from these examples which will suggest themselves to the wide awake tool-maker.

#### INCREASING PRODUCTION

By S. M.

IN the belief of many managers the productive capacity of their shops are limited if their equipment does not happen to be of the very latest type. Their machines may have done good service in days gone by, yet because they are slightly antiquated, the feeling prevails that operations must be performed in the same old time-killing manner. When high speed steel became a reality and an acknowledged success, many superintendents failed to see the advantages accruing from its use. The writer has in mind one such shop which uses at the present time only a very few high speed drills. Although a large bulk of replacements are made with drills of the high speed variety, yet the management cannot see the advantage of discarding the old drills and putting in an entirely new stock, which would prove in a short time an exceedingly profitable investment.

As matters now stand, a compromise is made on feeds and speeds by the operators with a consequent lowering of efficiency. In fact, many of the users of drills about the shop are unacquainted with the use of high speed drills, due to the small number used, and they consequently know but one speed. No

FIG. 1. SPECIAL TOOLING ON ENGINE LATHE FOR BORING AIR COOLED ENGINE CYLINDERS.

FIG. 2. BORING ENGINE CYLINDER COMPLETE AT ONE OPERATION.

to Fig. 20, which shows at the left a commercial sine protractor mounted on a base, with buttons whose difference in height from base is measured to obtain the angle. At the right, Fig. 20, is shown a convenient angle iron and a swivel table for setting up work at an angle while measuring or machining.

Quite an interesting application of measuring from a construction hole is

between the two plugs in the angles across F indicates whether the width at dovetail is correct.

From these illustrations it is hoped some idea of how to execute various jobs may be obtained when a high degree of accuracy is necessary, but it might be well to bear in mind that much of the work commonly met with in the shop does not require attention to the minute-

doubt in many other manufacturing institutions the same problem exists, especially those of the smaller variety, and which have been in operation for several years. However, where such conditions prevail, it is possible by a proper study of the conditions to sufficiently add to the equipment as to make a decided improvement in the results obtained. Sometimes it is possible

by the addition of very simple fixtures to materially increase the production of any tool. One of the principal differences between the machine tools of today and those of several years ago lies in the fact that the numerous changes of tools are eliminated. Of course, the machines themselves are made considerably heavier, enabling heavier cuts to be taken, but, leaving this consideration aside, the main feature lies in the elimination of unproductive movements on the part of the operator.

The object of this article is to point out one or two instances of increased production as applied to the engine lathe. In any machine shop the most used machine tool is the lathe, and that on which the greater part of the operations are performed. Fig. 1 shows the operation of boring and facing air-cooled cylinders used on small gasoline engines. The original method of doing this job had been to chuck the piece and bore it out with the ordinary boring tool, after which it was reamed, using the tail stock for feeding the reamer through the piece. While it was not possible to do this job on a turret lathe, an effort was made to reproduce conditions there existing, and the same was done with a remarkable degree of success, as evidenced by the increased production. A heavy bridge was placed on the carriage, being dowelled in position and then bored out to receive a boring bar, this bar being also guided by a bushing in the spindle. A fixture was also made for the spindle to which the cylinders were bolted after first being faced on that end. The boring heads were made a loose fit on the bar and were driven by a pin through same. When one cut was taken through the cylinder, the carriage was run back and

the end of the bar, this being tapered to receive it, the final reaming cut being run by hand. The end of the cylinder was faced, using the cross slide, the tool post having been removed in the cut.

In Fig. 2 is shown a different type of cylinder, which was also used on a gasoline engine. In this case the cylinder was fastened directly to the carriage; the boring bar being made sufficiently long so that the three cutter heads could be slipped on one end of the bar. One of the heads was then held to the bar by a pin, and after this cut was taken, the cutter was loosened and the second one run through. When the cylinder was finished the three cutter heads were at the tail stock end of the bar. By placing the heads all on the bar it was unnecessary to remove the bar until the cylinder was entirely completed. In this particular case a balanced drive was also used on the bar.

In Fig. 3 is shown the small amount of equipment which was used to increase the production of piston rings. The cut shows a ring casting or pot being turned both inside and outside, as well as being made eccentric at the same time. The only equipment in this case was a flat plate, the boring bar, and the inside tool holder, costing in the neighborhood of \$15 or \$20. This equipment saved something like \$350 in the first year of its use over the previous method which had been in operation for a considerable length of time.

In Fig. 4 it was desired to do boring and facing at the same time, and to accomplish this end a power feed was arranged at the tail stock end for a boring bar. A bicycle sprocket was placed just inside the hand-wheel, and could be rigidly connected to same by merely slipping through a pin. Roughing and finishing cutters were provided for the bar for the different jobs. It will be noticed that by this method the carriage is left entirely independent of the bar. The above instances are merely given

to show what can be accomplished along the lines first mentioned, and while they apply to but one type of machine tool, yet they are representative of what may be worked out in almost any small shop, and, with the proper amount of attention given to the equipment, there is no

FIG. 3. EQUIPMENT WHICH INCREASED PRODUCTION OF PISTON RINGS.

FIG. 4. TAILSTOCK WITH POWER FEED FOR BORING WHILE FACING IN THE REGULAR WAY.

one head removed by hand and another slipped on. The operation of changing heads practically occupied no more time than that of indexing a turret. After the roughing cuts were taken through the cylinder, the reamer was slipped on

through a pin. Roughing and finishing cutters were provided for the bar for the different jobs. It will be noticed that by this method the carriage is left entirely independent of the bar. The above instances are merely given

doubt but what greater efficiency may be obtained in the majority of cases. As competition is very keen along any of these lines, it behooves the manufacturer to take advantage of every opportunity of increasing his production; and consequently lowering the cost of same.

## SQUARING A SMALL DIE

By J. H.

IN the making of small dies for sheet metal work, it is sometimes desirable to have a small square that will permit the blade to enter the opening. It is sometimes difficult to use a flat-bladed square, owing to the inconvenience experienced in gauging the various faces of the die. A very simple, yet serviceable device is

SQUARING A SMALL DIE.

shown in the accompanying sketch, where A is a flat block of cast iron and B a small piece of stub steel driven into a hole in the centre of the block. This short piece of steel is first carefully squared with a small try-square and when the die is placed on the block with the steel pin in the opening, all faces can be accurately gauged with very little trouble. Where the die is very small, marking the steel pin is often an advantage.

## MACHINISTS' INSTRUCTION COURSE—VIII.

TO be able to correctly turn a shaft the right size for a working or running fit, or bore out a wheel or brush a running fit, with the aid of calipers only, depends entirely upon the skill and judgment of the workman. While the following rules are by no means a perfect guide under all circumstances, they have been found to give general satisfaction and will no doubt prove of value to many. The following table shows the amount one leg of the inside calipers should swing inside the hole, when the other leg is resting on the side for a running fit.

Dia. of hole Inches	Swing of Calipers Inches
1-2	$\frac{1}{4}$
2-3	$\frac{3}{8}$
3-4	$\frac{1}{2}$
4-6	$\frac{5}{8}$
6-8	1
8-10	$1\frac{1}{8}$
10-12	$1\frac{1}{4}$
12-15	$1\frac{1}{2}$
15-18	$1\frac{3}{4}$
18-22	$1\frac{7}{8}$
22-26	$2\frac{1}{4}$
26-30	$2\frac{1}{2}$
30-34	2
34-38	$2\frac{1}{4}$
38-42	$2\frac{1}{2}$
42-46	$2\frac{3}{4}$
46-50	3
50-54	$3\frac{1}{4}$
54-58	$3\frac{1}{2}$
58-62	$3\frac{3}{4}$
62-66	4
66-70	$4\frac{1}{4}$

### Driving Fits

The allowance for driving fits depends upon a number of circumstances such as the length of the hole, as in a long hole there is more bearing surface than a short hole, consequently the outside diameter of the driven piece can be made a little less. The diameter of the work, the smoothness of the surface, the nature of the metal, and the thickness to resist bursting must all be taken into consideration, so that it is impossible to lay down definite rules. It is in this class of work that experience counts. Generally speaking, if the hole and the shaft are made exactly the same size up to about 6 ft. you will have a pretty snug driving fit. Always oil the surfaces, as it may happen that the fit is a little too tight and if you want to take it out to ease it a little after you have been driving two dry surfaces together, it may give you a lot of trouble.

### Making a Forced Fit

The allowance for forced fits is a lit-

tle more than for driving fits, the main things to take into consideration being the same as have just been mentioned for driving fits. One firm of engine builders allow for forcing on crank pins, one-quarter of a thousandth for every inch in diameter up to 8 in. In

a great extent the choice of one or other of the methods depends upon the work in hand. The first method is by setting over the tail stock spindle or dead centre out of line with the live centre. There are usually graduations on the back of the tailstock with a zero mark

$\frac{1}{2}$ " TAPER IN 6 INCHES

FIG. 31.

fitting car wheels and axles it is generally specified that they shall go together with a certain pressure from 20 to 30 tons. Most firms specify exactly the amount to be allowed on their particular class of work; a 20 to 30-ton fit on a wheel and axle requires an allowance of about .008 in.

In calipering shafts or axles, the amount of difference is not always measured, a snap or limit gauge being sometimes used, or the calipers may be set—the insides to the exact size of the hole, and the outsides to the exact size of the insides, then by letting the outside drag over the work a fairly accurate estimate can be made of the force required to make the fit according to the length of the drag on the outsides.

### Shrink Fits

A shrink fit refers to the method of putting two pieces together, usually by heating the metal around the hole, thereby causing it to expand, then putting the piece it is to be shrunk on to through the hole, and allowing it to cool and contract on to the axle or shaft, or whatever it may be. A good rule is to allow .003 in. for the first inch and  $1\frac{1}{2}$  thousandths more for every inch up to 20 in. diameter.

66"	" " " " "	.070

### Taper Work

There are at least three different ways of turning taper work between the centres of a lathe. Each method has its advantages and disadvantages, while to

indicating when the lathe is cutting parallel. If there are no graduations or reference marks, make one with a fine chisel, then the amount that the tailstock is set over can be measured with a scale.

In order to use this method it is necessary to figure out the amount of taper per ft., or per inch, whichever is the most convenient, and compare it with the length of the job, or else assume that the work is one continuous taper from end to end. Suppose, for example, we had a taper to turn according to sketch, Fig. 31. Here the taper is  $\frac{1}{2}$  in. in 6 inches, or 1 inch per ft., but the total length of the job is 3 ft. and if we assumed the taper was continuous from end to end of the job, we should have 1 inch taper per ft. for 3 ft., which would be 3 inches of taper, or that we should have to set the tailstock over  $1\frac{1}{2}$  in., which is half the amount, because, when the tool cuts into the work, say,  $\frac{1}{4}$  in., it makes the job  $\frac{1}{2}$  in. less in diameter, because you take  $\frac{1}{4}$  in. off each side. Setting over the tailstock is most convenient when the job is a long one and the taper is slight.

### Objections to Tailstock

The objection to setting over the tailstock is, that the centres are not in line, therefore they wear unequal and uneven, and the part that is taper is very apt not to run true with the part that is parallel. If a number of pieces of different lengths were to be turned the same taper, the lathe would have to be reset for each piece; and even if they were the same length, if the centers were not all drilled to the same depth it would make an appreciable difference. Another way in which the

lathe may be set for turning taper, is to turn a small portion at one end of the taper to the small size, and another portion at the other end of the taper to the large size. Then run the tool backward and forward between the narrow strips that are turned, and adjust the centres until the tool exactly touches both ends, in the same manner as has already been described in testing the lathe for turning parallel. This method is equally adaptable for setting over the tailstock or the compound rest. Tapers can be turned by hand by swinging round the top slide of the compound rest. This is the best method for short, abrupt tapers, and it would greatly facilitate matters for the lathe hand if draughtsmen would give tapers in degrees and state amount per ft. in addition to giving dimensions; then the lathe hand would have nothing to do but put his rest round to the degrees indicated on the drawing.

The following table of tapers and angles will be found useful in connection with lathe work:

Taper per ft. Inches	Angle with Centre Line Degrees	Minutes
1/16	0	18
3/16	0	27
1/4	0	36
5/16	0	45
3/8	0	53
7/16	1	02
1/2	1	11
9/16	1	21
5/8	1	30
11/16	1	39
3/4	1	47
13/16	1	56
7/8	2	06
1 1/16	2	14
1 1/8	2	23
1 1/4	2	50
1 1/2	3	34
1 3/4	4	10
2	4	46
2 1/2	5	57
3	7	08
3 1/2	8	18
4	9	27
4 1/2	10	37
5	11	46
6	14	03

If measured with micrometers, the allowance below standard for running fits up to 6 in. is as follows:

Dia. of hole Inches	Allowance Inches
1/16	.0015
1/8	.002
1/4	.0025
3/8	.00325
1/2	.004
5/8	.005
3/4	.006

### READER'S QUERY SOLUTIONS

ON page 392 of October 12 issue appeared a reader's query, by F. L. L., for the finding of the values of  $x$  and  $y$ , in the equation  $A = B \times x \times y$ , where  $A$  and  $B$  are known quantities, and the ratio of  $x$  to  $y$  is as  $3\frac{1}{2}$  to  $2\frac{1}{4}$ .

From the equation  $A = B \times x \times y$  we obtain  $x \times y = \frac{A}{B}$ ; therefore, as  $A$  and  $B$

are known, and the value of  $x$  and  $y$  are relatively known, a factor common to  $x$  and  $y$  must be found to solve the

equation. Let this unknown factor be represented by  $Z$ , and as an example let  $A = 100$  and  $B = 10$ ; then using the relative values of  $x$  and  $y$ , the equation will be  $A = B \times xz \times yz$ , and transpos-

ing we obtain  $xz \times yz = \frac{A}{B}$ , or

$Z^2 = \frac{A}{B \times x \times y}$ ; then by using the various values, we have

$$Z^2 = \frac{100}{10 \times 3.5 \times 2.25} = \frac{1}{.7875} = 1.2698$$

$$Z = \sqrt{1.2698} = 1.1267.$$

As this is the factor common to both the relative values of  $x$  and  $y$ , the actual values of these terms will be  
 $xZ = x \times 1.1267 = 3.5 \times 1.1267 = 3.94$  for  $x$ , and  
 $yZ = y \times 1.1267 = 2.25 \times 1.1267 = 2.54$  for  $y$ .

To prove the equation with these values we have  $A = B \times x \times y = 10 \times 3.94 \times 2.54 = 100.076$ . This value is a little large owing to the cutting off of several decimal places. The solution is, however, obtainable by using the relative values of  $x$  and  $y$  as known quantities, and solving for an unknown factor, common to both, that will alter their values, and still retain the desired ratio.

J. R.

IN a recent issue, F. L. L. addressed a query regarding the value of  $x$  and  $y$  in a given equation.

The solution which is quite simple is as follows:—

$$\frac{7x}{2} = \frac{9y}{4} \quad \frac{9 \times 2}{4 \times 7} = \frac{18}{28} = \frac{9}{14}$$

$$y = \frac{9}{14}x = -x = -x$$

The given equation will thus give us the value of  $x$  in terms all of which are known.

$$A = B \times x \times y = B \times x \times -x$$

$$14A = 9Bx^2$$

$$x^2 = \frac{14A}{9B}$$

$$x = \sqrt{\frac{14A}{9B}}$$

and as  $y$  is  $-\frac{9}{14}x$ ,  $y = -\sqrt{\frac{14A}{9B}}$

To verify this, let us suppose that  $A = 5040$  and  $B = 10$ .

$$\text{Then } x = \sqrt{\frac{14 \times 5040}{9 \times 10}} = \sqrt{784} = 28$$

$$\text{and } y = -\frac{9}{14} \text{ of } 28 = 18$$

Thus,  $5040 = 10 \times 28 \times 18$ , which is a verification of the equation

$$A = B \times x \times y.$$

A. M.

REPLYING to query by F. L. L. in issue of Oct. 12, the following solution is submitted:—

$$A = B \times x \times y.$$

Ratio of  $x$  to  $y = 3\frac{1}{2}$  to  $2\frac{1}{4}$ .

$$x : y :: 14 : 9$$

$$x = \frac{14}{9}y \text{ (a).}$$

$$\text{and } y = -x \text{ (b).}$$

By substituting (a), we have

$$A = B \times \frac{14}{9}y \times y$$

$$9A = B \times 14y^2$$

$$y^2 = \frac{9A}{14B}$$

$$y = \sqrt{\frac{9A}{14B}}$$

In case (b) we have

$$A = B \times x \times -x$$

$$14A = B \times 9x^2$$

$$x^2 = \frac{14A}{9B}$$

$$x = \sqrt{\frac{14A}{9B}}$$

$$y = -\sqrt{\frac{14A}{9B}}$$

To prove the foregoing:—

Assume  $A = 1260$  and  $B = 10$ . Then

$$\text{Then } A = 10 \times 14 \times 9 = 1260$$

$$(a) \quad y = \sqrt{\frac{9 \times 1260}{14 \times 10}} = \sqrt{\frac{11340}{140}} = \sqrt{81} = 9$$

$$(b) \quad x = \sqrt{\frac{14 \times 1260}{9 \times 10}} = \sqrt{\frac{17640}{90}} = \sqrt{196} = 14$$

W. G.

Editorial note: The solutions submitted by A. M. and W. G. are obviously correct, the introduction of an additional factor by J. R. being an unnecessary complication.

THE vertical belt drive has always been a sort of hoodoo, and perhaps always will be. About the only way such a drive can be run satisfactorily without keeping the belt "drum-string-tight" is by the aid of an idler, and—how some men preach against idlers. Personally, I am not opposed to idlers where they are necessary. They don't consume much power if properly designed, aligned, oiled and kept clean. It has been proved in actual tests that idlers of this type consume so little power that the loss isn't even traceable.—N. C. N.

# The Development of Irregular Sheet Metal Pipe Connections

## Staff Article

*The problems dealt with in this article are typical examples encountered in actual practice, which, while not of very frequent occurrence, may be of considerable importance when met with. They possess considerable divergence from ordinary symmetrical forms and a study of the methods employed will enable them to be successfully applied in practice.*

### CONNECTING UPRIGHT MAIN TO TWO VERTICAL BRANCHES

By R. Hamilton.

A PIPE connection is required to unite two branches to the main supply pipe; all three pipes of circular cross section and in a vertical position. The main pipe is 4 feet in diameter, the two branches 1 foot 6 inches in diameter, with one side of the connection perpendicular with the base or large opening, and the projection of the pipes—as shown in the top view—tangent to one another, the altitude of the connection being 4 feet.

neeting the three circles, and also the centre line representing the joint between the two halves of the connection, each of which are similar, but formed in the opposite directions. To obtain the front elevation, draw the base line  $ab$  and project the various points from the top view, cutting this base line and also the top line, which is drawn parallel to  $ab$  and at a height equal to the altitude of the piece; that is 4 feet. To the right of the front elevation, with a radius of 2 feet, and the point  $I$  as a centre, draw the semicircle  $4'f10'$  and divide it into six equal parts; from these points erect

tween the two connections. From the points  $1^1$ ,  $12^1$ ,  $11^1$  on the centre line  $mn$  in the front elevation draw the horizontal projecting lines cutting corresponding radial lines in the side elevation as shown. Through these points draw the curved line  $10^1$ ,  $11^1$ ,  $12^1$ ,  $1^1$ ,  $2^1$ ,  $3^1$ ,  $4^1$ .

### True Length of Construction Lines

Before proceeding with the development of the pattern, it is necessary to obtain the true length of both the radial lines and the diagonal lines. The radial lines are those connecting similar points of division on the upper and lower surfaces, and the diagonal lines are those connecting opposite ends of adjacent radial lines; for instance, the line joining the point  $9^1$  on the base line with the point  $10$  on the top line is termed a diagonal line, etc. To obtain the true length of a line that is at an oblique angle to both the horizontal and vertical planes, proceed as follows:—By using the projection to a vertical line, of a line in the elevation, as one leg of a right triangle, and the length of the line as represented in the plan or top view, as the other leg, the hypotenuse of such a triangle will be the true length of the line. Therefore, to obtain the true lengths of the radial lines for the development of the pattern, erect the vertical line  $xy$  as shown at  $D$ , the point  $(y)$  being on the base line and the point  $(x)$  on the projection of the top surface. With the exception of the lines that intersect the centre line  $mn$ , it is evident that the vertical leg of the right triangle will equal the length of the line  $4$ ,  $4'$ , as shown by the horizontal projection. The various lengths of the horizontal legs are obtained from the top view; thus, the distance  $y6$  in  $D$  equals the length of the line,  $6$ ,  $6'$  in the top view; the line  $y7$  in  $D$  equals the line  $7$ ,  $7'$  in  $C$ ; the line  $y5$  in  $D$  equals the line  $5$ ,  $5'$  in  $C$ , etc. For those lines falling on the centre line  $mn$ , the vertical leg of the right triangle is obtained by projecting the points  $1^1$ ,  $2^1$ ,  $3^1$ ,  $11^1$ ,  $12^1$  in  $B$  to the vertical line  $xy$ , the horizontal leg being derived as previously stated, with the exception that the length is taken from the top circle to the centre line  $mn$ .

The true length of the diagonal lines is obtained in the same manner, the vertical leg of the triangle being the same, and the horizontal leg being the length of the line in the top view, passing from a certain division on the base circle to the adjacent division on the top surface.

DEVELOPMENT OF CONNECTION BETWEEN UPRIGHT MAIN AND TWO VERTICAL BRANCHES.

This problem with the accompanying solution illustrates an interesting example in triangular development. To obtain the three principal views necessary for the desired solution, proceed as follows:—First erect the perpendicular centre line  $mn$ , and from the point  $O$  describe a circle having a diameter of 4 feet; tangent to this circle at the point  $4$  draw the horizontal line  $44'$ . At a distance below this line, equal to the radius of the small branch pipe, draw the two horizontal lines  $ce$  and  $ce$ . With  $O$  as a centre and a radius equal to the radii of the large and small pipe, describe arcs cutting the lines  $ce$  at the point  $(e)$ ; with  $(e)$  as a centre, describe a circle representing the opening of the two branches, one on either side of the large circle. The top view can be completed by drawing the tangent lines con-

perpendicular lines cutting the base line as shown. From the point  $4'$  draw the vertical  $4'4$ , cutting the top line at the point  $4$ ; with  $4$  as a centre and with a radius equal to the radius of the small pipe, describe an arc cutting the top line at the point  $I$ ; with the same radius and the point  $I$  as a centre describe the semicircle  $4g10$ . Divide this semicircle into six equal parts, projecting the points down cutting the top line as shown. Now, from corresponding divisions in the large and small circles, in the top view, and also those in the front and side elevations, draw lines as shown. For instance, in the top view connect the points  $1$ ,  $2$ ,  $3$ , etc., in the smaller circle with the points  $1^1$ ,  $2^1$ ,  $3^1$ , etc., in the large circle; likewise in both elevations.

In the side elevation it is necessary to obtain the true shape of the opening be-

For instance, the distance y9 in E equals the length of the line 9<sup>1</sup>, 10 in C, etc. The true lengths of the diagonal lines that intersect the radial lines cutting the centre line mn are found similar to that already described.

### Pattern Development

To lay out the development on a flat surface, a start can be made from any point, but as a matter of convenience we will start with the line 4<sup>1</sup>, 4, this being the only line whose true length is shown in the elevation. To distinguish the radial lines from the diagonal lines, the former are shown as a series of long dashes, while the diagonal lines are represented by long dashes, with two short dashes intervening. First draw the line 4<sup>1</sup>, 4 in F equal to the corresponding line in the front elevation, then with 4 as a centre and the length 3, 4 in E as radius, describe the arc 3, 3 in F. With 4<sup>1</sup> as a centre and the distance 3<sup>1</sup>, 4<sup>1</sup> on the irregular curve in B as a radius cut the arc 3, 3 in F at the point 3<sup>1</sup>. Then with 3<sup>1</sup> as centre and 3, 3 in D as radius describe the arc x, x, and with 4 as a centre and one of the divisions on the small circle in the top view as a radius, cut the arc x, x in F at the point 3. The completion of the development can be easily understood from the above explanation, care being exercised in following the method described. Remember that when using the points 1, 2, 3, 4, etc., as centres, the radii will be the diagonal lines as found in E, and the distances represented by the divisions on the smaller or top circle. When using the points 1<sup>1</sup>, 2<sup>1</sup>, 3<sup>1</sup>, 4<sup>1</sup>, etc., as centres, the radii will be the radial lines as found in D, or the distances represented by the divisions on the larger base circle, or that shown on the irregular curve in B.

The foregoing constitutes the reply to a reader's query.

## Questions and Answers

**Question.**—When referring to machine screws, etc., what is meant by an included angle of 82 degrees?

INCLUDED ANGLE ON HEAD OF SET SCREW

**Answer.**—The included angle is the number of degrees contained within the angle formed by the opposite edges of the bevel portion of the head, as shown in the sketch. This angle is recognized as the standard for machine screws.

**Question.**—When fitting corrugating rolls, should the two rolls fit each other?

**Answer.**—Flat rolls should fit the entire length, unless they are small in diameter in proportion to their length, when it is sometimes advisable to leave them a little high in the centre to allow for the spring. When fitting forming

SHOWING AMOUNT OF SPACE LEFT BETWEEN CORRUGATING ROLLS.

rolls with an odd-shaped contour, the thickness of stock must be allowed for, to insure perfect operation. Neglecting the question of spring in the metal being worked (which is often an essential factor in the harder metals), the space (S) in the sketch, when measured at right angle to the surface, should equal the thickness of the stock. This can be more clearly shown in the sketches (B) and (C), where certain portions of the stock in the latter are at right angle to the axis of the shafts.

**Question.**—The foundation for a large machine is to be built of concrete to a depth of 7 feet; the base of the machine measures 18 x 11 feet. If the concrete extends for 6 inches on all sides and the bottom dimensions are 21 x 14 feet, what will be the volume in cubic yards, and the weight of the concrete, the specific gravity being 4.8?

**Answer.**—The volume can be calculated from the formula,

$$\text{Volume} = D \times \frac{A \times 4 \text{ m}}{6} \text{ when}$$

D equals the depth of the prism.

A equals the sum of the areas of the top and bottom.

m equals the area of a section taken parallel with and midway between the top and bottom surfaces.

Top area equals  $19 \times 12$ , or 228 square feet.

Bottom area equals  $21 \times 14$ , or 294 square feet.

Middle sectional area equals  $20 \times 13$ , or 260 square feet. Then from the

$$\text{formula, volume} = 7 \times \frac{522 \times 4 \times 260}{6} =$$

1,822 cubic feet, or 67.48 cubic yards.

With a specific gravity of 4.8, the total weight will be  $62.5 \times 4.8 \times 1,822$  equals 546,600 lbs., or 273 tons.

**Question.**—When a train is going around a curve, do the outer or inner wheels slip to make up for the difference in length of the outer and inner rails?

**Answer.**—Just what action takes place when a train is passing around a curve is very difficult to determine, as several elements or forces are combined to effect the change in the train's direction. Some authorities claim that a certain percentage of slip takes place in obtaining the objective, while others contend that the higher elevation of the outer rail causes the force of gravity to draw the load to the lower level, thus effecting the desired change. While the above conditions are undoubtedly true to a large extent, one of the factors that has a great bearing on the question appears to be the tendency of the outer wheel to climb the outside rail. As shown in the sketch, the pair of wheels that are rigidly secured to the one axle, must make the same number of revolutions in travelling a certain distance; but the shape of the wheel profile is such that in rounding a curve the flange of the outer wheel is forced against the rail, the fillet caus-

ILLUSTRATING ACTION OF WHEELS GOING ROUND A CURVE.

ing the wheel to raise, so that the parallel motion that takes place on a straight track is changed to that of the frustum of a cone rolling on a flat surface, an exaggerated condition of which is shown in the lower sketch. Therefore, it is through the united efforts of the combined forces that the change is brought about.

## AUTOMATIC TRIPLE ACTING NON-RETURN VALVE FOR BOILERS.

**N**ON-RETURN valves prevent the backward flow of steam into the boilers from the header in case of a rupture. The added emergency feature shown in the cuts also prevents an outward rush of steam should a break occur in the main steam line or branches. In a battery

ing valve, which communicates with the space between the two dashpots, being piped to the pilot valve which also connects with the outlet side of the valve or header.

The header pressure being on top of the piston of the pilot valve and the boiler pressure underneath, the weighted pilot valve piston, according to weight adjustment supplies the variation on which the triple acting valve will operate in case of a burst steam line beyond the valves. When a break occurs in the steam main or branches, the pressure is instantly removed from above the pilot valve piston and the full boiler pressure being underneath, unseats the piston, allowing the pressure between the dashpots of the triple acting valve to escape. The triple acting valve will immediately close, and the full boiler pressure still coming through the by-pass of the valve disc on top of dashpot A holds the valve to its seat, cutting off the flow of steam from the boilers.

Thorough cushioning of such valves is vitally necessary to eliminate disastrous hammering or pounding, and the Double Corliss Dash Pot arrangement, occupying the full area of the upper portion of the body, insures smooth, economic and reliable operation: holds the valve disc in perfect alignment with the seat, and makes the valve practically indestructible due to service. In the closure of the valves the double cushioned feature allows a quick drop to within  $\frac{1}{8}$  in. of the seat, then the valve closes easily under the control of the secondary dashpot. By turning the handwheel, the stem may be run down on top of the valve disc, thus making a permanent closure of the valve.

The triple acting valve may be closed or tested at any time independent of the pilot valve by having a small branch line run to any convenient point with a small hand valve attached, as illustrated. Upon opening the small valve and allowing the exhaust of pressure from between the dashpots of the triple acting valve, the latter will close—thus providing for all contingencies and insuring absolute safety in the

operation of the plant. An automatic valve should be tested automatically to prove it operative to close in event of accident.

There is no adjustment to be made in the triple acting valve. The automatic pilot valve can be quickly set for any variation of pressure by simply adding or removing shot or other weight from the hollow piston for greater or less variation between the

LONGITUDINAL SECTION AUTOMATIC TRIPLE-ACTING NON-RETURN VALVE.

equipped with these valves the outflow from every boiler is stopped if anything happens to the header or main piping.

The sectional view shows the inside dash pot A attached to the valve disc, while the outside dashpot B acts as a cylinder, which is held firmly in place by cap bolts. The valve disc has a central port with a ball valve at the top and through this port full boiler pressure reaches the entire space above the liner and underneath the inside dashpot at C, therefore, it is balanced. A pipe connection is made to the exhaust port in the side of the triple act-

PART CROSS SECTION THROUGH AUTOMATIC TRIPLE-ACTING NON-RETURN VALVE.

boiler and header pressure. The boiler and header pressure can drop together from say 175 to 50 pounds without operating the valves, but, the instant the variation of pressure reaches that for which the automatic pilot valve is set, the valves will operate quickly—which is the only time you want them to operate. The Golden-Anderson Valve Specialty Co., Pittsburgh, Pa., are the manufacturers of the foregoing.

## COMBINATION THREADING AND CUTTING-OFF MACHINE

THE machine shown is one of a line of pipe and nipple machines developed

by the Oster Manufacturing Co., of Cleveland, Ohio, to meet the demand for a pipe machine that would perform every one of the many pipe threading jobs ordinarily required, using pieces long or short, straight or bent, over or under size, nipples of any length, and all-thread nipples.

The illustration shows the 300-B machine for  $\frac{1}{4}$  to 2-inch pipe. It is operated by a  $\frac{3}{4}$  h.p., direct or alternating current, Westinghouse motor, the motor being mounted on the machine base, direct connected, with ample power and speed for all classes of work.

The machine illustrated is a combination threading and cutting-off machine, a combination pipe, nipple and bolt machine. It will thread bolts from 7-16 to 11 $\frac{1}{4}$  inches. The regular standard equipment consists of motor, geared oil pump, automatic cut-off apparatus, automatic die release, and four sets of right hand pipe dies from  $\frac{1}{4}$  to 2 inches. The special features are the lever operated die head and the open type pipe vise, which makes the machine a rapid producer. The dies are automatically oiled and the operator can see the work of threading at all times.

One advantage of the machine is the open type vise which enables the operator to change the work quickly and thereby increase the capacity. Every

die head for threading short pieces, short bends, nipples, bolts, and casings.

The quick die release feature of the machine makes possible the opening of the dies at the instant the thread is finished. It opens the dies gradually and removes the burr, leaving a clean, perfect thread. At the same time, the vise carrying the pipe is thrown back, withdrawing the pipe from die head. This contributes to faster and more perfect work, and insures duplication of the length of the thread. When adjusted for the length to be cut, it will repeat automatically without any attention on the part of the operator. One set of dies will thread two or more sizes. They are made of a high-grade carbon steel carefully tempered, and are controlled by a lever, being opened or closed by

one movement of the hand while the machine is in motion. The lever is fastened to the die arm and is used in releasing the dies when the thread is cut, in setting them to same size for making duplicate threads, in changing the dies from one size to another, and in setting them to graduation on the face plates. When the thread is finished it is only necessary to trip the die lever, and this opens the dies right off the work, without making it necessary to stop the machine.

For threading close nipples the machine may be equipped with two-threaded nipple holders, which are attached to the front of the regular jaws by two bolts. The threaded end of the nipple is held in these holders while cutting a thread on the other end. When the thread is cut, the vise jaws are opened by the half turn of the hand wheel and the nipple drops out. The cutting-off

that no belt or chains are necessary to drive it. It is connected direct to the gears of the machine and operates constantly while the machine is in motion,

IMPROVED STACKING TOTE BOX.

thus insuring a steady and constant flow of oil to the dies. It is a combination pump and works both ways, for right and left hand threading. The oil is contained in a reservoir within the base of the machine. The pump lifts the oil from the reservoir and floods the dies and cutters, when the oil is returned to the reservoir through a strainer.

#### IMPROVED STACKING TOTE BOX.

AN improved stacking tote box is being marketed by the New Britain Machine Co., New Britain, Conn., and in its construction are embodied several features which are designed to eliminate the faults heretofore found in boxes of this type in general.

The box is made from No. 16 gauge steel and electrically welded throughout, no rivets whatever being used. Handles are of No. 14 gauge stock, folded double and punched to afford hook hold for dragging box along the floor. The size adopted, 20 in. by 12 in. by 6 in. is considered best for average requirements, being in length and capacity about the limit for comfortable one-man handling.

The sides slope inward just enough to provide support for the box above and are folded on to the ends. The deviation of the sides from square, however, is so small that rectangular work can be packed in as conveniently as irregular pieces. A  $\frac{3}{4}$  in. selvage around the edge of the box greatly increases its stiffness. The ends extend one inch above the sides and are folded over on to the selvaged edge of sides where the lat-

MOTOR DRIVEN THREADING AND CUTTING OFF MACHINE FOR ONE-QUARTER INCH TO TWO-INCH PIPE.

operating part is right under the hand so that not a moment is wasted. The vise grips the work by a single turn of the wheel, bringing it to an absolute centre, and can be moved up close to the

apparatus operates automatically by means of a pawl attached to the frame of the machine, a ratchet attachment automatically regulating the feed of the cutter. The oil pump is so arranged

ter lap on to the ends. These raised ends are bent outward sufficient to permit box above to slip between.

Spot welded to the bottom and slightly shorter than the box are two half-round runners. These are carefully beveled on ends and so placed that, when box is in stacking position, they are in contact with edges of box below, thus opposing any tendency of sides to spring in under heavy weights. The upper corners of ends are cut off at a 45° angle, and embossed pieces are spot welded to lower corners of ends parallel with the upper corners and in such position as to act as guides in bringing box to stacking position. These guides in conjunction with the runners also serve to prevent any sidewise shifting of boxes while being trucked. As indicating the security of the stacking feature, a stack of ten boxes can be tilted to an angle of almost 45° before buckling.

built by the Reliance Machine Co., Toronto, to meet the demand for machines of this type.

The frame of the machine is a single casting with bed, legs, headstock and bearings integral. The spindle is of semi-steel and is formed with a 15 in. dia. flange which carries a collet type chuck (not shown). The front bearing is 8½ in. dia. by 12 in. long, being large enough to allow a 6 in. shell to enter the spindle. The dia. of the spindle at the drive gear is 9½ in., the gear being 4½ in. wide, and 3 diametral pitch. The two step cone pulley has diameters of 15 in. and 18 in., and a ball thrust bearing is provided at the rear end of the spindle.

The turret is 20 in. dia., and has six 3 in. holes for bars, each hole having a keyway on the bottom side, while two set screws on top serve to hold the bars securely in position. A spigot is pro-

## CANADA'S ANNUAL TRADE EXCEEDS 1½ BILLION DOLLARS

AGGREGATE Canadian trade, exclusive of coin and bullion, for the twelve months ending with July, totalled \$1,587,933,707, as against \$919,178,659 for the corresponding period ending with July, 1915. This is an increase of \$668,755,048.

Imports of merchandize totalled \$622,886,350, an increase of more than \$200,000,000 as compared with the total for the twelve months ending July, 1915. Exports of merchandize totalled \$965,047,457, as against \$499,872,322, an increase of \$460,000,000. The balance of trade in favor of exports during the calendar year was more than \$340,000,000.

The total duty collected during the twelve months was \$121,906,788, as against \$78,787,427 for the twelve months ending with July, 1915, an increase of about forty millions. The average ad valorem rate of duty on duti-

FRONT VIEW OF SHELL BORING MACHINE WITH INTEGRAL FRAME CASTING.

REAR VIEW SHOWING HEADSTOCK GEARING WITH COVERS REMOVED.

In dragging boxes over the floor the runners present only line friction and remove wear and tear from bottom of box. As a result of this feature, the "New Britain" Stacking Box lends itself to storage in racks because it will slip into and out of rack with great ease. Owing to this small bearing surface and the firmness of the stacking feature, it has been found that a stack of five or six loaded boxes can be dragged along the floor with remarkably slight effort.

By reason of the raised ends generous space is provided above the handle for card holder in which position it more readily indicates contents of box and is less liable to become soiled.

### SHELL BORING MACHINE

THE rapid and accurate performance of the boring operation on large shells, calls for machine tools which are amply capable of doing heavy duty work, and the Hare Boring Machine, shown in the photograph herewith, and which takes any size shell up to 8 in., has been

vided on the outside diameter of the turret to remove any possibility of tipping, and the center stem has a hole through which boring bars may be knocked out from behind. A hardened steel locking ring and pawl locate the turret in the various positions.

Carriage is 42 in. long with the power feed applied through a steel rack 3 in. wide located centrally on the underside of the carriage. A tripping pawl on the side of the carriage disengages the power feed at any desired point. Four feeds from 1-32 in. to ¼ in. are controlled through levers on front of machine, ball bearings being provided for all thrusts throughout the feeding mechanism.

All gears are completely guarded in use, and equipment includes countershaft with pulleys, oil pump, pans, piping and wrenches. As equipped for 6 in. shells, the machine weighs 8,000 lbs.

The Dominion Royal Commission concluded its session in Toronto on Oct. 19. and is now sitting in Ottawa.

able goods for the twelve months was 34.44. On all goods imported the average rate of duty was 19.45 per cent.

### FRENCH SYNDICATE SEEK PAPER PLANT

A SYNDICATE of Parisian newspaper publishers is seeking the purchase of the \$1,000,000 paper-making plant of the Donnacona Paper Company, which has been in operation two years. It has a valuable waterpower, some 6,000 horsepower of which has been developed, and holds timber lands said to aggregate 228,000 acres. The total output on November 1 will be 100 tons of newsprint daily.

The syndicate endeavored recently to purchase the Remington Paper & Power Company's property in New York State, but was outbid by Sears-Roebuck interests. While the production of the Canadian plant is not so great as that of the Remington company, its location is considered more satisfactory to the French buyers.

### THE DECIMAL SYSTEM IN CURRENCY, WEIGHTS AND MEASURES

THE present-day tendency, aside from the war effects, is towards standardization, it being clearly evident that the latter makes for efficiency; notwithstanding, to the war and the trade relationships which will prevail as its result will the most pronounced progress towards standardization be traceable. In a word, there are practically certain to be created universally accepted decimal systems of currency, weights and measures in business transactions. Even in Great Britain, where exists the triple antithesis to the decimal system, and where the propriety of adopting the new methods of reckoning has been many times discussed and as often flouted, public opinion is being stirred to action and ripened to the point of ultimate adoption. What is Britain's concern in this matter is also that of Canada, for while we boast a decimal currency we are like her involved in the weights and measures feature. Again, the good and substantial reasons why Britain's manufacturing and commercial interests judge a change to be essential are applicable in every respect to us.

It is contended that we have reached the parting of the ways, in a word the time has come when the decimal system in its entirety must be adopted if we would both secure a footing and maintain it when the anticipated trade war follows the bloody struggle in Europe. We have been parties to the Allies' Conference and have, so to speak, committed ourselves to certain lines of action when peace is declared, one anticipated result being, of course, the derivation of trade benefits and closer commercial ties with our partners in the meantime struggle. As an indication of the importance attaching to this feature, it may be noted that France, Belgium, Serbia, Portugal, Roumania and Italy have each adopted the metric system, and together with Russia and Japan, they have the decimal system of currency.

Opposition and quite strenuous opposition to the change is to be expected, and is indeed far from inactive. The opposition, however, relies less on adduced reasons than on innate, stubborn conservatism and distaste of change, however necessary or desirable be the latter. A wound to

national pride would be involved in the nationalization of a decimal system, it is said, on a par with which was the one-time neglect by Britishers of the acquirement of foreign languages, the reason being that if business was wanted to be done, the foreigner should transact it in the English language. The latter attitude, even preceding the war, had happily largely disappeared, yet we are not altogether sure but that a few dregs still remain, as an illustration of which antagonism to the recent and successfully operated Daylight Saving Act in Great Britain amply demonstrates. Not a few people refused to alter their watches, although the official time had been changed and as a consequence of their fight for independence of action, they subjected themselves to no end of inconvenience. The Daylight Saving Act as far as Great Britain was concerned brought untold benefit in a myriad directions, yet it meant a cross to many or was assumed as such because a disturber of their work-a-day existence.

Opposition to national progress and development of the nature indicated is usually as numerically weak as it is trivial, and may be reckoned so relative to the national establishment of decimal systems of currency, weights and measures. It is realized that Germany's success in foreign markets was due in large measure to her appropriation of the decimal system, and it is further realized that with the advent of peace and the resumption of national, commercial intercourse, she will still have that advantage unless Britain and her Colonies do business by like direct standards. Canadian industry and commerce may be said to be equally involved with Britain in this matter of the wholesale adoption of the decimal system of reckoning. We are anticipating and preparing for a footing in the markets of the world, and while our currency is no encumbrance the same cannot be said of our weights and measures which are British. In addition to the Allied Nations already referred to in detail as having in operation the decimal system, neutral nations, including the South American and Latin-American Republics, Holland, Norway, Switzerland, Sweden and Spain are also so provided.

Little heed, if any, has been given to the decimal system need in our projected capture of a share of world markets, judging at least from public pronouncements on the subject. We are of opinion, however, that our business interests will not only find it advantageous to follow Britain's lead in the matter, but will unhesitatingly and unanimously lend active support in establishing in its entirety a decimal system of Empire trading. The *Liverpool Journal of Commerce*, speaking of our weights and measures, says: "Who offhand has any appreciation of the relation of the ounce to the ton or of the foot to the mile? Which of us knows how many square feet make a square mile, or is familiar with the basis of calculation adopted by the bricklayer or the carpenter in roofing a house, for instance, or a land agent in estimating the area of an estate? How many cubic inches constitute a cubic yard, and how does the pint stand in respect to the gallon? We live, in fact, in an arithmetical setting with which few of us are at home, in spite of all the efforts of the elementary schoolmaster. Many opponents of change would, we suspect, reveal under cross-examination that they know little of the so-called systems which they defend. Our tables happen to be British and insular, and therefore we rather like them, but it cannot be said that they have much else to recommend them."

## INDUSTRIAL NOTABILITIES

**L**LOYD HARRIS, of Harris, Cook & Co., financial agents, Brantford, Ont.; vice-president, Canada Starch Co.; director, Willys-Overland Co. of Canada; director, Trusts and Guarantee Co.; president, Russell Motor Car Co.; director, Dominion Power & Transmission Co.; director, Steel Company of Canada, Ltd.; president, Canada Glue Co.; managing director, Underfeed Stoker Co. of America, Chicago; vice-president, Canada Cycle & Motor Co., was born at Beamsville, Ont., March 14, 1867, son of John and Jane (Tufford) Harris. He was educated at the Public Schools, Brantford, the Collegiate Institute, and at Woodstock College.

LLOYD HARRIS

He began his business career in the service of A. Harris, Son & Co.; went to Europe in the interests of his firm in 1889; became resident manager in Great Britain, with head office in London, and upon the formation of the Massey-Harris Co. he returned to Canada in 1900, since which time he has devoted his whole time and attention to private interests.

Mr. Harris is a member of the Military Hospitals Commissions; represented Brantford in House of Commons, 1908-1911; member of Brantford City Council, 1905-1906; president, Brantford Board of Trade, 1902-1903; vice-president, Canadian Manufacturers' Association, 1905; director, Ontario Motor League; president, Brantford Lacrosse Club. He was presented to the late King Edward VII., Windsor Castle, in June, 1905; received appointment as Hon. Lieut.-Col. 25th Brant Dragoons, 1909; resigned 1912.

Mr. Harris married Mary Perkins, daughter of James Perkins, Petrolea, Ont., 1887 (deceased 1892); secondly, Evelyn Francis Blackmore, daughter of Capt. William Blackmore, Penzance, England, March 10, 1897; has one daughter. His clubs are Brantford, York, National, Toronto, R.C.Y.C. (all of Toronto); Rideau and Country (Ottawa); Sports (London, Eng.); Hamilton, Tamhaac (Hamilton), and Caledon Mountain Trout Club. His societies are A.F. & A.M., and his recreations motoring, tennis and bowling. In politics he is a Liberal, and in religion Anglican. His residence is 110 Brant Avenue, Brantford, Ontario.

piling up so rapidly, that deliveries are being extended into the first quarter of 1918. With the mills so crowded with munitions orders, domestic requirements have to be curtailed. Steel for munitions purposes is none too plentiful, and many shell makers are experiencing difficulty in filling their contracts, although reports seem to indicate a little relief in this direction. The demand for billets and sheet bars is extremely heavy, and all mills are pressed to the utmost in their effort to meet the consumers' needs. An advance of \$5 per ton is quoted on the East Pittsburgh price of forging billets, the quotation at maker's mill being now \$75 per ton. No abatement marks the demand for plates, car builders and shipyards being the most persistent inquirers. That a general advance in the price of sheets may be anticipated is indicated by the recent advance of from \$3 to \$5 on the products of the American Sheet & Tin Plate Co. The revised prices are for first half of 1917 delivery. An advance of \$5 per ton is reported on the New York price of steel bars.

The expected advance on wire products has partly materialized, \$2 being added to the Pittsburgh price of nails and barbed wire; the former being now quoted at \$2.70; painted barb at \$2.85, and galvanized at \$3.55 per hundred pounds. The discount on wire fence (carload) is now 59 per cent., instead of 60. While nothing has been done in local circles regarding the advance in prices, dealers are considering a revision of their present quotations. The only changes reported are on galvanized sheets, Queen's Head having declined 25¢ per hundred, the current quotation being \$7.50. Fleur-de-Lis, quoted at \$7.25, shows a decline of 10¢ per hundred.

**Metals**

No developments have taken place to change the general quiet tone of the market, which has again resumed its steady position, following the temporary scare of the past two weeks. Copper is firm and strong. Tin is gradually resuming the position held before the recent excitement. Spelter is inactive, but comparatively firm. Lead is very firm, with a stronger undertone. Antimony is fairly active, with quotations strong. Aluminum is quieter.

**Copper.**—While the general situation continues to retain its extremely strong position, the market is comparatively quiet, and unless something unforeseen should happen to change existing conditions, it is likely to remain so for some time to come. The fact that the majority of consumers are well covered for present and near future requirements tends to inactivity on the open market, although small sales are being quietly made, and while the purchase price is

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

**Montreal, Oct. 23, 1916.**—Industrial conditions in every part of the Dominion indicate that relaxation of manufacturing and commercial activity is neither present nor near future imminent. The continual advance in price quotations of all classes of commodities gives no indication of an early cessation of current demands. The contemplated strike of C. P. R. trainmen does not tend to improve the present strained business situation, a railroad tie-up at this time being highly undesirable from every aspect. The labor problem is apparently not so acute meantime, owing to the increased employment of women workers in many of our munition plants.

**Pig Iron**

Increased activity has featured the pig iron situation, and the condition of the market is reflected in the general advance on all grades of American produce. This advance ranges from \$1 to \$2 per ton; certain grades of low phosphorus pig show an increase of \$4 per ton. The demand for steel-making pig is greater than the furnaces can supply.

**Steel**

The ever-ascending prices of raw and semi-finished materials appear to be the serial feature of the present abnormal steel situation. The demands upon the mills are so incessant, and the orders

reported to be slightly below the prices quoted, these sales are not likely to affect the general market conditions. Dealers are careful in closing contracts for metal, owing to the uncertainty of obtaining supplies. Producers are so filled with orders that they are not taking any active part in the present market, being content to leave the situation in the hands of the dealers until such times as further developments should take place. The British market remains very firm, with London quoting a 20-shilling advance on spot and a thirty-shilling on futures, the current price of spot copper being £124 per ton. The New York market is strong and very firm, with quotations on lake and electrolytic unchanged at 28½¢ and 28¾¢ per pound respectively; casting is ¼¢ higher at 27¾¢ per pound. The local situation is unchanged, with prices firm at 31¢ for lake and electrolytic, and 30¢ for casting.

**Tin.**—The scare due to the near activity of submarines, which created such excitement a couple of weeks ago, has practically disappeared, and conditions are again about normal. Pronounced activity is not, however, apparent, although sufficient business is passing to maintain tin in its present strong position. The London market has become a little easier, as indicated in a decline of approximately 20 shillings on this week's quotations. New York has recovered from its last nervous spell, this being reflected in a further decline of ½¢ in this week's quotation, the nominal price being now 41¢ per pound. Local dealers report a fairly active market, with quotations at 45¢, an advance of ½¢ per pound.

**Spelter.**—While sufficient buying is taking place to prevent the market taking on a stagnant appear-

ance the activity is not such as to break the general dullness. However, there appears the possibility that improvement may soon be realized. Now that consumers are showing increased interest in the market, with sellers of metal not anxious to dispose of it at present low prices, a return to higher quotations is not unlikely. With refined spelter on the decline and the cost of ore maintained, producers are not inclined to sell metal at existing prices, believing that the market will shortly return to a position where a profit is possible. London reports a forty shilling decline on spot, and futures are slightly easier. New York has fluctuated during the week, the present quotation being ⅓ cent lower than last week; the nominal price being now slightly below 10¢ per pound. No change is noted in local conditions and dealers are reporting spelter as firm at 13¢ per pound.

**Lead.**—The situation is apparently so sound that any excess demand at the present time would result in higher prices. The supply of metal does not overlap the consumption to any great extent, and producers are well sold for several months ahead. Additional buying developments would therefore create a stronger market, subsequently boosting the price of the metal. However, should business be placed for first quarter delivery, it is possible that a considerable volume would be accepted at current prices. The London situation is very steady, while New York retains its strong position, quotations being 7¢ "Trust" with independents quoting ⅓¢ higher. The situation here is unchanged with prices strong and firm at 9¢ per pound.

**Antimony.**—The strong tone of the New York market has been maintained by the continued demand for metal from Canadian consumers. The placing of additional munitions orders is responsible for the increased purchasing, and the condition of the market is reflected in present quotations, which at 13¼¢ is an advance of ½¢ over last week. Dealers here report an active market, with prices firm at 15¢ per pound.

**Aluminum.**—The recent activity has subsided and the market has returned to position of a few weeks back. The situation is still very strong, but prices are again becoming easier, New York reporting a decline of one cent on No. 1 Virgin and 2¢ on pure remelt, quotations being 66¢ and 61¢ respectively. Dealers here report a slightly easier market, but prices are firm and unchanged at 70¢ per pound.

#### Machine Tools and Supplies

While the greater volume of present business is in munition making machinery these is in evidence a very encouraging demand for domestic equipment, much of which is due to the activity that Canadian manufacturers are displaying in the possibilities that recent foreign made exhibits have opened up for them. Already many lines of product, hitherto confined to other parts of the world, are being carefully considered with a view to manufacturing and inquiries for suitable machinery indicate that action is likely to result. Owing to the introduction of female help into various lines of industry, the labor question is less acute and additional equipment, necessary for maximum production, is now being installed.

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

#### BRAZIL

Rio de Janeiro, British Consul General.

#### CHILE

Valparaiso, British Consul General.

#### COLOMBIA

Bagota, British Consul General.

#### ECUADOR

Quito, British Consul General.  
Guayaquil, British Consul.

#### EGYPT

Alexandria, British Consul General.

#### FRANCE

Havre, British Consul General.  
Marseilles, British Consul General.

#### INDIA

Calcutta, Director General of Commercial Intelligence.

#### ITALY

Genoa, British Consul General.  
Milan, British Consul.

#### MEXICO

Mexico, British Consul General.

#### NETHERLANDS

Amsterdam, British Consul.

#### PANAMA

Colon, British Consul.  
Panama, British Vice-Consul.

#### PERU

Lima, British Vice-Consul.

#### PORTUGAL

Lisbon, British Consul.

#### RUSSIA

Moscow, British Consul General.  
Petrograd, British Consul.  
Vladivostok, British Consul.  
Odessa, British Consul General.

#### SPAIN

Barcelona, British Consul General.  
Madrid, British Consul.

#### SWEDEN

Stockholm, British Consul.

#### SWITZERLAND

Geneva, British Consul.

#### URUGUAY

Monte Video, British Vice-Consul.

#### VENEZUELA

Caracas, British Vice-Consul.

Delivery of the heavier type of munition lathes is still backward. With few exceptions, shipment of standard tools has become almost normal. That further advances can be expected in the price of supplies is generally conceded, due to the continual advance in the cost of raw materials. Price lists are constantly being revised to meet the higher costs of production, and under the uncertain conditions that now prevail, it is not unlikely that still higher prices will rule in the future.

### Scrap

The market in old materials is still retaining its strong position in conjunction with the condition of the steel and metal markets. The recent heavy sales of copper for export purposes has caused this scrap to be in good demand and prices have advanced accordingly. While some dealers have followed the market, others have been inclined to retain their old prices. The majority however are now convinced that existing conditions will prevail for some time, and this week's quotations show an advance of from 10 to 15 per cent. over that of the past few weeks; quotations range upon 19 cents for light to 23 cents for heavy and crucible scrap. Machine compositions are now 18½ cents, with turnings quoted at 15 cents. Brass clippings are now 15 cents and turnings 13 cents; being an advance of 1¼ and ¾ cents respectively. Wrought iron pipe scrap has advanced ¼ cent, and is now quoted at 10½ cents. Heavy and tea lead are ½ cent higher, being quoted at 6½ and 5½ cents respectively.

**Toronto, Ont., Oct. 24.**—An event of interest to Canadian manufacturers is the exhibition of enemy samples which is being held in Convocation Hall Building in this city. While a number of these samples are of very inferior grade and hardly worth consideration, there are others which might be copied with advantage and manufactured in Canada for sale in foreign markets as well as in this country. The exhibition is being held under the auspices of the Department of Trade and Commerce, Ottawa.

The freight congestion at the local terminals has again assumed serious proportions. Owing to the accumulation of freight in the yards awaiting delivery in the city, the railway companies have been compelled to refuse to accept from outside points consignments bound for Toronto of less than car lots. This embargo is naturally causing considerable delay and loss to local merchants. Shortage of labor, the railway officials say, is responsible for the congestion which has been more or less in evidence all this year.

### Steel

The belief that there will be no im-

provement in the steel situation for at least eighteen months, if not longer, seems to be generally accepted. The mills are in a sold-up condition, and the demand shows no indication of falling off. The steel required for munitions alone will aggregate an enormous tonnage, while the amount of steel used for other purposes will be even greater. The revival in shipbuilding caused by the serious shortage of tonnage has already been partly responsible for what is practically a famine in steel plates, while steel rails are badly wanted, but cannot be obtained in sufficient quantities to satisfy the demand. With such conditions prevailing, prices will continue to advance, and the mills get further behind on deliveries. There are no changes to note this week in bars, sheets, tubes or plates, but wire nails have advanced 15c, and are now quoted at \$3.95 per keg, with every possibility of the \$4 mark being reached in the near future. Wire products have also advanced 15c per 100 pounds. Mills report the demand for locomotive and merchant tubes very

### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

heavy, some makers being sold up for practically eight months. The plate situation is getting tighter, prices being very firm and deliveries running into the second and third quarter of 1917.

A slight decline in prices of galvanized sheets has been announced this week, but it is hardly likely that the new price will remain in effect very long, as the tendency is decidedly in an upward direction. Higher prices on black sheets, particularly the lighter gauges, are expected shortly, in which case galvanized sheets would be affected, as spelter has been holding firm for some weeks. The demand for sheets of all kinds in the primary market is heavy and prices are very firm.

Further indication of continued strength in the steel situation in the U. S. is shown in the fact that agents of the Allied Governments are sounding the American market for steel to be delivered during the third quarter and second half of 1917. No definite tonnage has been named, but it will no doubt be as heavy as their requirements during the first half of next year. A few months

ago 500,000 of bars, billets and forgings were purchased for delivery up to July, 1917. A feature of the market has been a tremendous demand for rails. It is said that the entire capacity of the rail mills has been sold through all of 1917. Prices on all steel products are very firm, but there are no price changes to note this week.

### Pig Iron

A further advance of \$1 per ton has been made on domestic pig iron, due, it is stated, to the increase in cost of iron ore and coke. Considerable strength, however, has recently developed in the market as a result of a better demand and improvement in the situation generally. The pig iron market in the U. S. is very active and prices very firm, with an upward tendency.

### Scrap

The situation in the market for scrap metals is improving, and prices are generally firm. There is a shortage of old rails and heavy melting steel, with the result that prices have advanced in both cases. Machine composition and composition turnings are higher, having advanced 1c per lb. Steel turnings are coming in freely, but the demand is not very heavy. The scarcity of copper for 1916 delivery has been a boon to scrap dealers, who are getting unusually high prices for old copper.

### Machine Tools

The situation in the machine tool market is practically unchanged. The bulk of the demand is still for heavy duty lathes, generally for one or two machines, but inquiries for other special tools for munitions plants are also being received in fair volume.

### Supplies

Prices of all machine shop supplies continue very firm, and some advances have to be noted, the most important being in milled products, which are about 10 per cent. higher. Files have also advanced again, the discount now for the most of the makes being 65 per cent., as against 65 and 5 per cent. formerly. Gasoline is firm, following an advance of 10c per barrel on crude oil in the States. Indications point to still higher prices on crude oil, in which case gasoline and benzine will probably be affected.

### Metals

While the metal markets are comparatively quiet, there is a firm undertone, and the situation generally is favorable. The consumption of most metals, particularly copper, continues heavy, which is tending to keep prices up, notwithstanding the large increase in production. Conditions in the trade locally are favorable, the market being steady at unchanged prices, with satisfactory

volume of business. Copper has developed further strength during the week, due to increased demand, principally from domestic consumers. Tin is quiet but firm, with no further development in the market to note. Spelter is firmer on account of increased demand from galvanizing interests. Lead, antimony and aluminum are firm, but unchanged.

**Copper.**—After a short period of quietness, there has been a revival of the demand for copper and the market is very strong. Owing to the possibility of higher prices for copper, consumers are coming into the market, and are covering for their requirements over the second quarter of 1917. Local quotations are nominal and unchanged at 31c per lb.

**Tin.**—The market is firm and higher in London, but quiet and unchanged in New York. A little more interest is being taken in tin, but business is still very quiet. Local quotations firm at 44c per pound.

**Spelter.**—There is a better demand for spelter, including a number of inquiries from galvanizing interests. The

market is firmer, but unchanged, although it has a higher tendency. There is a heavy consumption of spelter being about equal to production. Spelter is firm locally at 14c per pound.

**Lead.**—The leading interest is still quoting 7c New York, while independents are pretty close to that figure. The market is dull, but firm, and business is quiet, consumers being well covered for the time being. Reports from New York state that Canadian consumers have purchased about 2,500 tons of lead in the past week for prompt and November delivery at a base price of 6.85c to 6.90c New York. Local quotation 9c per pound.

**Antimony.**—Canadian consumers have recently purchased considerable quantities of antimony in New York, which has strengthened the market there. Local quotations, however, are unchanged, at 18c per pound.

**Aluminum.**—Demand is less active, but the market holds steady, and prices are unchanged at 68c per lb.

## UNIFORM CONTRACTS FOR SHEET AND TIN PLATE

ADVICES from Pittsburgh state that uniform contracts in the sheet and tinplate industry in which there shall be no guarantees of prices against market declines are contemplated by the National Association of Sheet and Tinplate Manufacturers, which includes in its membership many iron, steel and tinplate corporations in the U.S. Thousands of letters have already been sent out to sheet buyers in the U.S. and Canada calling attention to a resolution recently passed prohibiting guaranteeing prices.

The new contract contemplates an irrevocable sale and purchase not subject to cancellation, postponement of delivery or price revision because of market conditions. Freight is to be paid in cash and not subject to discounts. In order that its business may be legally carried on, the association to-day gave notice that it would apply to the courts on Nov. 8 for a charter.

# CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

## CANADIAN TRADE COMMISSIONERS.

### ARGENTINE REPUBLIC

H. R. Poussette, Reconquista, No. 46, Buenos Aires. Cable address, Canadian.

### AUSTRALIA

J. H. Ross, Stock Exchange Building, Melbourne. Cable address, Canadian.

## EXHIBITION OF ENEMY SAMPLES

THE exhibition of enemy samples which opened in the Convocation Hall Building, Toronto University, last Monday will continue until Monday, Nov. 6. The exhibition is open to the general public and large crowds will no doubt avail themselves of the opportunity of carefully examining the goods. The object of the exhibition is to give Canadian manufacturers an opportunity of ascertaining whether any of the goods on exhibition can be made in Canada either for the home market or for export. The Department of Trade and Commerce invites all manufacturers to attend, whether they have received special invitations or not. It will only be necessary to register the name of the manufacturing firm represented to obtain admission. Manufacturers who wish to have the samples examined by expert workmen can secure tickets of admission for them on application to officials of the Department of Trade and Commerce at the exhibition. Wholesale merchants will also be welcomed.

These samples were collected in many countries by the British Government shortly after the outbreak of the war and were exhibited in all the important industrial centres of the United Kingdom. Wherever they were shown the manufacture and export merchants showed great interest in them. On the occasion of Sir George Foster's recent visit to England he arranged to have the samples brought to Canada and exhibited at the expense of the Department of Trade and Commerce.

Some of the samples are so inferior in quality that it would not be worth while for Canadian Manufacturers to attempt to compete with Germans in making them. Canadian manufacturers can however decide for themselves what articles among them it would be worth while to make in this country. An examination of the samples may suggest ideas of value even in cases where it is not considered advisable to make the same things.

Herbert Kershaw, one of the best informed officials of the British Board of Trade, has come to Canada in charge of the samples and will be glad to answer questions of visitors at the exhibition. Officials of the Department of Trade and Commerce will also be present to give information. The exhibition is in Examination Hall at the back of Convocation Hall Building.

There are 8,000 German and Austrian made articles in the exhibit which were bought in the open markets of the world. Wherever possible, each article has the wholesale and retail price, place of purchase, and other details affixed. The articles shown are of great variety

and include the following classes of goods:—Textiles, soft and hard haberdashery, fancy and leather goods, glassware and crockery, hardware, enamel goods, aluminum ware, etc., tools, cutlery and electro goods and numerous miscellaneous lines.

The hours during which the exhibition is open each weekday, are from 10 a.m. to 6 p.m. On Thursday and Friday, this week and next week, it will be open until 9 o'clock p.m. to permit industrial workers who may not have the opportunity of getting out during the day to attend in the evening.

## WHAT HAS BEEN WASTED

THE second report of the Committee of Public Accounts issued as a White Paper recently, shows a net deficit on the naval accounts of \$258,759,310, and on army accounts of \$1,059,337,705. The round total of the two is \$1,318,100,000. In the economies effected is a saving of \$15,000,000 on jute sand bags. The Ministry of Munitions had effected substantial reductions in prices for equipment, guns, etc., as compared with the early stages of the war, notwithstanding increased cost of labor and materials. The Admiralty had recently placed orders for shells, the price to be settled later, and were employing accountants to investigate the books of the firms as to the actual cost. It was regretted that no such system was adopted before the war in order to break down rings among contractors or to enable economies such as were being effected by the Ministry of Munitions.

As regarded army supplies, after some difficulty a system was evolved in June, 1915, for securing such supplies as were required at prices which were fair and reasonable in the interest of the public. This system was rendered more effective by the legislation in February last, which had the effect of breaking up and preventing a combination of manufacturers against the Government. They had taken control of whole trades, and thereby effected great economies in such necessities as leather and jute. The committee hoped that the experience gained and the organization instituted for dealing with this aspect of the nation's affairs would not be lost sight of on the conclusion of peace. They hoped the Admiralty and the War Office would henceforth unite in efforts to effect national economy in the buying departments. The cost of hiring ships for detaining alien prisoners has been £450,000.

The committee regretted no organized system existed for the prevention of waste in the food supply to the troops, but this defect was being remedied. They also regretted that arrangements were not made to prevent the payment of undue brokerage commission on the pur-

chase of stores. The committee were informed that sites for all camps, some of which had been regarded as unsuitable, were chosen for military reasons. The committee intimate approval of an Excess Vote for both naval and army deficits. The committee state that the payments in connection with the purchase of sugar at March 31, 1915, amounted to \$93,000,000, and the amount received in respect of sales was \$57,470,000. The balance was represented by stocks of sugar to a much greater value. The committee are informed that if all sugar were now realized a profit of something like seven and a half million dollars would be made.

## SIX MONTHS' TRADE OVER BILLION MARK.

THE hundred per cent. increase in Canadian trade for five months, as shown in the September statement, has been maintained, the total trade of the Dominion for the first six months of the fiscal year being well over the billion-dollar mark.

The monthly return issued under the direction of the Minister of Customs shows an increase from \$92,487,862 to \$161,797,951 in September, bringing the grand total for six months up to \$1,148,899,412, as compared with \$559,533,363 in the corresponding period of the previous fiscal year.

The Customs revenue in this period has risen from \$44,421,033 to \$70,102,854.

Excluding coin and bullion, the September imports amounted to \$68,796,262 compared with \$38,030,320 in September of last year. In the six month period the imports have reached a total of \$390,995,243, an increase of \$177,402,724.

Exports of domestic products, exclusive of coin and bullion, have more than doubled in six months, the figures being \$536,721,514, and for last year, \$246,392,148. September exports amounted to \$90,285,181, a gain of \$44,155,446.

The export expansion is found chiefly under the heads of agriculture and manufactures, the increase under the former being from \$11,139,935 in September, 1915, to \$25,164,034. Exports of manufactures in September increased from \$9,244,974 to \$37,801,177. In the six month period these exports were, agriculture \$206,141,326 a gain of \$146,794,343, and manufactures \$190,823,240, a gain of \$119,346,421. Exports of forest and fishery products declined slightly during September.

**Montreal, Que.**—It is understood that a French syndicate are seeking to acquire the Donnacona Paper Co.

## The WILLIAMS Turret Lathe

Prompt  
Delivery

For Boring, Base  
Recessing and  
Nose Operation on  
Shells up to 6 in.

### —SPECIAL FEATURES—

2-Step Cone for 6" Belt.  
Hole in spindle bored large enough to take 6" shell.  
Extra large spindle bearings.  
Can be equipped with 3-jaw Universal or Air Chuck.  
Long and Heavy Turret Slide, well gibbed.  
Extra Large Turret ensures rigidity under heavy cuts.

Powerful indexing arrangement with automatic trip.  
Four instantaneous Feeds.  
Weight about 7,000 lbs.  
No Friction devices are used. Countershaft is equipped  
with Tight and Loose Pulleys.

## This Geometric Die Head

is making good in a United States Navy Yard. (4½-in. size, Style "D.") It was selected because it was known that it would make good.

One thread is as readily cut as another in a Geometric Self-opening Die Head, because the Head is built for the Thread.

Long threads or short, heavy or light work, large diameters or small, fine threads or coarse—they are all alike to the Geometric Die Head.

Whatever the make of your Screw Machine, a Geometric Self-opening Screw-cutting Die Head can be furnished to fit it. Take up your threading propositions with us.

# INDUSTRIAL <sup>A</sup><sub>N</sub><sup>D</sup> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**Mimico, Ont.**—The Dominion Abrasive Wheel Co. will build a factory here.

**Rainy River, Ont.**—Blackmore Bros. will build a machine shop at a cost of \$15,000.

**Toronto, Ont.**—John Inglis & Co. will erect an addition to their forge shop at a cost of \$7,000.

**Lindsay, Ont.**—Fire on Oct. 17, destroyed the office and plant of the Machine Automatic Telephone.

**Kitchener, Ont.**—The Canadian Blower & Forge Co. will build an extension to their machine shop, to cost about \$100,000.

**Galt, Ont.**—Wells Brothers, of Canada, Ltd., manufacturers of taps and dies, will build an addition to their plant to cost \$2,000.

**Toronto, Ont.**—The Willys-Overland, Ltd., are making repairs and preparing for extensions at their West Toronto plant as rapidly as possible.

**Renfrew, Ont.**—M. J. O'Brien, of this town is proceeding with the construction of a hydro-electric power plant at Calabogie near here, at an estimated cost of \$150,000.

**Port Colborne, Ont.**—The Foundation Co., who have the contract for the new nickel refinery are getting their plant together ready for starting work on the foundations.

**Port Moody, B.C.**—The Port Moody Steel Works, Ltd., is now making merchant bars, and proposes to install larger mills after the two open-hearth furnaces now under construction are in operation.

**Port Arthur, Ont.**—The first unit of the proposed pulp and paper mill to be built here will cost about \$500,000 while the plant when complete will represent an investment of \$1,000,000. A. G. McIntyre is consulting engineer.

**Victoria, B.C.**—Permission has been granted to McCarter Bros. to build a corrugated iron shingle mill at the foot of Rock Bay Avenue. The owners promise that combustion chambers of such a type will be used to fire the boilers as will prevent any charred sawdust nuisance.

**Welland, Ont.**—Judge Wolfe of New York and Eugene F. Diener of Dunn-

ville, Ont., were in Welland recently in connection with plans which are shortly to be carried out to manufacture gasoline in Canada. A site has already been purchased in the Township of Canboro, 5 miles north of Dunnville.

The British Columbia Copper Co. is installing a pumping plant to elevate the water from the Similkameen River to a distributing point 1,700 feet above the river through a pipe line 6,000 feet long. The equipment will consist of triplex pumps, and the pump line will be composed of 4-in. high-pressure hydraulic pipe in the lower station and steel pipe of 6-in. diameter at the discharge. The water will be used to supply the mine, the camp, and a 50-ton experimental mill, which will be used for the working out of a concentration process preliminary to the erection of a 2,000-ton plant on the Similkameen River.

## General Industrial

**Montreal, Que.**—The St. Lawrence Brewery Co., will build an extension to their brewery.

**London, Ont.**—Fire on October 19 destroyed the William A. Jenkins Mfg. Co. factory, causing a loss of approximately \$30,000, which is covered by insurance.

**Belleville, Ont.**—Frankford cheese factory was totally destroyed by fire on Oct. 18. The entire loss will exceed \$8,000, with only \$4,000 insurance \$3,000 on the building and \$1,000 on the contents.

**Owen Sound, Ont.**—It is reported that a new industry for Owen Sound is under consideration. Mr. Menziés of the Board of Trade is negotiating with the syndicate which is interested in the proposition.

**Trenton, Ont.**—The Benedict Co., manufacturers of silver plated ware of Syracuse, N.Y., are fitting up the factory lately occupied by Lloyd and Sons, and will manufacture here for their Canadian trade.

**Niagara Falls, Ont.**—The Perfection Tire Co., are ready to go ahead with the erection of their factory. Satisfactory arrangements will be made to give the company power concessions promised by the municipality without violating Hydro rates or selling power below the price determined by the Commission.

**Collingwood, Ont.**—Fire on Oct. 18, destroyed the large coldstorage building and receiving warehouse of the Dominion Fish Co., situated on the wharf of the G.T.R. The loss will be several thousand dollars, on which there is said to be some insurance, held by the Booth Fish Co., Chicago.

## Municipal

**Regina, Sask.**—The City Council will build a new pumping station at Boggy Creek.

**Smith's Falls, Ont.**—Town Council is considering the construction of a filtration plant, at an estimated cost of \$20,000.

**Shallow Lake, Ont.**—A by-law will be voted on by the ratepayers on October 30 to endorse a loan of \$4,000 to the R. Caesar Woodworking Co.

**St. Romuald d'Etchemin, Que.**—It is proposed to make improvements to the waterworks and sewage systems. A by-law to raise the necessary funds will be submitted on October 30.

## Electrical

**Wainwright, Alta.**—The Town Council will install an electric light and power system. The B. L. Perry Co., of Edmonton will do the work.

**Dublin Township, Ont.**—The Township Council will shortly submit a by-law to authorize the installation of a hydro-electric system at an estimated cost of \$5,000.

## Building Notes

**Toronto.**—Smith Bros. have taken out a permit for a paint shop at 175 Duke street to cost \$8,000.

**Trenton, Ont.**—The Board of Education have decided to erect a new High School in East Trenton to cost \$3,600.

**Toronto.**—The Canadian National Carbon Co. have taken out a permit for a three-storey factory on Paton road, to cost \$23,402.

**Vancouver, B.C.**—A permit for the construction of Pantages Theatre has been issued by building inspector McKenzie. The new vaudeville house which

**Trenton, Ont.**—A moving picture studio company, known as the Canadian National Features, Ltd., have made arrangements to erect a large three-storey building in one of the parks here, Jos. Shea, of Toronto, is connected with the enterprise.

## Wood-Working

**St. John, N.B.**—The St. Stephen Lumber Co.'s plant at St. Stephen has been destroyed by fire. The loss will be about \$100,000.

**Penticton, B.C.**—F. Demuth's lumber mill at Milford, on the Kettle Valley Railway, 40 miles from here, was burned down on October 14. The cause of the fire is unknown.

**Tillsonburg, Ont.**—Fire totally destroyed the box factory of James Trevail & Son of South Middleton on Oct. 17, together with the house and contents. The loss will be very heavy but is partly covered by insurance.

**Tillsonburg, Ont.**—The box factory of James Trevail & Son, of South Middleton, was destroyed by fire of an unknown origin on October 17. The loss will be heavy, with only \$1,000 insurance on buildings and contents.

**Deseronto, Ont.**—The by-law giving the Dominion Hardwoods, Ltd., free water, and exemption from taxes, except school and war taxes, for ten years, was carried on Oct. 16, by a vote of 350 for and 4 against.

**St. Stephen, N.B.**—Haley & Sons' lumber and planing mill was totally destroyed by fire on October 17, together with thousands of dollars' worth of lumber. The plant was valued at about \$100,000, and is practically a total loss, with \$58,500 insurance. Messrs. Haley will rebuild and in the meantime they will run their Calais box and lumber mill day and night to fill their orders.

## Tenders

**Toronto.**—Tenders will be received by the Chairman, Board of Control, City Hall, up to October 31, for the supply and delivery of the following:—Brass and bronze castings; brass work for house services, cast iron pipes, hydrants; pipe fittings and valves, supply of lead pipe, special castings, stop valves, iron castings of manhole, gullies, grates, etc., general supplies and tools, iron and steel, house numbers, oils, lubricating, rubber valves. Specifications

and forms of tender may be obtained at the Works Department, Room 12, City Hall.

**Hawkesbury, Ont.**—The Town Council is calling tenders for one electrically-driven turbine pump of 1,000,000 gal. per day capacity, direct connected to a 100-h.p. motor; one pump of 750,000 gal. per day capacity, with 75-h.p. motor, and for one pump of 500,000 gal. per day capacity, with 50-h.p. motor. M. Gareau is town clerk.

**Toronto, Ont.**—Tenders will be received by Frank Barber, engineer of the Township of York, up to October 30, for the supply and delivery of the following material:—Tender A-1—for supply and delivery of approximately 20,500 ft. of 24 in. cast iron pipe; A-2—for the supply and delivery of cast iron pipe (12 in. and smaller sizes); B-1—for supply and delivery of 24 in. special castings; B-2—for supply and delivery of special castings, 12 in. and smaller sizes; C-1—for supply and delivery of 24 in. valves; C-2—for supply and delivery of 12 in. and 6 in. valves; C-3—for supply and delivery of air valves; D—for supply and delivery of hydrants; E—for supply and delivery of tops, covers and plugs. Plans and specifications may be obtained at the office of Frank Barber, engineer, Toronto.

**Ottawa, Ont.**—Tenders, addressed to J. W. Pugsley, secretary of the Department of Railways and Canals, Ottawa, Ont., will be received up to November 15 for the construction of a reinforced concrete elevator with a capacity of 500,000 bushels. Plans, specifications and blank form of contract may be seen at the office of the following:—Chief engineer, Department of Railways and Canals, Ottawa; railways, Moncton, N.B., general superintendent, Winnipeg, Man.; resident engineer, Fort William, Ont.; John S. Metcalfe Co., engineers, Montreal, Que. Contractors who wish to obtain plans and specifications temporarily for their own use may obtain same on depositing a certified bank cheque for \$100.

## New Incorporations

**Henden Lumber Co.** has been incorporated at Toronto with a capital of \$500,000 to carry on a sawmill and planing mill business, Timmins, Ont. Incorporators F. Austin Daly, W. Aston Gordon and Peter MacLeod all of Haileybury, Ont.

**American Linseed Co.**, has been incorporated at Ottawa with a capital of \$40,000 to operate elevators and to manufacture linseed oil, cake and other products at Winnipeg, Man. Incorpor-

ators, A. P. Allensworth, H. P. Grundy and F. W. Louthood all of Winnipeg.

**Canada Gelatine Co.**, has been incorporated at Ottawa with a capital of \$250,000 to manufacture glues, gelatines of all kinds and chemical fertilizers at Brantford, Ont. Incorporators Lloyd Harris of Brantford, George Upton and Jesse Lyman of Boston, Mass.

## Contracts Awarded

**Dundas, Ont.**—The John Bertram & Sons Co. has let the contract for the erection of a pattern shop to E. G. M. Cape & Co., of Montreal.

**Lethbridge, Alta.**—The contract for a filtration plant has been awarded to the Roberts Filter Mfg. Co., Darby, Pa., Approximate cost, \$100,000.

**Assinboia, Sask.**—The general contract for the construction of a water-works system has been awarded to M. S. Holmes, Souris, Man. Approximate cost, \$68,000. Consulting engineers, Murphy & Underwood, Saskatoon.

**Québec, Que.**—Price Bros. have awarded contracts to the S. Morgan Smith Co. for three turbines for their mill at Rimouski and three turbines from the same concern for the pulp mill at Jonquiere, Que.

## Marine

**Vancouver, B.C.**—The C.P.R. propose extending the passenger pier at this port approximately 400 feet.

**Halifax, N.S.**—The North Atlantic Fisheries, Ltd., of this city has sold its Port Hawkesbury plant to Leonard Brothers, of Montreal and St. John.

**St. Lawrence River Low.**—Word was received at Kingston recently, that the water is very low below Iroquois, being some five inches under the usual vessel draught of 14 ft.

**Vancouver, B.C.**—Captain F. R. Derrick, on behalf of the Stolt Nielsen Co., has signed contracts for the construction in Vancouver of three steamers for his Norwegian principals. The vessels are to be standard type freight carriers of 8,800 tons, costing \$1,225,000 each.

**Ottawa, Ont.**—The Trade and Commerce Department announces that the Cunard Steamship Co. have chosen Halifax as their Canadian winter port for the new steamship service to be established between Bristol and Canada. Their steamers will call at both Halifax and New York on east and west-bound voyages.

water  
supply

THE American Museum of Safety conferred a Gold Medal Award upon the Puro Sanitary Drinking Fountain at the First International Exposition of Safety and Sanitation. The Puro Sanitary Drinking Fountain won because it deserved to win—Puro had merits that made it stand head and shoulders above any other drinking apparatus.

**Safe                      Simple  
SANITARY              Economical  
Quickly Attached**

These are the qualities that forced the leading safety and sanitary engineers to pick Puro in preference to all others.

No device can be as efficient that does not contain all these qualifications; and Puro was not tied for first place; Puro was first.

Don't be satisfied with half-way goodness, or makeshift drinking arrangements for your employees.

If the men in your factory must drink, give them a clean drink.

Puro is clean—it does not rust or corrode.

Puro is economical. It allows just the proper amount of cool, clean, fresh water to come through the bubbler. No spurting, no overflowing, no loss. Puro regulates itself. You can attach it in five minutes.

Tell us how many men in your factory and your water pressure in pounds—

We'll tell you just what it will cost to "PURO-FY" YOUR WATER SUPPLY.

**The Value of Multiplied Minutes**

We'll suppose that you have 10 men using files, on an average of an hour a day—in all 10 hours a day; or 3000 hours a year. Value in wages at 40 cents an hour,

**\$1200****Delta Files**

will save 10% of man-time in the doing of a job.

It means that in a shop with only 10 file users you save \$120 a year; or \$12 per man.

It would pay the premium for example on a \$2500 endowment life insurance policy.

Calculate this for a period of 10 years — for 20 years: and you have on a 10-man basis \$12,000, or \$24,000.

We leave it to you to say what a saving of \$120 a year will pay—\$10 a month.

This is what we say with our pen and with our money.

**DELTA FILES** will cut faster and retain their cutting edge longer than any other file made.

Skeptical? Challenge us to make good our claim.

If we are right the inference is obvious.

Send for a sample file to have it proven.

**DELTA FILE WORKS**

Starke, Seybold, Montreal;

Wm. Stairs, Son &amp; Morrow, Halifax;

Merrick-Anderson Co., Winnipeg.

ALL LEADING JOBBERS

**Great Lakes Water Impure.**—Apparatus carried by Great Lakes steamers to purify lake water for drinking is described as 'woefully inefficient' in a bulletin published by the Public Health Service, Washington, D.C. No purification method is in use by any steamer on the lakes, it is declared, which fulfils Federal requirements by ensuring safe water under all circumstances.

**Merchant Shipbuilding.**—A substantial increase in merchant shipping under construction in Great Britain for the three months ending October 1 is reported by Lloyd's. The report shows that on October 1st there were 46 vessels building, representing a total of 1,789,054 tons. This represents about 249,000 tons more than the amount under construction at the end of the previous quarter, and 253,000 tons more than that building a year ago.

**Bunker Coal Prices.**—The advance of 50 cents a ton to a rate of \$3.95 in the price of fuel for steamers, announced by a leading shipper of Cleveland, O., has not been made general, and some of the coal men say they have not decided what action they will take along that line. Boat men claim that steamers carrying coal and ore at contract rates cannot stand the advance. At the rate operating expenses are being increased, vesselmen will be slow in making freight contracts for 1917, as boats carrying contract ore and coal are having pretty thin picking.

**Vancouver, B.C.**—If plans which are at present in contemplation go through successfully, orders for vessels will be placed with the Wallace Shipbuilding Co. on the north shore and with Messrs. Coughlan & Son at their proposed yard on False Creek. So far as Wallace's yards are concerned, it means the expenditure of between four and five million dollars, but with regard to Coughlan & Son, no definite figure has yet been mentioned. Otto Dohl, of Philadelphia, representing a Norwegian shipping syndicate, and Jesse Stearns, representing American capitalists, are here in connection with these schemes.

**Anchor-Donaldson Line.**—A new steamship company, to be known as the Anchor-Donaldson Line, organized by a fusion of interests of the established Anchor and Donaldson Steamship Co., has been organized for Glasgow-Canadian passenger and freight trade. Directors of both companies will be represented on the Board of the new company, with Sir Alfred Booth of the Cunard Line as Chairman. The steamers *Letitia*, *Cassandra*, *Athenia* and *Saturnia*, will be transferred to the new organization. The Donaldson Line is now operating a service between Liver-

pool, the River Plate and leading South American ports. It has a fleet of twenty-five ships, totalling 89,992 tons. The Anchor Line operates a passenger and freight service between Glasgow and New York, calling at Liverpool in conjunction with the Cunard service. It has a fleet of fifteen ships, with a total tonnage of 114,222 tons.

## Railways—Bridges

**Newcastle, Ont.**—The ratepayers have voted in favor of an expenditure of \$2200 for a new concrete bridge.

**Victoria, B.C.**—Tenders for the timber swing span for the reconstruction of the Rock Bay bridge have been opened as follows by the City Council, Clarence Hoard, \$21,135; Charles M. Cookson and William Ross, \$12,947; Watson, Hall & Huntley, \$18,277; MacDonald, Middleton & Bruce, \$15,500. The tenders have been referred to the city engineer and the harbor committee.

## Personal

**J. F. S. Madden**, formerly manager of the Canadian General Electric Co. at Winnipeg, has been promoted to the head office at Toronto.

**Lieut. C. A. Page**, sales manager for the Canadian Hart Wheels, Ltd., Hamilton, Ont., has received an appointment with the 164th Battalion C.E.F., and expects to go overseas shortly.

**F. W. Blythe**, district manager of the Canadian Allis-Chalmers, Ltd., at Winnipeg, has been promoted to the head office at Toronto.

**Col. Thomas Cantley**, president Nova Scotia Steel & Coal Co., New Glasgow, N.S., has been elected a director of the Institute to fill the vacancy caused by the death of Thomas J. Drummond.

**W. C. Hawkins**, of Hamilton, Ont., managing director of the Dominion Power & Transmission Co., and **F. W. Teele**, of Boston Mass., formerly vice-president and general manager of Porto Rico Railways Co., have been elected to the board of Southern Canada Power Co.

**Sir William Benjamin Bowring**, Bart., of Liverpool, a ship owner, is dead. Sir William Bowring was one of the best known shipping men of England, and was identified with marine interests in Newfoundland and New York. He was born in St. John's, Nfld., in 1837. Sir William was chairman of C. T. Bowring & Co., of London, Liverpool, and Cardiff, and a director of Bowring Brothers, of St. John's.

**W. M. Ackworth** of London, Eng., will be appointed a member of the Railway Board of Inquiry, which is investigating the railway situation in Canada, in consequence of the resignation through ill health of Sir George Paish. Mr. Ackworth has had great experience in railway matters, having been a member of several commissions on railway questions in Great Britain, and he is the author of several works on the railways of the United Kingdom, upon railway economies.

**R. F. Randolph**, a steel expert who has been in the employ of the Bethlehem Steel Co. for the past seven years and was recently appointed general superintendent in charge of the steel plant by the Dominion Steel Corporation, has arrived in Sidney, N.S. and will immediately take up his new duties. Mr. Randolph is recognized as being one of the leading steel experts in America. Mr. Martin whom Mr. Randolph replaces, has resigned and it is understood, is leaving Canada.

## Trade Gossip

**Frank Martin**, Canadian representative of Wm. Garthwaite, of Paris, managing director of the Marine Navigation Co., will open an office for the company at Halifax, N.S.

**New Output of Customs.**—Port Maitland, Ont., has been created an outport of customs and warehousing port under the survey of the port of Hamilton. A permanent harbor headline has also been established at that point.

**Hamilton Brass Ltd.**, has taken over the business of the Hamilton Brass Mfg. Co., and will manufacture bib cocks, hose nozzles, couplings, etc. N. L. Bailey, formerly with the Tallman Brass & Metal Co., will be superintendent.

**Labor Adviser to Munitions Board.**—At the request of the Imperial Munitions Board of Canada, H. E. Morgan of the labor supply department of the Ministry of Munitions, London, has been temporarily detached by the Minister for the purpose of proceeding to Canada to advise the Board on British procedure in regard to the labor in munition factories.

**No Imports of Steel.**—The London *Daily Chronicle's* parliamentary correspondent understands that the iron and steel sub-committee of Lord Balfour's committee, which was appointed to make recommendations on a basis of the Paris economic proposals, has presented a report urging prohibition of iron and steel imports into Britain after the war, during at least the period of demobilization and reconstruction.

Prices lower than any other lathe of same specifications because of  
volume of manufacture and fixed low percentage of profit over actual  
cost of production.

### Will Report to Russia on Hydro.—

A favorable and exhaustive report of the practical use that is being made of Hydro power by the farmers of Ontario province, particularly in Oxford and Waterloo Counties, will be forwarded to the Russian Government by Prof. Boris Bakhtmetoff, of the Agricultural Department of the Electro Technical International Commission of Russia.

**Vancouver, B.C.**—Robert Dollar, head of the Canadian Dollar Co., steamship owners has bought the sawmill equipment of the Ruskin mill and intends to manufacture lumber for export through Vancouver. The mill, which was built and formerly operated by the E. H. Heaps Lumber Co., is one of the most modern mills in the coast district with a capacity of 100,000 feet of lumber and half a million shingles daily.

**The Dominion Bridge Co.**, in conjunction with the Montreal Ammunition Co., and the Dominion Copper Products Co., are displaying at the electrical exhibition, Winnipeg several sizes of shells in the various stages of manufacture. The exhibit comprises complete and half sections of all shells, ranging from the 18 pound shrapnel and the 18 pound high explosive shell to the 6 and 9.2 howitzer shells. The cartridge cases for these shells are also on display, showing the various steps in their manufacture from the original brass disc. Included in the exhibit are 75 mm. shells which have been manufactured for the Russians.

**Magazines as Packing**—The Alexandria & Ramleh Railway Co., Egypt, calls attention to the inconvenience that may result from possible delay in withdrawing goods from the local customs, on account of the presence in cases containing merchandise of illustrated newspapers and magazines used as packing material. Exporters should be warned against using printed matter of any nature in packing merchandise intended for belligerent countries. An ulterior motive is always suspected when uncensored printed matter comes to a belligerent country through channels other than the public post.

**Change of Firm Name.**—The engineering work at the Provincial Hospital for the Insane at Whitby, Ont., which was designed by MacMullen, Riley & Durley. Constructing engineers Montreal and Toronto will be carried to completion by the firm of MacMullen, Riley & Angus who have taken over the unfinished work of the former firm. Mr. Angus whose name appears in the new organization is well-known in engineering circles in Toronto and has been for some years practising his profession in this city. The new firm will continue the

design of heating, ventilating, plumbing and electrical equipment of buildings as carried on by them separately in the past and will also specialize in the building design and equipment of industrial plants.

**Freight Embargo at Toronto.**—The inability of the railways and the teaming companies to obtain ample labor has forced the G.T.R. to place an embargo against less than a carload of freight from all points consigned to Toronto. The C.P.R. also had an embargo which became effective on October 9th, but they have been able to check up their congestion in the local freight sheds, with the result that the embargo has been discontinued. If the company finds it impossible to keep pace with the enormous volume of freight moving, the order will be restored. The embargo placed by the Grand Trunk is applied to all freight less than a carload, except perishable goods and munitions. The Toronto terminals are congested with freight, much of which cannot be delivered.

**C.M.A. Maritime Branch Convention.**—The Convention of Maritime Province manufacturers held in New Glasgow, N.S., towards the end of last week may be said to have more than fulfilled the highest expectations of its promoters in every direction. Considerable interest was shown by those present in the work of constructing locks on the East River for the improvement of ocean vessel navigation, and in the scope and variety of work being undertaken at the plants of the Eastern Car Co., and Nova Scotia Steel & Coal Co., New Glasgow. Among those who addressed the Convention sessions were G. M. Murray, secretary the Canadian Manufacturers' Association, and Hon. Geo. H. Murray, Premier of Nova Scotia. "Development of a Canadian Mercantile Marine," and "Development of our Resources" were the subjects discussed by these gentlemen respectively.

## Catalogues

**Planing Machine.**—Joseph Appleyard, Bradford, Yorks, England, has issued a leaflet dealing with a side planing machine. The machine is illustrated and described while testimonials are also included.

**Laundry Machinery.**—Two bulletins issued by Joseph Appleyard Bradford, Yorks, England, deal with an extensive line of laundry machinery. Each type of machine is illustrated and described while shipping weights and prices are also given. A number of testimonials are included.

## Book Review

**Railway Organization and Management**, by James Peabody, late Statistician, Atchison, Topeka & Santa Fe Railway. A clear and usable book on this subject has long been needed and Mr. Peabody's attractive volume will be found more than adequate. His position as chief statistician of the Santa Fe system gave him unique opportunities for collecting material, and he proved himself capable of scholarly and interesting presentation when, shortly before his death, he wrote this book. "It is not surprising," he remarks in the introduction, "that the railroad organization to the uninitiated seems to be bound round and round with an endless amount of red tape, exhausting patience and trying and expensive; whereas if the organization were properly understood and the activities of each department borne in mind, this seeming over-complexity would disappear. "Railway administration involves so many and such widely varied subjects as to require for its successful conduct the largest possible survey as to commercial conditions, coupled with a knowledge of detail that takes into account all the varied operations incidental to the service. Properly to manage such an undertaking necessitates the employment of many men of many minds, and the plan by which homogeneity and efficiency are attained is known as railway organization." The various departments are taken up in order, administration, engineering, operation, traffic, accounting, etc.—and the work of each and the arrangements for performing that work are clearly set forth. No such complete list and description of railway positions had been put into any previous work. Elaborate charts show the relations of the officials to each other and guide the reader through the almost infinite complexities of the organization. The book also discusses in a most interesting fashion the problems of all kinds which railroad men have to meet, from the occasional vagaries of law makers to the scarcity of wood for ties. Such vital topics as government regulation, valuation, education of apprentices, pensions, staff versus line control, reports, statistics, advertising, competition, track elevation, electrification, traffic associations, rate-making, interline billing, the management of great terminal stations, all have concise but illuminating treatment. So wide is the range of subjects and so incisive the handling of them that the volume may well be called the most attractive general introduction to the business of railroading that has yet been published. The book is issued by the La Salle Extension University, Chicago.

## Galt Machine Screw Co. — Its Plant Equipment and Product

### Staff Article

*Development of our metal-working industries has in the past two years been almost wholly in the direction dictated by the demand for munitions, and instances have been few in which the specific purpose of a plant establishment or extension has been to break into other opportunity offering. The subject matter of this article is, however, an instance of the latter, even notwithstanding the fact that for a time munitions production in line with the scope of the installed equipment was successfully undertaken.*

**T**HE Galt Machine Screw Co., started operations in October, 1915, at their new plant located at the north end of Jackson Park, Galt, Ont. Incidentally, we might say, this section of the city is developing into an important manufacturing district. The company was organized by R. W. Roelofson, a prominent citizen of Galt, and was at a later date incorporated. Mr. Roelofson is president and general manager, and C. K. Jansen, secretary - treasurer. At the time of its inception, the demand for the product which the company proposed manufacturing, prompted the belief that there was a wide field for such goods, particularly if the product were of high class manufacture and accurate. A high degree of accuracy has, therefore, been the principal aim of the company, and in the various manufacturing operations this is kept in view. One of the most interesting features from a mechanical standpoint is the installation of automatic machines which take up prac-

tically half the floor area in the main shop and are arranged so that they occupy a minimum of room consistent with efficient operation.

### Plant Layout.

The factory is of modern design and was constructed and equipped entirely for the purpose of making all kinds of machine screws. It is served by track connections from both the C.P.R. and

G.T.R., while cheap power is available from the Ontario Hydro-Electric System. The building is modern in design and is of slow burning mill construction. The walls are brick, with wood columns. The centre bay of the main shop has a saw-tooth roof, providing ample light in addition to that from the windows at the side. The shops and offices are all on the ground floor, with a basement under the main, or machine shop. This shop

covers a considerable proportion of the entire plant. At the north end of the factory is a large stock room with commodious offices adjoining, the offices being bright, airy, and well appointed. Adjoining the stock room is the heat treating department, equipped with the most modern apparatus of that nature available. The stock room comprises the raw material storage, finished product storage, shipping room and time-keeper's office, where the employees' entrance is located, and in which is installed an International Time Recorder Co. time clock.

Group of four-spindle automatics of the larger sizes, which are used for making all kinds of automatic products from bar stock, as well as heavier sizes of cap and set screws.

Group of smaller four-spindle automatics with some of the latest types of single spindle automatics in the foreground.

The machine shop content embraces equipment of the most modern type available for the manufacture of the product. At one end of the shop is a well-appointed tool room. In the machine shop are installed several Canadian Crocker-Wheeler electric motors, ranging from 18 h.p. to 50 h.p., which drive the main line shafts. The motors take power from the Ontario Hydro-Electric 550-volt line. The machines are all driven from individual countershafts and are arranged in groups so that certain sections or batteries of machines can be operated by one or more motors, as the case may be.

The health of the employees is a primary consideration in view of its economical advantages. The shops are bright and well ventilated, while bubbling fountains have been installed for drinking purposes. The illumination at night is almost as bright as during the day, being in fact a "daylight factory" all the time. The care of the employees is shown in another way. All cutting oil after being used in the automatic machines is pumped to a tank in the basement and purified by blowing steam through same. The oil is then allowed to settle in other suitable tanks, by which means all metallic particles and other foreign matter are eliminated. This treatment not only improves the lubricating properties of the oil, but it is also rendered antiseptic and will not cause sore places on the operators' hands.

The artificial lighting system, particularly in the machine shop, is most effective and helps in no small degree towards the general efficiency of the plant. Nitrogen-filled lamps of 250 watts are installed in the shops, each lamp having a white enameled reflector. The lighting value in the machine shop is equal

to  $2\frac{1}{2}$  c.p. per square foot of floor area, an unusually high percentage.

The plant is heated by means of a low pressure steam system. The fire-box boiler for this was supplied by the Taylor-Forbes Co., Guelph, Ont., and is located in the basement—the boiler room being of concrete construction and fire-proof. The heating pipes are installed along the walls in sections and the system is so arranged that the amount of radiation can be regulated according to the outside temperature. An automatic sprinkler system is also installed.

#### Product.

The company makes a full line of cap and set screws, square and hexagon head, round, flat, flister and button head; taper pins, finished and semi-finished nuts, studs, coupling bolts, patch bolts, washers, etc. The line in fact includes anything that can be produced from bar

stock, in steel, brass, copper, or fibre, etc. The range is wide and includes parts that would be used in the construction of anything from a locomotive to a typewriter. The product is used in the construction of machines of various kinds, such as wood and iron working tools, agricultural machinery, sewing machines, typewriters, adding machines, computing scales, washing machines and all manner of automobile parts.

In order to measure up to the high degree of accuracy demanded, great care has to be taken in manufacturing to ensure the desired results. The company make their own tools and fixtures in order to obtain the required accuracy. The "Johansson" system of Swedish gauges is used for all standards other than for threads, and for thread standards the Brown & Sharpe thread micrometer is used for establishing all pitch diameters. All bar stock is unloaded from the cars on the tracks running alongside the factory, and is piled in racks in the stock room. The different grades of bar stock used must conform to physical tests before being shipped from the mills, none but the highest grades of stock being used.

#### Automatic Machine Installations.

In the manufacture of screws, automatic machines plan an important part, and the plant of the Galt Machine Screw Co. is no exception to the rule, in this regard. The principal equipment therefore consists of eighteen automatic machines of various sizes and capable of producing any size or type of machine screw required. Of this number, thirteen are "Gridley" automatics, built by the Windsor Machine Co., Windsor, Vt., and five are "Cleveland" automatics, built by the Cleveland Automatic Machine Co., Cleveland, Ohio. The installation of "Gridley" automatics includes two  $1\frac{3}{4}$ -inch, 4-spindle machines; five  $1\frac{1}{4}$ -inch, 4-spindle machines; five  $\frac{3}{4}$ -

Close view of Brown & Sharpe automatics, which are adapted for the making of high-grade screw products of the smaller sizes.

Group of single spindle Cleveland type automatics of the larger sizes. These machines are adapted for the production of very accurate work from bar stock in a variety of diameter and length, and applicable alike to typewriters and the very heaviest type of iron-working equipment.

inch, 4-spindle machines and one 2 1/4-inch, single spindle machine. The installation of "Cleveland" automatics consists of two 7/8-inch to 1 1/4-inch machines, two 1 1/4 to 1 1/2-inch machines, and one 2 1/4-inch machine. The sequence of operations is the same on all machines when producing the same class of work. The extensive line that can be produced on these machines, however, requires a large and varied assortment of tools and fixtures, the application of which differs according to the work to be performed. A detail of manufacture covering each and every product of the company on these machines is not included in the present article. A brief description covering the production of a cap or set screw on a "Gridley" automatic may not be without some interest, however.

The machine in question holds four bars, and the work is completed at four positions, making one revolution of the rotary spindle. A carrier spindle holds the tooling fixtures, while on the cross slide are two tools, front and back, for forming and cutting off. The bar stock is fed through at the fourth or cutting-off position, and comes up against a stop on the carrier spindle. The machine then indexes to the first position where the first turning operation is performed by a tool on the carrier spindle. While this is being done, a forming tool on the cross slide in front faces up the head of set screw. The machine then indexes to the second position where the finish turning operation is done; at the third position, a die attached to the carrier spindle travels forward and cuts the threads. At the fourth and last position, the cap screw is cut off by a tool on the back of the cross slide. The operation of the machine is practically the same for all classes of work but the tools of course are different.

One of the "Cleveland" automatics installed is a 2 1/4-inch single spindle machine for heavy work. This machine can take four tools on the turret and has a cross slide for the forming and cutting off tools. Only one length of bar stock is used at one time on this machine. The "Cleveland" single spindle automatic has a turret or carrier which will hold five tools. This machine also has a cross slide with forming and cutting-off tools. When set up for making pins it has one tool and a stop on the tool carrier. In the first position, the bar stock is fed through against the stop, after which the tool turns the pin and the forming tool on front of cross slide forms the head. The last operation, or cutting off, is performed by the tool on back of the cross slide. This machine.

of course, is capable of producing a large variety of work and is tooled up accordingly.

#### Secondary Operations.

In the manufacture of the screws and pins, etc., the primary operations are performed on the automatic machines. There is still, however, more work to be done on them before they are finished, such as slots to be made and burrs removed, and, in some cases, holes drilled. These secondary or finishing operations are performed on a number of machines installed for the purpose, and include those for facing, grinding, polishing, burring, milling, and drilling. For performing the secondary operations the following equipment is installed, there being also included tools of minor importance for making bolts, etc. Some of these tools have also been used in making primers in which case they had special attachments designed for the purpose. Drill presses were supplied by Henry & Wright, Hartford, Conn.; Cincinnati Pulley Machine Co., Cincinnati, Ohio; The Sipp Machine Co., Paterson, N.J., and the Perfect Machine Co., Galt, Ont.; a tapper by the Garvin Machine Co., New York; nut threading machine by the National Machinery Co., Tiffin, Ohio; stud machine by the Foster Machine Co., Elkhart, Ind.; small screw machine by Pratt & Whitney, Hartford, Conn.; stud machine by the T. M. Smith Machine Co., Grand Rapids, Mich. There is also a "Sterling" hack saw machine and a centrifugal oil extractor.

One machine of particular interest was designed by the Galt Machine Screw Co. for facing stud and bolt heads. This machine has five spindles in a row, each having a collet chuck for holding the studs. In front of the machine are five rocking arms, one in front of each chuck, each holding a tool for facing the stud

A close view of one of the heavy four-spindle automatic machines with the oil guard removed to show system of tooling. These machines are used for the production of all kinds of standard cap and set screw work, as well as a multiplicity of other automatic products, four bars being worked on simultaneously.

Illustrating one of the Steel Storage Racks.

head. The arms are operated by cams on the back of the machine and work in succession, permitting the operator to remove each stud when finished without stopping the machine.

#### Tool Room.

The tool room is an important feature of the plant, as the desired accuracy can only be obtained by using properly designed and accurate tools. The company make practically all their own tools and fixtures in order to ensure the high degree of accuracy required in the manufacture of their product. The machinery installed in tool room consists of a Brown & Sharpe miller, and "Excelsior" 20-inch drill press; a Cincinnati Univer-

sal grinder; a tool room lathe by R. McDougall, Galt; a Blake & Johnston drill press, and a Stewart gas furnace supplied by the Chicago Flexible Shaft Co., Chicago.

The heat treating plant adjoining the stock room is well equipped and modern in every respect. The principal equipment installed consists of Rockwell, and Tate-Jones furnaces, using natural gas. The electric hydrometers installed are of "Tycos" make.

#### Percussion Primers

The manufacture of percussion primers, although a secondary consideration as far as this company was concerned, was an easy matter to accomplish, as the

greater part of the equipment required for such work was already installed. They have completed a large order, and are now confining their energies entirely to the production of their regular product, viz., machine screws.

The primer comprises six parts—the body, anvil, plug, disc, copper ball and percussion cap. The body is made from 1 7-16 in. round brass bar stock, the first series of operations being performed on a Gridley 1 3/4 inch multiple spindle automatic machine. The other parts are also made of brass, with the exception of the copper ball. The initial operations on the automatic machines are performed in the following order:

The first operation consists of forming the outside and rough drilling the inside, the forming tool being on the front of the cross slide and the drill on the spindle tool carrier. At the second position the outside is finished by a tool on the carrier, while at the third position the external diameter is threaded. At the fourth operation the inside bore is finished by a reamer on tool carrier, and the cutting-off tool on the back cross slide finishes the work on the automatics. After cutting off, the bar stock is fed forward for the next primer.

On the Cleveland automatic single spindle machines, the sequence of operations is practically the same. The bar stock is fed through to a stop on the tool carrier. The carrier then moves round to the next position, and a combination fixture rough turns the outside diameter and drills the inside. At the third position a similar fixture finishes the body, both inside and outside. At the fourth operation the outside thread is cut by a die on the tool carrier. The cutting-off tool is on the front of the cross slide. After leaving the automatic machine, the primers are washed and inspected. The ends are then faced on a Pratt & Whitney hand screw machine. The next operation consists of milling the key slots in the base in a Brown & Sharpe hand milling machine, which is equipped with a special indexing fixture. The following operation is reaming the tap hole and the smaller hole in the base on a Henry & Wright two-spindle drilling machine carrying a combination reamer. The small hole is then tapped in a Garvin tapping machine. The percussion cap hole is next finish reamed. This is done on a Sipp drill, using special fixtures. The next operation is hand chasing the outside threads, after which the base is stamped and the primer washed in a solution to remove the grease. It is then inspected and placed in an electric oven at a temperature of 160 degrees for about 15 minutes, after which follows the lacquering process. At this stage there is another careful inspection.

Close view of one of the heavy types of automatic turret lathe. These machines are capable of producing highest grade heavy work with extremely fine limits of tolerance, and lend themselves to the production of automatic parts which would be difficult to produce on machines less rigidly built.

Tool room equipped with the most modern appliances for the production of high-grade and accurate tools required by the various machines.

**Anvils**

The anvil is made from  $\frac{3}{8}$  in. round brass bar stock, most of the operations being performed on a Brown & Sharpe automatic screw machine. The sequence is as follows:—First operation stock is fed to a stop. The second tool on turret bores the hole, while a forming tool on front of cross slide forms the dome on the anvil. The outside threads are then cut, after which the cutting-off tool parts the anvil from the rod. A clever device is attached to the machine, which lifts the anvil after being cut off and holds it while the burrs are being removed.

The next operation on the anvil is slotting, which is done on a Pratt & Whitney screw machine fitted with a special fixture made at the plant. The

anvil is held in a collet chuck, while a rotary cutter forms the slot. The machine is fitted with a device working on a trip for tightening the anvil, and also ejecting it when the operation is completed. The fire holes, three in number, are drilled in a Cincinnati Pulley Machinery Co. drill press, equipped with a special indexing fixture, also designed at the plant.

**Plugs**

The plug is made on a Brown & Sharpe automatic screw machine from  $\frac{3}{8}$  in. round brass stock, the order of operations being as follows:—Feed bar to stop, then form and cut the groove. The thread is then cut and the plug cut off. This machine also has a burring attachment. The fire holes in the plug

are drilled in the same machine as the anvils, but a different fixture is used. In the anvil the holes are drilled at an angle, whereas in the plug they are parallel.

**Discs**

The closing discs are punched out from a brass strip on a Brown, Boggs Co. press. They are then cupped on a Pratt & Whitney screw machine, during which operation the disc is held in a special chuck with the cupping tool in the turret. After being cupped, the discs are annealed, then slit and closed back on Brown, Boggs punch presses. The discs are next inspected. The percussion cap is made of brass in a small punch press, a combination blanking and cupping punch and die being used. The ball is made of soft copper, and is purchased outside.

Inspection forms an important feature in the manufacture of primers, as a high standard of workmanship and accuracy is required. It is, therefore, necessary, in order to check any possible errors during the various operations, that the various parts should be inspected at different stages of manufacture. The final inspection is very rigid, and is conducted in a department set apart for that purpose. Although the majority of the machine tools installed are of standard type, practically all the tooling fixtures and special jugs were designed and made on the plant. It is in this feature perhaps that the chief interest lies and contributed largely to the success attained by the product of this plant.

**CANADA'S FIRE LOSS A NATIONAL HANDICAP**

IT is perhaps not fully realized by all the advocates of foreign trade expansion that Canada, by reason of the enormous proportions of her fire loss, will find it increasingly difficult to meet the competition of lower-priced labor in Europe. A contributor to *Conservation* for October, calls attention to the excessive cost of fire protection in this country and the manner in which it is bound to retard that future development now so hopefully looked forward to:—

The fire loss of Canada has reached enormous proportions. The drain upon her financial resources constitutes an economic loss which no country can afford and still meet competing nations on an equal footing. The war has had far-reaching effects upon commerce. European countries, in greater or less degree, are realizing their latent powers, production is being speeded up, resources are being developed, trade openings are being sought and established. Prior to the war, Canada found herself handicapped in any scheme of trade expansion by the lower cost of production in Europe. It therefore follows that, with the realiza-

Close view of one of Cleveland type automatic machines. The tooling illustrated was for the production of primers, one of which is shown in the chuck, finished ready to cut off.

tion by European countries of their commercial possibilities, this trade handicap will be greatly accentuated.

On the basis of averages, and from the data available as to the cost of insurance and upkeep of fire departments, the following comparisons may be deduced:—

For the past three years the average rate for fire insurance in Canada has been \$1.18 per \$100 of insurance. The average rate in Sweden is .40, in Austria .30, in England .23, in Germany .22, in France .21, in Spain .19, in Italy .19.

A Canadian employer of labor with 100 employes, carrying an insurance of \$50,000 on plant and buildings, and, assuming that \$2,000 insurance is carried or paid for by each employee on furniture and dwelling—or a total of \$250,000—would, on the foregoing basis, have to provide in wages and overhead charges \$2,950. His competitor in Sweden would only require \$1,000, in Austria \$750, in England \$575, in Germany \$550, in France \$525, in Spain and Italy \$475.

For upkeep of fire departments Canada is heavily taxed in comparison with competing countries. In 1914, Paris, France, with a population of 2,846,986, had a total fire department expenditure of approximately \$656,479, or 23 cents per head. Toronto, for the same year, with a population of 470,144, spent \$675,146 on her fire department, equal to \$1.43 per head.

The Toronto manufacturer—and this is only an example for all Canada—has to provide for himself and family and for each employee and his family \$1.43 to cover fire department costs, as against the 23 cents his Paris competitor must provide; or, with an average of five to a family, for his 100 employees, he would have to pay in salaries and wages \$722.15 as against \$116.15 by his European competitor. For insurance and upkeep of fire department the Toronto employer of 100 hands, as representative of Canadian industry, must pay \$3,672 against \$641 in Paris, a handicap equal to \$30 per employee.

The Census Report of 1911 gives 515,203 as the number of employees engaged in manufacturing in Canada; consequently at \$30 per head, there is a handicap of \$15,456,090 against Canadian manufacturers in the cost of fire insurance and municipal fire departments. The salaries and wages paid to these 515,203 employees amounted to \$241,008,416, an average of \$467.80, or approximately \$9.00 per week. The foregoing handicap of \$30 per employee represents the wages for 3.3 weeks of each employee.

In 1910 the products of Canadian manufacturers were valued at \$1,165,975,639. This charge for insurance and municipal fire protection therefore represents an added tax of 1.3 per cent.

upon Canada's entire output of manufactures. The fact that much the larger portion of this amount is buried in the pay-roll can be accepted as the reason why our employers have given so little attention to the question. The charge must be met, however, whether by direct or indirect means.

Employers complain of the rising cost of manufacturing; employees complain of the rising cost of living and demand increased wages. In view of the foregoing, employers should seriously consider reduction of the burden imposed by the enormous destruction of our created resources by fire—that their earnings may not be reduced by these charges and thus remove one of our heavy handicaps before Canadian employers and employees meet world competition under the new trade conditions which will develop after the war.

#### DEATH OF CAPT. F. R. NEWMAN

THE death of Captain Frank Ross Newman in London, England, on October 23, as a result of wounds received in action,

THE LATE CAPTAIN FRANK ROSS NEWMAN.

will be received with regret by a wide circle of friends. Capt. Newman was wounded on Sept. 28th on the Somme front and was progressing favorably, until tetanus supervened, resulting in his death. He had previously been invalided to England suffering from trench fever, but recovered, and was able to return to duty. Capt. Newman was born in Montreal in 1879, and was educated in that city, graduating from McGill University.

He started his business career with Caverhill, Learmont & Co., wholesale hardware, Montreal, his father, Thomas H. Newman, now deceased, being a partner in the concern. In course of time he left this firm, and went to Winnipeg to open a branch office for the Canadian

Fairbanks Co., being appointed manager. He eventually resigned this position and joined the staff of the Laurentide Paper Co., at Grand Mere, Que. In 1911 he returned to the Canadian Fairbanks-Morse Co. as manager of the Toronto sales office, which position he held until the autumn of 1914, when he resigned upon being appointed to a captaincy in the 19th Battalion, C.E.F.

Soon after coming to Toronto in 1911, Capt. Newman joined the Queen's Own Rifles as a lieutenant, and was an officer in that regiment until his appointment as captain and quartermaster of the 19th Battalion, which went overseas in the spring of 1915.

The deceased was unmarried, and is survived by his mother, who lives in Montreal, and also by two brothers, Capt. Harry Newman, of the 5th Royal Highlanders, and John Newman, manager of the Montreal branch of the McClary Mfg. Co. His only sister married Capt. Gurd, Canadian A.M.C., who is now on active service. His mother sailed for England just before the arrival of the cablegram announcing her son's death.

Capt. Newman was as keen and efficient as an officer as he was in business. His kind and genial disposition endeared him to all with whom he came in contact. He was a man of peace, but died loyally serving his country. The remains will be sent to Montreal and accorded a military funeral.

#### B. C. LUMBER OUTPUT

THE timber returns for August, issued by the Forest Branch, show the total scale of saw-logs for the province to be 107,843,857 feet B.M., in addition to 257,589 lineal feet of poles and piles, and 26,635 cords of shingle bolts, posts etc.

The returns according to forest districts are as follows:—Vancouver, 73,313,384 feet saw-logs, 62,430 lineal feet poles, etc., and 3,215 cords of bolts, ties, etc.; Cranbrook, 12,855,604 feet saw-logs, 20,330 lineal feet poles, etc., and 7,715 cords of posts, bolts, etc.; Island, 12,411,953 feet sawlogs and 209 cords bolts, ties, etc.; Prince Rupert, 4,378,017 feet sawlogs, 47,083 lineal feet poles and piles, and 60 cords of bolts, posts, etc.; Kamloops, 2,920,687 feet sawlogs, 114,582 lineal feet poles, etc., and 3,215 cords of posts, bolts, etc.; Vernon, 177,157 feet sawlogs; Hazelton, 83,184 feet sawlogs; Lillooet, 9,538 feet sawlogs and 11,282 lineal feet poles and piling; Fort George, 8,344 feet sawlogs, 1,882 feet poles and piles, and 100 cords of posts, etc.

Timber sales made during the month of August cover an estimated total of 21,844,000 feet sawlogs, 13,250 lineal feet poles and piling, and 498 cords of shingle bolts, posts and cordwood, to produce an estimated revenue of \$34,929.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data  
and Ideas Evolved from Actual Practical Application and Experience

## WEIGHT ADJUSTING GAUGE FOR SHELLS

By John S. Watts.

THE sketch shows a gauge used for indicating the maximum amount of weight that may be machined from the base of a shell without reducing its length below the minimum.

To use the gauge, the shell is first weighed in the usual way to determine

their machines, due to the creep of the belt from one position to another. This may be caused by faulty belting or shafting out of alignment. However, in many instances the trouble originates through the action of the shifter, especially where the wooden stick makes a great angle with the perpendicular, the weight being sufficient to overcome the friction of the various joints; thus the heavy

GAUGE FOR ADJUSTING WEIGHT OF SHELLS.

the number of ounces it is overweight. Then the gauge is placed on the shell and a scale laid across the base will indicate the ounces which may be removed and still not get the shell short for length. If the overweight, as shown by the weighing, is, say, 10 ounces, and the gauge indicates that only 8 ounces can be removed from the base, we mark 8 on the shell as the number of ounces to be faced off the base end, and the other two ounces are removed later from the inside of the shell.

On the other hand, if the gauge showed, say, 12 ounces as removable from the base, we mark 10 on the shell and face off the whole 10 ounces from the base.

To make the gauge, the length A is made to the minimum length of the shell, plus about 1-64 in. for tracing up the base after riveting in the base plug. The length B of the gauge is made equal to that length of the shell which will weigh 32 ounces (or such other amount as may be preferred), and the slanting end is divided into 32 equal divisions, each of which will then represent a weight of one ounce in the length of the shell over the minimum length and hence removable if necessary.

The idea of making the divisions on the slant is to have them sufficiently far apart to be easily readable.

## BELT SHIFTER TROUBLE

By J. H. R.

MACHINE operators are often annoyed by the gradual starting or stopping of

stick seeks to return to a vertical position, with the result that the belt is forced over to the adjacent pulley. In an effort to remedy this trouble, a foreman in a small shop adopted the method shown in the sketch, where the belt shifter stick remains in a vertical position, after the machine has been started or stopped. Instead of the stick being pivoted to the shifter rod, it is allowed to swing freely in a slotted bracket A, which is fastened to the rod upon which the shifting forks D-D are secured. When hanging free, the stick is always perpendicular as shown at C; the position B (to the right or left) being so after shifting the belt. After the belt has been shifted, the stick will return to a vertical position, so that whether you are starting or stopping the machine, the belt stick will always be in the same

BELT SHIFTER TROUBLE.

position. The length of the slot will equal the width of the stick plus the distance (x); the latter being equal to the space (y), or the side movement of the belt in its passage from one pulley to the other.

## STRAIGHTENING SMALL PERFORATING PUNCHES

By J. Hamilton.

WHEN making perforating dies for light sheet metal, it is often found that several of the punches will incline a little from the perpendicular, owing to a slight bend in the wire or to the drill having run when drilling the punch pad. In order that the punches will enter the die or allow the stripper to slide freely, they must be at right angles to the pad surface; it is, therefore, necessary that bent or inclined punches should be straightened. Where the fault is in the punches themselves, they can be replaced by new ones, but where the cause is in the pad, the pin must be bent to straighten it up. If the punches are soft, they can be easily bent, but care must be taken to have the bend come close to the pad.

A very handy tool for this purpose is shown at C. This can be either a piece of cold-rolled stock or a piece of stub steel, with a hole drilled in one end slightly larger than the punches, and deep enough to clear the end, as shown

STRAIGHTENING SMALL PERFORATING PUNCHES.

in the sketch. If the punches are hardened, it may be better to force them over by peining the pad, as shown at A, by means of the tool B which, instead of being used as a lever, is struck with a small hammer, the high point being forced into the metal at the base of the punch; thus bringing the latter over the desired amount. The point of the tool B should be hardened and tempered.

## ROUGH, BUT SERVICEABLE GRINDER

By R. James.

OCCASION often arises in small jobbing shops, where it is necessary to use a grinder to finish hardened work, and, as many of such plants are not provided with electric grinders, the device used for the purpose is generally one of home-

made construction. The sketch herewith shows a simple but serviceable grinder, used in a shop where sheet metal dies are made and repaired. The main casting A, which carries the shaft, is designed to secure good long bearings, the front one being extended to allow of operating on

ROUGH BUT SERVICEABLE GRINDER.

internal surfaces. For bores of small diameter, shaft extensions are screwed to the main shaft. The height (e) is made to conform to that of the smallest lathe on which it may be used, while distance blocks D are provided for use on the larger machines, the height (f) being such as to raise the centre of the wheel to the level of the lathe spindle. Lateral play is eliminated by means of the adjusting nuts E.

## PROTECTING TUMBLING BARRELS

By D. O. B.

IN many factories the proper guarding of tumbling barrels is not given the necessary attention which the conditions demand. Many cases might be mentioned in which accidents have happened in this connection. In the cut is shown the method of protecting tumbling barrels as employed in one large agricultural plant. These guards are constructed of one-inch pipe with ordinary woven wire across the upper halves. They are merely dropped into holes in the floor and held by flat braces attached to the pedestals. These guards are extremely effective, and prevent anyone coming in contact with the moving barrels, yet at the same time being readily removable.

GUARDS MADE OF WOVEN WIRE AND PIPE FOR PROTECTING TUMBLING BARRELS.

## A SCREW MACHINE TOOL

By D. S. Mann.

HAVING to machine a large number of cast-iron pieces of the shape shown in Fig. 1, it was decided to put the job on a small screw-machine. These pieces were drilled and reamed, faced on the end and turned on the outside for a short distance from the end in order to give a finished appearance when assembled. The pieces were chucked and all the operations with the exception of reaming performed with the tool shown in Fig. 2. The drill was held in the regulation manner in one of the turret holes and the tool clamped directly on the drill body. This was a steel casting, split and provided with a screw for clamping. The two projecting lugs each carried a tool which completed the turn-

FIG. 1.—PIECE FOR WHICH TOOL SHOWN IN FIG. 2 WAS DESIGNED.

ing on the outside, these tools coming into action when the drill entered to the requisite depth. After turning off the

FIG. 2.—TURNING TOOL CARRYING DRILL USED ON SCREW MACHINE.

outside, the feed was thrown out and the end faced with the two tools set directly into the body. This then com-

pleted the three operations in the time ordinarily required for the drilling. The same tool could just as conveniently be used in the drill press. Oftentimes large bosses occur on castings where it is impossible to turn them on the outside in any other way.

## MOULDING AN ANGLE IRON FORMER CASTING WITHOUT A PATTERN

By J. H. Eastham

A RUSH order for a number of 24 inch diameter angle iron rings of 1 inch by 1 inch by 3-16 inch section necessitated the provision of a former casting of dimensions and shape as shown at Figure 1, the order for this casting being handed over from the

blacksmith department to the foundry at four o'clock in the afternoon, with a request that the piece be delivered the following morning without fail. Obviously, at that late hour, time to make a pattern, except of the crudest type, was out of the question, hence the introduction of the material and means of production described herewith.

## Preparatory Operations

A circle 24 1/4 in. dia. was marked out on the smithy floor, and a piece of 2 in.

by 1/4 in. flat was heated, its outside face bent to the radius just described as accurately as possible, cut off at twenty inches long from tip to tip, cooled, and handed over to the foundry foreman. Meantime a bed had been leveled and struck off on two straight-edges 24 in. long, and placed 18 in. apart, while a wooden wedge A, Fig. 2, was driven in level with the surface at the point indicated to serve as a support for one end of the trammels which are now employed to mark the outer radius

FIG. 1. PARTICULARS OF FORMER BLOCK TO BE MOULDED.

as shown. This radius was 12 1/8 in., the extra 1/8 being contraction allowance.

The wedge was now withdrawn, moved back three inches to position B.

and again driven in to act as centre for a curve of the same radius which is drawn out on the bed to mark off the inside surface of the casting.

FIG. 2. IRON HOOP IN POSITION FOR RAMMING UP.

### Ramming the Hoop Iron

The hoop iron segment was now laid on the bed, its outer face touching the outer circle as in Fig. 2, rammed up on the outside only and then drawn forward till its inner face touched the circle struck from wedge B. Sand was then rammed to its inner surface, and strickled off level, the hoop being next finally removed, leaving a mould which, after the ends were stopped in by the aid of a 2 in. flat strip, measured 20 in. long over all, 2 in. square at each end, and 2 in. deep by 3 in. wide at the centre. The extra thickness at that point was desirable, as that particular place the

FIG. 3. SECTION OF RAMMED MOULD.

former block would naturally receive the maximum number of blows with consequent tendency to fracture, if of too light a section. The mould at this stage and previous to withdrawal of the hoop pattern is shown at Fig. 3, both radii being shown at the end or 2 in. square section of the casting.

### Cutting and Coring Lugs

The lugs needed to secure the former block to a foundation plate whilst in use were next cut out with trowel and cleaner, being approximately 2 in. by 2 in.

FIG. 4. SECTIONAL VIEW OF MOULD READY FOR POURING.

across, and 1 in. deep, and heavily filleted on their under and outer junctions with the main casting, a coreprint  $\frac{3}{4}$  in. dia. being next sunk in the centre of each.

Pieces of  $\frac{3}{4}$  in. round stock core were now sawn off to the required length, and pushed down till level with the joint, the holes formed by these cores being intended to accommodate  $\frac{5}{8}$  in. bolts, which, along with the size and location of the lugs were considered ample to secure the greatest degree of rigidity whilst in use.

Slabs of core, one inch thick were now filed to fan shaped sections to suit the circular mould and placed end to end in the form of a cover, one being pierced with a one inch round hole to facilitate pouring.

These cores, with pouring arrangement, are shown in the cross sectional view of the finished mould Fig. 4, as well as in plan in the composite view Fig. 5.

FIG. 5. PLAN VIEW OF MOULD SHOWING SLABS OF CORE.

### Forming Cope and Pouring

Sand was now rammed lightly round the entire mould and the slab cores, up to their upper surface, and struck off to a level joint, and a 24 in. by 12 in. cope part was rammed up over the whole, to prevent displacement of the cores when pouring. The mould was then weighted and cast, well inside the stipulated time, a little grinding of the marks caused by the core joints being the only treatment the casting required after rambling.

### DRILL JIG FOR SMALL SHELLS

By R. E. N.

THE accompanying sketch illustrates a useful jig for drilling the small grub

DRILL JIG FOR SMALL SHELLS.

screw hole in the noses of the shells. The pocket in the piece A is bored out to fit the nose of the shell, and the hole for the drill bush B located in the desired position. The vee block C is shaped out

so that the centre line of shell will be parallel with the base of the jig. The lug D is tapped out to receive the screw E upon which the wheel F is secured. The operation is rapid and very satisfactory.

### THE COST OF MUNITIONS

IN the first and second reports from the Committee of Public Accounts, under the heading "Vote for the Ministry of Munitions of War," particulars are given with regard to the cost of shell, from which it appears that this has now been reduced from 25 to 30 per cent., compared with the prices paid during the early period of the war. It appears that whereas the cost of the 18-pounder bodies was formerly from \$4.86 to \$5.61, the price has now been cut to \$3.04. The prices for 4.5 shell ranged between \$11.40 and \$15.80, and these have now been cut down to \$8.10. Sixty-pounders that formerly cost from \$15.35 to \$20, are now cut down to \$12.75. The 6-in. shells which cost from \$19.44 to \$24 formerly, are now being made for \$17; the 9.2-in. shells which now cost \$55.28, formerly cost from \$63.80 to \$74.10. As complaints have been made that the Ministry of Munitions did not appear to deal equitably with the small producers of shell, it is interesting to note that an attempt has been made by this department to regulate, to some extent, the prices paid in inverse proportion to the output; that is to say, the prices paid to the smaller makers are somewhat higher than those to the larger producers.

A range of prices was fixed by the department running from the works producing 200 per week to the firms producing 2,000. The 200 per week shop was cut to \$3.90, and the 2,000 per week shop to \$3.40 on the 18-pounder shell. For quantities over 2,000, contracts are made as low as \$3.05. With regard to the 4.5 Mark V. shell, makers of not more than 200 per week received \$11.20 per shell body, while contractors for 1,500 per week were paid \$9.50. In these cases the forgings were supplied by the Ministry to the works at a specific price. The 4.5 in. shell forgings were charged at the rate of \$4.35 each. As the forgings were bought at \$3.15, the Government was getting a set-off of about \$1.20.

It appears from the evidence given by S. H. Lever to the committee, that these new prices have been fixed as a result of a system of costing in the national shell factories, from which a monthly return in detail of the cost of each shell is furnished. The cost covers labor, material, and all overhead expenses, except depreciation of plant and interest on capital, and in many cases where services are given free. The management salaries are not included.

# Machine Shop Equipment, Methods and Processes -- III.

By E. R. Norris \*\*

*Since recent events have demonstrated so strikingly the reliance which must be placed by a nation on its engineering industry as a factor in modern warfare, the subject of the above title assumes a place of importance not previously awarded it by people in general. While not dealing specifically with munitions or other similar product, the application of the principles contained therein may be done with profit in all branches of engineering.*

**S**INCE Mr. E. G. Acheson produced the substance known as Carborundum, about twenty-five years ago, investigators and manufacturers of abrasives have given great attention to the grain, grade and bonding of their products, with the result that to day we have abrasive wheels and discs of emery, Carborundum, Aloxit, Alundum and Crystolon in great variety of size, shape, grain and grade, of superior quality, and adapted to a wide range of service.

The demand for accurately finished parts of machinery at a low cost has been largely responsible not only for the development in abrasives, but also for the great improvement in grinding machinery. Since manufacturers of machinery began to realize that abrasive discs and wheels were truly cutting instruments, in which innumerable cutting points and edges were presented to the work, much work that was previously performed on millers, planers and lathes has been transferred to the grinders.

## Dry Disc Grinding Versus Milling

Considerable saving is being effected by the use of disc grinders on many flat surfaces that were formerly milled. This is more noticeable in dealing with castings that are liable to be chilled and brittle. Grinding also possesses decided advantages where the shape of the casting or forging is such that, in order to prevent springing, great care is necessary in chucking or clamping the work in the milling machine.

Motor driven, double disc grinders are in use, in which the discs are of steel, 23 inches (584.2 mm) diameter and running at 1450 revolutions per minute. The abrasive circles are glued to the discs by a cold glue, which is readily soluble in water. When the abrasive circle becomes somewhat worn, it may be used on the corners or edges of work or upon work which presents surfaces of comparatively small area, and when worn out, the abrasive circle may be removed from the steel disc by immersion in a tank of warm water. As disc grinders of this kind are invariably dry grinders, they must be connected up with a dust

extracting system, and on account of the dust, it is not considered good practice to install these machines near other machinery.

In another type of disc grinder, two constant-speed motors are used, one of which is fixed on the bed, while the position of the other is adjustable along the bed by means of rack and pinion. The spindle of this latter motor, together with its grinding disc, is adjustable in a longitudinal direction and may be controlled by a micrometer stop. By this means, work having parallel surfaces may often be rapidly and accurately finished.

## Use of Ring Wheels.

Instead of the abrasive circles mentioned above, ring wheels may be used with advantage for roughing off scale

Another form of dry disc grinder has a disc 48 inches (1.219 metres) diameter which rotates at the rate of 400 r.p.m. in a horizontal plane. This machine represents the most recent addition to the family of dry disc grinders, and is remarkably efficient on certain kinds of work. Its chief peculiarity lies in the fact that the work bears directly on the abrasive and is ground by the pressure exerted by its own weight, hence, frail castings which are difficult to machine on the milling machines because of the tendency to spring while being clamped, may, in many instances, be faced truly and economically by this process, which requires comparatively unskilled labor. Figure 3 is taken from castings which have been faced by the horizontal grinding process, and the following table shows the savings due to this method.

Name of Piece.	Operation.	Time on Milling Mach.	Time on Grinder.	Time Saved Each Piece.
J-Junction Box, "A"	Face	16 min.	2 min.	13 min.
Controller Base, "B"	Face Bosses	10 min.	3 min.	7 min.
Half Bearing, "C"	Face Joint	7 min.	1½ min.	5½ min.

and stock which is too rough to be ground economically by abrasive cloth circles. There is another advantage possessed by the ring wheel, in that the life of the wheel is much longer than that of the abrasive circle. The case of the grid cited above furnishes a good example of the relative wear of circle and wheel. Wheels of 15-inch (381 mm) outside diameter, 9 inch (228.6 mm) inside diameter and 3 inches (76.2 mm) thickness were used instead of abrasive cloth

## Wet Grinding.

For the production of true flat surfaces on hardened-steel punches and dies, the vertical surface grinder has been found highly efficient. A cup-wheel 16 inches (406.4 mm) in outside diameter, running at a constant speed of 1000 r.p.m. is used. The work is held and presented to the wheel by means of a strong magnetic chuck, which forms the machine table; this latter has six different speeds of rotation. The feed

FIG. 3. TYPICAL SAMPLES OF WORK FACED ON HORIZONTAL GRINDING MACHINE.

circles, and it was found that each wheel was worn down 1-16 inch (1.59 mm) on the face after one month's work; whereas, two abrasive circles are usually worn out by 4 days' work.

mechanism is so graded as to allow of feeds ranging from 0.0002 inches (0.005 mm) to 0.005 inch (0.127 mm) in increments of 0.0002 (0.005 mm). A sheet iron guard surrounds the wheel, and

\*\*Director of Manufacturing Operations, Westinghouse Electric & Mfg. Co., East Pittsburgh.

splash guards prevent the cutting compound from being thrown beyond the machine.

Much of the work now done on the vertical machines was formerly done on grinders of an old type, having horizontal spindles and cylindric wheels. The

stock which has been allowed for grinding. This allowance varies considerably in different machine shops according to the class of work, the condition of the roughing lathes and the inspection of the roughturned shafting. In general, however, the amount allowed for grind-

FIG. 4. SLAB-GROUNDING A SHAFT 1½ IN. DIA. X 30 IN. LONG.

superiority of the vertical machine is due chiefly to the adjustable feeds and speeds, also to the method of chucking and face contact instead of line contact of the wheel.

In the up-keep of wheels, the vertical grinder costs five times more than the obsolete horizontal machines mentioned above, but since the vertical grinder produces from 50 to 75 per cent. more work, the wheel cost per die is very little more. On small dies, having surfaces up to, say 3 inch by 6-inch (76.2 by 152.4 mm), the saving due to the vertical machine is about 75 per cent.; on large dies up to 30 inch (762 mm) dia. (the maximum capacity of the machine), the saving is about 50 per cent.

#### Cylindric Grinding.

The finishing of cylindric surfaces on cast iron and steel by grinding has been a well established machine shop process for many years. It is common practice on shaft grinding up to 6 inches (152.4 mm) diameter to use wheels of 2 inches (50.8 mm) face, and to give a work traverse of from ½ to ¾ of the wheel width per revolution of the work. With the correct combination of work and wheel speeds, wheel grain, grade and materials, each pass of the wheel, when roughing, may remove from 0.003 to 0.004 inches (0.076 to 0.102 mm) from the diameter of the shaft. At the end of each stroke, or pass, the longitudinal movement, or traverse, is suspended, while the work makes from one to two revolutions. The total number of passes required to rough grind any fit, therefore, depends on the amount of

ing depends on the diameter and the length of the work and tables have been constructed which give this allowance for any shaft of given diameter and length. From what has just been said, it is evident that a considerable reduction in grinding time may be effected by increasing the width of wheel. In the latest development of cylindric grinding, which someone has called "slab-

bing," the advantages of the very wide wheel are obtained. This new method appears to have possibilities which are limited only by the width of the grinding wheel and the rigidity of the machine. Fig. 4 shows the application of the "slabbing" process to a 1.4 inch (35.56 mm) diameter by 30-inch (762 mm) long shaft; from which it will be seen that, with the exception of one fit, the wheel exceeds the length of each shaft fit. By this means, the end traverse of wheel or work is in a large measure eliminated, and a corresponding decrease in grinding time realized.

#### File Sharpening.

Although for a number of years attempts at file sharpening have been made, it is only within the last few years that the process has become a

commercial success. A sand blasting apparatus is being used for file sharpening, with success, by several large manufacturing establishments. This apparatus consists of a sheet-iron chamber provided with uptake, settling tank, slurry mixing-tank, slurry overflow-pipe, air agitating pipe and slurry projector. A door gives access to the inside of the chamber. The slurry projector is inclined to the horizontal at an angle of 25 degrees, and the nozzle extends slightly within the chamber. This projector consists essentially of a bronze body to which are fitted steam pipe, slurry suction-pipe and nozzle. The steam supplies sufficient water for the slurry.

The files are sharpened by being held in the slurry jet in such a manner as to expose the backs of the file teeth to the cutting action of the sand. After the file has been sharpened, it is cleaned and dried by the steam, after the slurry supply has been cut off by a foot lever.

Success in file sharpening depends on the skilful selection of the files to be sharpened, maintenance of the correct angle between files and jet while sharpening, and the selection of a suitable sand. Experience shows that a sharpened file often does as much work as a new one, and the cost of sharpening averages about one-fifth of the cost of new files. The following results have been obtained under ordinary manufacturing conditions and may be taken as representative of the economies which are effected by the efficient use of this apparatus.

#### Electric Driving of Machine Tools

That the electrically-driven machine shop possesses advantages, is evident from the rapidity with which electric driving has been substituted for mechanical driving. Among the advantages claimed for electric driving are the following:—

Power may frequently be obtained from a public supply corporation at a less cost than would be possible were it generated in a private power station. In such a case the first cost of a private generating plant is unnecessary.

When an electrically driven shop, having its own power station, is in the vicinity of a public supply system, power may be obtained for machine shop purposes when the private station is idle.

Where electric driving is used, the position of the power house may be de-

terminated by a convenient source of fuel and water supply and facilities for the disposal of ash; whereas, mechanical transmission usually makes a definite relation of machine shop and power house imperative.

Transmission shafts, counter shafts, fixings and belts, with their expensive delays and repairs, are eliminated. As a result of the elimination of belting, there is less obstruction to light.

Electrically driven machinery may usually be more easily arranged to suit the sequence of manufacturing operations, and where the machines are individually driven, any machine may be operated irrespective of others. Closer and more conveniently obtainable cutting speed regulation, with a consequent increase of from 15 to 25 per cent. in output, together with a great reduction of moving parts, is usually made possible by the substitution of electric for mechanical control of machine tools.

Great improvements have been made recently in the design and construction of machine shop electrical equipment. Motors have been reduced in weight and increased in mechanical strength by the substitution of pressed steel for cast iron and cast steel. Automatic starters and controllers have been improved and are now used to advantage on machines which are frequently started and stopped.

#### Advantages of Electric Control

Among the advantages secured by automatic control—sometimes called "push button" control—may be cited the following:—

Simplicity and safety in operation.

Speed regulation to suit the hardness of material to be cut.

Protection of motor from excessive starting current.

Protection of motor from overload.

Convenient location of the push buttons greatly facilitates the setting up of work on the machine. This feature is highly desirable for planers and boring mills. A very full description of automatic control for industrial motors may be found in the *Electric Journal* of December, 1914.

It frequently happens that existing machine tools may be readily altered and greatly improved by the substitution of electrical for mechanical control, as in the following case: A lathe, in which the work speeds were obtained through numerous spur gears, clutches, levers, and fittings, had caused considerable expense and delay due to repairs, and it was decided that a change from mechanical to electric control should be tried, as a possible means of reducing the repair bill. Fourteen spur gears, two double clutches and their levers and fittings were removed from the headstock and an adjustable speed motor and controller were installed. After the

change, instead of the nine original speeds, thirty-two were available under the new conditions. In addition to the advantages of closer speed regulation and reduction of wearing parts; an appreciable reduction in power used is recorded, and speed changes are obtained with less effort.

#### Conclusion

From what has been said with reference to modern cutting tools and machinery, it is evident that rapid advances have been made in machine shop methods and equipment; it is also a fact that the cost of equipment has increased greatly. Also, the first cost of buildings, with the superior hygienic conditions under which men work; the increased cost of management due to the more highly developed and complex manufacturing conditions and competition; and other items connected with the production of machinery, all combine to swell the total overhead factory expense. Under these circumstances, it is essential that a high state of efficiency be maintained in the machine shop, and this can be secured only when the machinery is kept running at or near its maximum capacity. There are many factors involved in the realization of this latter condition, not the least of which is the ability of the machine tool operator; and in order that the operator may work to the best advantage, it is now customary, in large organizations where a great many tools are used, to employ a staff of expert demonstrators, whose business it is to instruct operators and demonstrate the capabilities of machines. The demonstrator is also expected to keep himself abreast of the latest developments in this class of work, and to devise means for simplifying and improving machining operations. The paper read by Mr. G. O. Gridley, on "Safe Selling Guarantees" before the National Machine Tool Builders' Association, in the fall of 1913, brings out very forcibly the benefits to be derived by machine tool builders from the demonstration of the value of their machinery.

The buyer of machinery is naturally influenced by the design and workmanship in the tools offered, but, generally speaking, his final decision in making a purchase will rest upon the quantity and quality of the work which the tools will produce in a definite time and under working conditions which are conducive to a reasonably long period of usefulness and efficiency. Therefore, the machine tool builders who are in a position to study the requirements of their customers and to furnish data as to how work should be done and the time in which the work can be done, have decided advantages over those who do not render such service. The market now offers a great many competitive machines for doing practically the same

class of work, and it is not to be expected that the users can always accurately decide what is best for their requirements.

Before making a guarantee that a machine tool will perform a definite piece of work in a certain time, the builder of the machine should be in a position to demonstrate that the work can be performed in the time specified; otherwise, it is unsafe to make such a guarantee. Actual demonstration is convincing, and its influence as a selling agent is very far reaching. Demonstration provides a means of obtaining the most suitable arrangement of tools and the best combination of feeds, speeds, and cuts for the work in hand. During a demonstration, an itemized record, or time study, can be made of the operations, the material, the cutting feeds, speeds or cuts, the handling time and the time consumed in manipulating the machine. Such records, when conveniently filed, form a valuable source of information, which may be used to advantage when estimating the cost of similar work.

#### OFFICIAL BADGE FOR WOMEN WORKERS

WOMEN munition workers are to receive official recognition from the Imperial Munition Board, and with this end in view an official badge has been issued by the Board which will be given to each woman munition worker who has been engaged in the manufacture of munitions for thirty days. The badge is unique and of interesting design, showing a completed artillery shell in its cartridge case on a shield surmounted

OFFICIAL BADGE FOR WOMEN MUNITION WORKERS.

with a crown, and with scroll work carrying the words: "Woman Worker" and "Imperial Munitions Board," with "Canada" beneath. A feature of the badge analogous to the bars on military medals will be a service bar bearing the words, "six months' service," which will be attached below the badge, an additional bar being added for each six months of continuous work at one plant.

## CULTIVATING THE INITIATIVE

By A. E. R.

**N**O man should content himself with absolute subordination. Strict obedience is very often a highly desirable factor; but to carry it to extremes, at the expense of personality, is to sacrifice all self-respect and confidence in one's personal ability. Original thought and individual initiative have invariably been two of the greatest forces in the advancement of mankind; the first—whether visionary or the development of previous ideas—has always found expression in the latter, where an active brain and willing hand has been ready to put into concrete form the fruits of mental conception.

### Everyday Requirements.

Workmen should always be mentally alert; quick to see an opportunity where in their own and the firm's interests can be advanced. Because work has been performed in a certain way for a long period of time, is no reason that it should be accomplished in the same identical way indefinitely. While in the majority of cases, present methods of doing certain operations might not very well be improved on, there are many instances where a little thought, logically applied, would greatly increase the productiveness of a man or machine; often eliminating much labor otherwise uselessly expended.

A man's loyalty to the firm may be shown in the implicit way he follows the directions of his superiors, and yet he may be quite indifferent to efficiency possibilities that would be clear to a more receptive mind or observant eye.

### How Initiative Originates.

Concentration of thought upon the work in hand is the forerunner of a creative mind. While many trains of thought carry no freight, the essential factor is to keep the train moving, so as to be in a position to take on freight when the opportunity offers.

When men are enthusiastic about their work, their minds are alert, they are productive, prolific in ideas, original, creative, strong and effective. What hope of advancement is there for the man who can only answer, "I do not know"?

### Fruitful Criticism.

One of the best ways of cultivating the creative thought, is to study the methods of the other fellow; not with the purpose of adopting his ideas, but to

see wherein any particular principle may fit in with your own line of work, and at the same time become conversant with progressive and up-to-date equipment. Few workmen, however, have the opportunity of studying this development by actual observation, owing to the small circle in which their practical experience is confined.

### Trade Journals Helpful

The one best method for the isolated mechanic to obtain the current trade progress, is to avail himself of this privilege through the medium of the trade paper, which reflects in print the latest improvements of that particular field of industry. The careful and conscientious study of these pages broaden and train the mind to think out original and effective ideas for individual and collective benefit. The circulation of ideas among different shops stimulates thought all along the line.

### Discourage Discouragement

No man should be discouraged because his first attempt at original thought has not met the approval of his immediate superiors. Your proposal may even be resented, but do not get "cold feet," it is a weak man that cannot rise after being knocked down. The man that suggested floating iron boats was termed a fool; wireless telegraphy was laughed at when first spoken of; a railroad president had no time to waste with George Westinghouse when he wished to "stop a train with wind." So it has been with many new ideas that have afterwards proven beneficial to the human race.

Great achievements are possibly not open to everyone, but even the most insignificant improvement is often the first step towards higher and more important goals. Never before was there such a demand for the resourceful man; the man who can think, who can devise, and who can put his thoughts into execution.

## RECOGNITION OF ABILITY

By R. Hamilton.

ONE of the agents that tend to destroy the spirit of loyalty, is the lack of appreciation accorded for work well done. In many instances this reasoning does not apply; but where it does, the seed of dissatisfaction once planted, may ultimately grow up and stunt the growth of the surrounding grain. It is generally recognized that the foreman is responsible for the efficiency of his depart-

ment, and to maintain a high standard it is essential that the shop associations should be of such a nature, that the workmen can be relied upon to put forward their best efforts at all times.

### Men Are Not Machines

Men should not be considered solely as units of a productive force, for unless an essence of goodwill permeates the whole plant, loyalty to the firm will gradually disappear, and the value of the men will deteriorate. Treat a workman as your slave, and you will get from him sullen service; and a half-hearted service means limited and inferior production. Consider him as a co-worker; one whose efforts are not only satisfactory, but appreciated, and an important part of your high efficiency problem will be solved, so far as output is concerned.

### Need for Personal Judgment

It is the workman's privilege to improve his opportunities, and his superior's duty to see that he gets them. Men should be encouraged to use their own judgment in many of the minor details of their work. Profitable results are very often obtained by men "thinking" of their work in addition to doing it.

Although the foreman is nominally in charge of the shop, and ordinarily supposed to answer "shop" questions, it behooves all men to practice the analyzing of detail problems, the simpleness of which often try the patience of the best of foremen. And then again, there are men in authority who are so self-conscious of their own limited accomplishments, that they are reluctant to accept suggestions from the men under them. However, the world—at least the mechanical world—is making such rapid strides that no one man's past or present experience is so broad that he can lay claim to a monopoly of original thoughts or ideas.

### Ridicule Kills

Do not despise or ridicule the well-meant suggestion of an interested shop man. Nothing will "kill" a man quicker than to ignore his proffered aid in the solution of a shop problem. Ideas are sometimes advanced by the men in the shop for the improvement of certain tools or devices, which the foremen reject at the time and afterwards use with some small alterations; but the "powers that be" are under the impression that the saving is the work of the foreman and not the man.

### A Steal

A case is recalled where the foreman

actually "takes" the credit at the very moment the suggestion is offered. A thoughtful planer hand seeing where he could save considerable time by the use of a certain fixture, explained in detail his idea to the foreman. Just as the latter was convinced of the advantage to be gained, the manager comes along, and is advised by the foreman that, "I have just thought out a plan where we can make a saving of 25 per cent. on this operation." The device was designed and constructed, but it was the means of "killing" the real author, with subsequent loss to the firm. While cases similar to that just stated may be exceptions to the general rule, it is often these same exceptions that prove the undoing of some enterprising concern, "blessed" with a poor executive.

### Ability Seeks Recognition

Men who are keen to recognize their own ability, wish to have it appreciated, and if it is not, these men will invariably seek a position where it is.

Every worker in an organization whose aim is his own advancement and the welfare of the firm, is justly entitled to at least the moral recognition for any suggestion whereby the efficiency of the plant may be increased. To stimulate thought and promote the suggestive idea, every shop should have some organized system to induce the workmen to take an active interest in the economic handling of product and equipment. Money talks, and a small cash consideration for an adopted idea, is nearly always an incentive for future developments of an original nature.

### WORKING WITH A PURPOSE

By P. H.

SEARCHING for a job that entails the minimum expenditure of physical labor, for the greatest cash returns, is a trait common to a large number of present-day workmen; in fact, many of those who are now occupying such "coveted" positions spend much of their time in abusing the privileges with which they are surrounded. There is something demoralizing in trying to get through life without a struggle.

### Helping Others Helps Oneself.

To achieve success in any field of activity, the employee must realize, that while he is working for another, he is nevertheless in business for himself. Every bit of work he does heartily, honestly and thoroughly, is developing his own capacity, making him a bigger, broader, more capable man. Remember that cash remuneration is not the only returns you are receiving for your labors.

### Future Assets.

The knowledge that you acquire in the course of your daily "grind," is to be

one of the chief assets of the future; therefore, the value that is placed upon your services in after years, will not be, what you have done for your previous boss, but rather what you have learned and can apply profitably to the subsequent positions you are called upon to fill.

The seriousness of life should be impressed upon every young man during the early period of his career. No man should expect to journey through this life without having accomplished, during the passage, something worth while.

### Luck Versus Ambition.

That man is destitute of ambition who is content to drift along, passively, indifferent to those qualities that make for success. These men, as a rule, will look at the other fellow's advancement as a matter of "luck," never realizing that this good fortune is invariably the result of earnest application and eagerness to excel.

Luck is the tide, nothing more. The strong man rows with it, if it makes toward his goal; he pulls against it if it flows the other way. A man waited for 20 years for an opportunity to come along; becoming weary, he decided to take a nap, and while asleep the opportunity passed him by. A receptive mind, and an alert and creative brain, are the two goal posts through which opportunity scores a goal.

### Industrious Idlers.

Idleness, in any form, is not only the key to beggary, but it is cowardly; inasmuch as the portion of life's activity that one person endeavors to avoid must be taken by another. It may be alright to cry aloud that the world owes us a living, but let none of us appease our conscience by letting someone else pay the debt. While idleness is generally supposed to allude to an anti-work habit, this non-productive trait may be exercised during the periods of useful effort in the daily routine of the average man. Some men, knowing they have accomplished a certain job in extra good time, will spend the "saved" time in telling their shopmates about it. These men are not only losing the respect of their superiors but what is probably worse, they are putting sand into the foundation of their future character, the stability of which should be one of the first duties of every young man, as his best strength depends upon the materials used in its construction.

### Genius Discounts Itself.

A man of genius, one that is truly loyal to his self interest, invariably feels that what he has performed does not do credit to his aim or purpose; while on the other hand, the braggart is content to waste his own and his employer's

time by trying to convince others of his own importance.

"Some people, in their lives and in their labors,

Seem larger to themselves than to their neighbors."

No man should be satisfied with doing just what he is told to do and no more. He should strive to overcome the tendency of getting in a rut, out of which it is often very difficult to emerge. Men cannot remain stationary; in whatever sphere they are engaged, they must either advance or retrogress. If a man's fund of experience does not increase his skill and production improve, he must stand idly to one side while others pass him by. Every day should see something added to his store of knowledge, and likewise profit to himself and his employer.

### Control Effort.

The cause of many failures is not so much in the lack of effort as in the waste of it. A large amount of energy is often non-productive, where the same amount of inherent power properly expended might accomplish marvelous results.

Have courage to go forward. Don't be afraid to try, even if you fail; remember that a worm is about the only thing that can't fall down. Every earnest determination to remedy a failure or overcome an obstacle, makes the next trial just a little easier. If you cannot surmount a difficulty, take positive hold of it and make it serve you.

### ORGANIZATION AND SYSTEM

By A. L. Haas.

CARD indexes, routing memoranda, stores orders, shop orders in duplicate, triplicate, quadruplicate, of every kind and all colors of the rainbow, are the order of the day. In spite of these counsellors of perfection, jobs are delayed, stores may be wasted, and time at so much per hour does get unaccountably lost. It is clear that under no routine, however cleverly planned, can the human factor be eliminated or entirely disregarded.

Routine, system, bookkeeping are all self-acting machines, which should automatically care for some repetition details, and relieve the staff from wasting time. It is, however, easy to make a fetish of what is after all a tool, to regard system as an end in itself. When routine becomes master of the situation it is high time to adjust its incidence. There are present-day instances where foremen have so much daily red tape to wind that clerical duties occupy an inordinate time and impair the real functions of their position.

### A Frequent Weakness

Instead of system being an assistance with its literary aspect cared for by a

clerical staff, it frequently happens that the latter needlessly consult the shop executive and waste his time. Where the management place greater reliance upon filing cards and data than upon getting work out—and such instances, criminal, though true, are not unusual—the information obtained and the data filed are apt to be unreliable.

It must be remembered that the severest critics of systematic want of common sense are those who have to furnish the needed information; these in too many instances feeling that 50 per cent. of the effort so expended is waste energy. The management who, enthroned in high places, issue general orders and binding instructions, occasionally find some systematic routine valuable, and are apt to pursue this interesting pastime to the bitter end. Never having trod a shop floor in the shoes of a foreman, the fact that a special staff and assistance are needed in the matter does not occur to them.

#### Common Sense a Requisite

System, whose value is unquestioned, should be permeated with obvious sense, so that those expected to find intervals in a busy day for the due performance of its ritual will be found in sympathy with, and not antagonistic to its forms. Where a trivial order costs the same amount as a \$2,500 order for this tool of commerce, it is time for revision. Not merely the profit but the amount of the invoice itself may be devoured by the machine of system.

Now, system and organization are not the same thing; so obvious a fact needs mention since misconceptions are abroad on the subject. Actually, one is the direct complement to the other. Organization supplies, or should supply, the human element, correcting, modifying, or supporting the system by which its decrees are carried into effect. While organization is the life blood of industry, system may be likened to the nerves of the industrial body, it should therefore possess contractile and reflex functions; but, minus the life blood of the organizer, system, while a perfect framework, will not keep away or correct defects. The perfect system is yet to be discovered and each isolated firm finds considerable difference in method from other similar concerns.

#### Foreman's Duties Executive

Any routine which makes the foreman's life a burden is clearly against efficiency; consideration of this does not get the attention it deserves. Provided that he is capable, it is quite immaterial whether a foreman can read and write; his functions in the shop are executive and not clerical. Being shop organizer, if he be turned into a second rate clerk, his peculiar virtues are placed in a wrong channel and the shop assuredly suffers in more ways than one.

System, then, should be elastic, and of the least burdensome character which it can be made to assume while serving its designed ends. These requirements should be clearly visualized before it is installed. There should be enough horse sense about it so that its value can be recognized and gain the sympathy of those who have to bear the incidence of its burden. If quantities of clerical labor are involved these should, in the main, be in the custody of a clerk, not of an active organizer such as a shop foreman.

Some concerns seem to fear that their shop executives should have a leisure moment, much less an idle hour. Without some leisure for reflection, unhampered by clerical and other duties, it is impossible for the average rational man to exercise foresight, provide for contingency and keep up the personnel under his control to proper pitch. On a lower plane wastage of time, material and stores may go unchecked for want of personal supervision.

#### System Secondary to Organization

Rational organization should take care of the system, not system rule the organizer. System is, after all, of secondary and not prime importance, however alluring the data it compiles. The main object of the shop is to turn out good work with maximum production. System and the time it occupies is, after all, an overhead charge to be earned and is no end in itself.

As an instance in point of the unchecked ravages of system—A large concern, whose activities occupy many fields and cover a wide range of specialties, appointed a new works manager. Contrary to previous practice, he insisted on getting into direct touch with the commercial side of the business. He asked for monthly returns of sales for the last five years. From these he prepared what he termed curves of tendency. With this information he went carefully through stock and finished parts in hand, making some rather important discoveries. He calculated that in some instances stock in hand for certain specialties was sufficient to last at least 10 years. In others, odds and ends were being continually made singly. Some stuff was season sales, but stock and finished goods went on being made at one and the same time.

After the entire matter had been thoroughly sifted, he sought audience of his managing directors, the net consequence being that the shareholders got no dividend that year. The system appeared perfect, certain definite amounts of stock being held as spares, and against future orders. As operation was automatic, shop orders to replenish stock issued from the office at regular intervals. Market tendencies were ignored by the system in vogue, also the incidence of season on trade. The passage

of years had entrenched the system, while the same interval of time had altered the sales.

#### System Organized

To-day the management get returns of sales month by month, the tendency curves are plotted and passed to the works manager, who adjusts the quantity of stock, using his knowledge of how the shops are fixed and exercising a balanced judgment as to what is necessary.

It is insisted that the system was good, but very misleading. The distinction between system and organization, it is hoped, is made clearer by the instance cited.

While system without due organization may bring the large firm into trouble, in the small shop the lack of both sometimes conjures up a gentleman known to fame as the official receiver.

In the small shop, where one single brain can carry the whole business, there is perhaps little loss in the want of system. It is when the particular brain ceases, or the business grows that an element of order must perforce be introduced. Possibly the efforts of the small shop at this stage of the evolution are of supreme interest. The men grow restless under the supposed slur on their honesty, and think the checking out and in and the exercise of automatic supervision unnecessary and rather childish.

#### One Man Organization

A man who took over the management of a country shop found his life not a bed of roses when, after a decent interval, he decided to re-organize. The troubles were rendered more acute by reason of the necessity for relying upon the memory of the men for details of repeat jobs, as no records were previously kept. Bare material and other things were stored in the open and castings in heaps. The scrap heap of considerable dimensions, was a local mine where material was obtained for odd jobs. The time lost looking for sizeable pieces was never added to the bill and this obviously upset the advantages of the practice.

The junk pile was duly sacrificed to the foundry or sold, quite a proportion placed in proper custody, properly sorted out, and a primitive, but efficient system installed. The bar material went into racks, and bit by bit, with patience and tact, difficulties were straightened out. Grumbles were heard, but the man in question enlisted the sympathy of the employees, who soon found the benefit accruing from the changes, and the shop is now in a flourishing shape, with the relations between worker and management excellent.

System, organization, and a live man, in co-operation, is the real ideal to be sought. All three are necessary, especially the live man.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## GEARED HEAD FOR SCREW MACHINES

**I**NSTANTLY obtainable speed changes and increased pulling power due to the high belt speed employable, are two of the principal reasons for the growing demand for single pulley drive machines. An interesting example of this type of drive is shown in Figs. 1 and 2 which

spindle and replaced by a three gear cluster, which engages with the various diameters of a triple sliding gear mounted on a shaft directly above the spindle. This sliding gear is shown in Fig. 1, the method of operating being by a rod A, and hand lever B, a slot in the rod engaging the largest diameter of sliding gear C. The sliding gear shaft is journaled in bronze boxes carried by the main head casting.

FIG. 1. UNIT GEARED HEAD FOR SCREW MACHINES.

illustrate an all geared head recently designed by the Foster Machine Co., Elkhart, Ind.

This head is designed on the unit principle so that while in itself it is new, it may be fitted to the standard Foster No. 5 screw machine. In order to do this the cone pulley of the standard machine is removed from the

ing with a reverse idler gear which is just visible below the driving pinion on the pulley shaft in Fig. 1.

The driving pulley is 10 in. dia. by  $2\frac{1}{2}$  in. wide and is run at 900 revs. per min. giving a belt speed of 2,350 ft. per min., which under ordinary conditions will deliver 6.2 horse-power to the machine. General requirements however do not call for more than 2 horse-power and in Fig. 2, a General Electric motor of this capacity at 1,800 revs. per min. is shown mounted on the rear side of the leg, the small size of the motor per-

line shaft with ordinary countershaft gear.

Six speed changes are obtained through the geared head, ranging in geometrical progression from 34 to 466 revs. per min. The collet type chuck regularly supplied, has a capacity of 1 13-16 in. and swing over cut off slide  $8\frac{1}{4}$  in. the cut off carriage being equipped with hand longitudinal, and power cross feed with four feed changes.

## MOTOR DRIVEN FOUR PLUNGER HORIZONTAL HYDRAULIC PUMP

THE hydraulic pump illustrated by the accompanying photograph is a recent addition to the extensive line of high pressure hydraulic pumps built by The Hydraulic Press Mfg. Co., Mount Gilead, Ohio. It is of the horizontal, four-plunger type and designed to fill the requirements for a simple, heavy duty hydraulic pump for supplying a large volume of water or other fluid against a high pressure.

It is designed so that it may be equipped with sixteen different sizes of plungers ranging from  $1\frac{3}{8}$  inches to 5 inches in diameter, advancing by quarter inches. The water cylinders are made of forged steel for the highest pressures. For the medium pressures, 1500 to 2900 lbs. per sq. in. inclusive, cast steel is used, and for the lowest pressures the cylinders are semi-steel. The pressures range from 9500 to 700 lbs. per sq. in., and the water capacity from 24 to 326

FIG. 2. REAR VIEW SHOWING BELTED MOTOR DRIVE WITH GUARDS.

FIG. 1402

## MOTOR-DRIVEN HORIZONTAL HIGH PRESSURE HYDRAULIC PUMP.

missible due to the high belt speed employed, being very apparent. Belt guards of very efficient design are fitted, while if desired, the machine can be driven equally as satisfactorily from a

gals. per min. All sizes have bronze valve seats and bronze or nickel steel valves.

The pump illustrated is built for motor drive, requires 150 horse power to

operate, and is equipped with a flexible shaft coupling for motor connection. Any motor having a speed of from 450 revs. per min. to 750 revs. per min. may be used. The speed of the shaft is 60 revs. per min. The stroke of the plungers is 16 inches, the two cranks being set at 90 degs. so that a more uniform flow of fluid may be obtained than with a triplex pump.

At all points where the strain and wear is most severe, the parts such as main bearings, connecting rod ends, cross head guides, valves and valve seats, are of easy access for adjustment and replacement. The frame or pump bed consists of two heavy castings securely bolted together, the cross head guides and main bearing containers being machined in the frame. This insures perfect alignment and gives the most rigid construction. The pump occupies a floor space 18 feet, 8 inches in length by 6 feet, 10 inches in width. While the illustration shows the pump equipped with a spur gear and pinion, it may also be equipped with a herringbone gear and pinion.

#### SPECIAL LATHE WITH THREAD MILLING ATTACHMENT

THE illustration shown herewith represents the latest development by the Gisholt Machine Co., Madison, Wis., of a special machine for performing the operations of boring, facing, and thread milling in the base or in the nose of shells. It can be adapted for cutting either right or left-hand threads, internal or external, U. S. standard or metric. The machine illustrated has a nominal swing of 25 in. with 10 ft. bed, and will handle shells up to 12 in. dia., while a larger machine, 29 in. swing with 16 ft. bed, will handle shells up to 16 in. dia.

This machine has been primarily designed to overcome the difficulty, generally experienced among shell makers, of securing a perfect thread when it is

necessary to re-chuck the work for the threading operation after completing the boring and facing operations. The design, therefore, is such that the boring, facing and threading operations can be finished complete at the one chucking, avoiding any imperfections, and saving the labor of transferring the work and re-chucking in another machine.

Simplicity of design, rigidity of construction, and accuracy of workmanship are features of the machine.

The collet chuck is supported at its outer end by a heavy steady rest, and is driven direct from a spiral pinion on the back gear shaft engaging with a spiral

speed for milling the thread at one revolution of the spindle. Either the slow speed for milling or the regular speed for boring and turning can be instantly obtained by shifting of headstock lever. Change gears are provided, so that the relative speed between the boring speed and the milling speed can be varied to suit conditions. Three rates of quick change feeds are provided at headstock end of machine, and also the usual change gears for obtaining various feeds and for threads required for the screw cutting operation. The power feed for boring operation is through rack and pinion in apron mechanism, and interlocking mechanism is provided to prevent the engagement of the rack feed and the screw cutting feed at the same time.

The tool post is of cast steel and is mounted on the front of the cross slide. It is provided with four holes,  $2\frac{3}{4}$  in. bore, for carrying suitable boring bars holding either single or double-ended cutters. Index pin on cross slide insures accurate lining up of the tool post holes with the headstock spindle when it is desired to

use double-ended boring cutters.

The thread milling attachment is mounted on rear of the cross slide, and is provided with radial adjustment for aligning the spindle of the thread milling attachment with the lathe spindle. The thread milling spindle is mounted in adjustable bronze taper bearings, and has thrust washers and adjusting collar for preventing backlash of the spindle. The spindle is driven by worm and worm wheel and spiral gears from small motor mounted directly on the cross slide. Spindle is fitted with arbor for hob. The front end of cross feed screw is provided with an adjustable cam for accurately feeding in the hob to the correct depth of thread before the main spindle starts to revolve.

#### NEW MODEL LITTLE TUGGER HOIST

FOR the use of those who prefer Manila rope to wire rope for light hoisting and hauling, the Ingersoll-Rand Company, New York, has brought out a new model little tugger hoist, which is designated No. 11.

The square piston, reversible driving engine, automatic lubrication, enclosed gearing, drum release clutch and worm operated band brake, are essentially the same as in the No. 1 model, which was

PNEUMATIC ROPE HOIST WITH MAXIMUM PULL OF 600 LBS.

gear secured to the collet chuck flange, which in turn is secured to the ends of the spindle nose. The spindle is  $6\frac{1}{4}$  in. bore, and has large bearings provided with bronze bushings and the end thrust of the spindle is taken by a ball bearing against the rear housing. The drive from motor to back gear shaft is through a silent chain.

Special back gearing through worm and worm wheel is provided for reducing the speed of the spindle to the proper

SPECIAL LATHE FOR BORING AND FACING, AND MILLING THREADS IN THE NOSE AND BASE OF SHELLS.

described on page 265 of this journal, September 17, 1914. The main differences are in the diameter and length of the drum, the width of the flanges, and, necessarily, the main frame and overall dimensions.

The new No. 11 Little Tugger has a hoisting drum 7 inches in diameter x 17 inches long, with 5-inch flanges. This accommodates 300 feet of  $\frac{7}{8}$ -inch Manila rope. The maximum capacity of this hoist is conservatively rated at 600 pounds. The weight of the hoist itself is 358 pounds. It is 21½ inches long, 31¼ inches wide and 23 inches high.

Like the No. 1 model, this apparatus is built for operation both by compressed air and steam. The standard clamp fits a 4½ in. diameter column or pipe, but by removing the clamp the hoist can be readily bolted directly to any convenient support, timber, flooring, etc. Although designed primarily for underground work, it is suitable for all around hoisting, hauling and handling in mines, tunnels, quarries and industrial plants.

### THREADING MACHINE FOR HOLLOW SET SCREWS

A THREADING machine, equipped with special carriages for threading hollow safety set screws, has been recently placed on the market by the Landis Machine Co., Waynesboro, Pa., which, while primarily designed to thread hollow safety set screws, may be employed in threading stock where there is a con-

tinuous thread and a similar method of holding. The carriages proper are stationary, and support two spindles which have a free horizontal movement. These spindles are brought to the threading

set screws. A collar is placed on the rear of each spindle, making it adjustable for cutting any desired length of thread. For the threading operation the set screw is placed upon the mandrel and

FIG. 1. FLEXIBLE SHAFT OUTFIT FOR LIGHT GRINDING, POLISHING AND DRILLING.

die-heads by means of weights, which are attached by chains to the levers operating the spindles. These weights exercise a continuous force upon the spindles in the direction of the die-heads, making it unnecessary for the operator to advance the stock for the threading operation.

The heads of the spindles are bored and fitted with mandrels for holding the

the spindle automatically forces it into the die head. When the screw is threaded, it remains in a tube, which extends through the spindle from the face of the threading die-head to the rear of the machine. The subsequent threading of screws forces the finished pieces through the tube, where they drop into a receptacle placed at the rear of the machine.

These machines may also be used for threading standard bolts by attaching automatic opening and closing attachments for the die-heads. When standard bolts are threaded, the heads of the spindles on the carriages are fitted with bolt sockets for the various diameters within the range of the machine. These machines are equipped with Landis all-steel die-heads, which employ long-life chasers.

### FLEXIBLE SHAFT EQUIPMENT

THE economies to be effected by the use of flexible shafting on suitable work are now so widely recognized that its position as a standard item of machine shop equipment is thoroughly assured. Recent improvements in their product characterize the Strand Flexible Shaft, which is marketed by R. E. T. Pringle, Toronto.

Two types of this apparatus are illustrated, Fig. 1 showing an outfit for light grinding, polishing or drilling. It is built with either a 1-10 or a ¼ horsepower motor, which drives a 4 in. x  $\frac{3}{8}$  in. and 5 in. x  $\frac{1}{2}$  in. wheel respectively, the former weighing 60 lbs. and the latter 75 lbs. A three-speed countershaft is incorporated in the design, the one-

THREADING MACHINE FOR HOLLOW SAFETY SET SCREWS.

piece leather belt acting as a safety drive to prevent overloading of the motor. By removing the detachable handle and wheel, the drill chuck can be attached in a convenient manner.

A similar equipment, designed for use in tool posts of various machines, is shown in Fig. 2. This outfit is also arranged to give change of speed for different size grinding wheels, and is adapted for internal as well as external grinding. Two sizes of this equipment are offered. The smaller has a  $\frac{1}{4}$  horse-power motor driving a 7-16 in. shaft at 3,500-5,000-6,000 revs. per min., external work being done with a 6 in. x  $\frac{1}{2}$  in. wheel, and internal work with a 1 in. x  $\frac{1}{4}$  in. wheel, the outfit weighing 75 lbs. The larger size has a  $\frac{1}{2}$  horse-power motor driving  $\frac{1}{2}$  in. shaft at 900-1,800-3,600 revs. per min., with wheels 8 in. x  $\frac{3}{4}$  in. and 2 in. x  $\frac{3}{8}$  in. for external and internal work respectively. The sleeve which is held in the tool post is adjustable for different depths, and in the case of the larger outfit it is possible to grind the full depth of an 8 in. cylinder with a diameter as small as 2 in. For lesser diameters the small internal attachment is provided.

All shafts supplied with these outfits are made with an improved metal casing, which eliminates much of the trouble

of Barnard, McKeown & Choquette, and he is at present on the other side, having sailed for England in company with Canada Steamship officials last week.

Geo. D. Davie, the retiring president, has been associated with the company since its inception a number of years ago under the name of the Geo. Davie & Sons Co., and, following the reorganization of three years ago, when the company assumed its present form and name, he became president. It is understood that Mr. Davie continues to own most of the mortgages outstanding.

The company is one of the oldest ship-building concerns on the St. Lawrence, and is the largest in Canada, with the exception of Canadian Vickers, Ltd., Montreal. Its greatest achievement is the boat now under construction for the British Columbia Government, which is nearly 400 feet long.

### RECOVERING TIN FROM SCRAP

INCREASED efforts toward the recovery of various metals are being made as a result of prevailing high prices. Copper, tin and brass are amongst the principal non-ferrous metals now receiving close attention, tin being of especial interest to metal users on this continent because of the fact that the supply has

trollysis is continued till the liquor is again converted to stannous chloride, when it is ready for leaching a fresh batch of scrap. Tin is deposited on the cathodes in very fine crystals, which are scraped off the iron rods at intervals.

The final operation is to reduce the tin crystals to pig, and this is difficult, owing to their fineness and the ease with which they become oxidized. An electric furnace is found the only really satisfactory type, and the one actually used is of the shaft pattern, resembling a miniature blast furnace and standing about 3 ft. high. Once the fluxing slag is melted, the furnace is worked on the resistance principle, wet tin crystals mixed with carbon being fed in at the top of the furnace. The top of the latter is quite cool and, air being excluded from the furnace, there are no oxidation troubles. High quality pig tin is run off from the bottom of the furnace, and up to one ton of crystals can be melted daily.

### GRAND TRUNK RAILWAY SYSTEM ANNIVERSARY

THE Grand Trunk Railway management celebrated last week-end in Montreal the sixtieth anniversary of the inauguration of the inter-city communication between Toronto and Montreal. On November 27, 1856, the first train which joined the cities along the St. Lawrence waterway pulled into Montreal after a journey of 14 hours. The train itself was the last word in railway equipment of that date. The advancement of equipment and operation is shown in the fact that the distance is now covered in seven and one-half hours, or very nearly half of what it took sixty years ago.

In 1852 the Grand Trunk was incorporated to build a railroad between these two cities, and the first section of 125 miles to Brockville was open November, 1855. The following year the section from Brockville to Toronto was operated. In that year the pioneers of the road were proud that they had 849 miles of railroad, while they now have 8,115.

### DETENTION EXTRAORDINARY

AFTER excusing itself for indulging in such frivolity, an exchange tells the story of a salesman who bought the only remaining sleeping car space. An elderly lady next to him in line in front of the ticket window burst into tears.

"I must have a berth in that train!" she exclaimed; "it's a matter of life or death!"

The salesman gallantly sold his reservation to her.

Next morning the salesman's wife was astonished to receive the following telegram from him:

"Will not arrive until to-morrow. Gave birth to an old lady last night."

FIG. 2. MOTOR-DRIVEN TOOL POST EQUIPMENT FOR INTERNAL AND EXTERNAL GRINDING.

usually experienced with flexible shafts. It is so constructed as to be freely flexible to a certain radius, where it automatically forms a stop, thus preventing accidental short bends.

### DAVIE SHIPBUILDING CO. CHANGES

GEO. D. DAVIE, president, and Thomas Robb and D. W. Ogilvie, directors of the Davie Shipbuilding & Repairing Co., Levis, Quebec, resigned from the board of that company at a meeting held in Montreal on October 20, as a result of financial changes that have placed new interests in control of the company. The only remaining member of the board is C. A. Barnard, of the Montreal law firm

to be almost all imported from foreign sources.

The recovery process used in a large American tinplate works consists of three stages. Tin scrap is first "leached" in large vats by a 20 per cent. solution of stannic chloride, containing about 0.5 per cent. hydrochloric acid, the latter being to prevent formation of oxides and oxy-chlorides of tin. Working at 150 deg. F., the leaching process occupies from 3 to 20 minutes, according to the condition of the solution. When the latter is saturated with tin—that is, completely converted to stannous chloride, it is pumped into small electrolyzing vats and electrolyzed at 5 volts, using a current density of 30 amps. per sq. ft., with two graphite plates as anodes and removable iron rods as cathodes. Elec-

### GENERAL BUSINESS, SHIPPING AND SHIPBUILDING

**N**OT the least important feature of the prevailing prosperity in Canada is the marked improvement in the financial condition of many of our manufacturing establishments, large and small, particularly those engaged upon war orders. These concerns have been able to liquidate their liabilities and in many cases are accumulating substantial reserves. What is true in the sphere of general manufacturing is equally so as regards our shipbuilders and shipping corporations. Shipbuilding is booming as never before in our history, at least relative to steel construction, and as regards wood construction the present activity compares very favorably with past achievement. In the realm of shipping even more satisfactory returns are perhaps being realized, due to the dual circumstance that both lake and ocean transportation conspire to that end as compared with the former only in pre-war days. Vessel shortage for ocean service is all the time becoming more acute, and each day, so to speak, finds Canada's pre-war capacity for vessel production, turning down thousands of tons of building orders. Surely the time has arrived for our Government to interest itself to the point of action in fostering the establishment of greater and more widespread enterprise in shipbuilding, realizing as they cannot fail to do from the happenings of the past two years, that whatever other conditions may prevail when peace is declared, shipbuilding on a gigantic scale will claim precedence and be maintained at high pressure for probably a decade thereafter. Is the pressure being applied to Ottawa as powerful as is available and cannot the issue be forced to a successful conclusion? Additional, and the necessary pressure is, we believe, available to force a successful issue.

### ENEMY SAMPLES EXHIBITION

**W**HILE the British Board of Trade and Sir George Foster, Canadian Minister of Trade and Commerce, who was instrumental in having the exhibit of enemy samples brought to Canada, deserve credit for giving our manufacturers an opportunity of inspecting certain lines of German goods that have been sold in numerous markets of the world, the commercial value of

the undertaking as we see it is a doubtful quantity. The exhibit is interesting in that it reveals the technical and practical ability of the German artisans to utilize raw materials to the fullest possible advantage as well as their aptitude for supplying the special kind of articles which certain markets call for. In this respect the exhibit is an object lesson. As far as Canada is concerned, however, it looks as if little thought had been given to conditions which prevail within her borders.

It would, we think, be practically impossible to manufacture ninety-five per cent. of the articles in Canada because the production cost is prohibitive; there is therefore precluded the possibility of competing in markets where these cheap goods have been sold. The cost in Canada of raw materials alone, even in normal times, is such that the class of goods shown could not be produced profitably at a competing price. It has to be remembered that the standard of living in Germany is considerably lower than in Canada, wages being correspondingly on a much lower scale, reducing thereby manufacturing cost. Germany in normal times has direct steamer connections with the markets represented by her wares, which we have not, and cannot have until we have our own merchant marine, or at least until reciprocal trade within the Empire, at least, has developed considerably more than at present.

As an initial effort, put forth with the best intentions and anticipatory of more or less satisfactory results, we may not be too critical. To those concerned, the present exhibit in the matter of the interest displayed—aside altogether from ultimate results, should be an inspiration to further development, and that along the lines of not only a better class enemy goods exhibit as regards value, but relative also to such basic industries as agriculture, mining, mechanical and electrical engineering and allied spheres.

### COST AND VALUE OF TRADE AND TECHNICAL PAPERS

**O**NE effect of munitions manufacture by Canadian metal-working plants that daily comes under our notice is the intelligent interest being taken by operators—yes, and by executives, in the outputs of kindred establishments, and the methods, devices and scheduled routine by which specific results are being achieved. In no direction is the interest more apparent than in that relating to the subscription personnel—numerical and otherwise of this journal. A higher cost of knowledge of one's trade or profession has, like the high cost of living, thrust itself to the front, due of course like the latter to a combination of circumstances, avoidable and perhaps not.

Sources of knowledge are not circumscribed, neither are its demands, in consequence centralization of the former for distribution becomes necessary, and printer's ink and paper are the mediums of accomplishment. Each of these commodities has been caught in the swirl of the universally prevailing abnormally high prices, cost of knowledge distribution having in consequence to follow suit. Whether in pre-war days the low cost at which up-to-date information in a trade and technical journal was assessed at its true value, by subscribers or otherwise, has become of little moment, because of the greater appreciation, due to the enlarged outlook, now being displayed; the relatively determining evidence being that of the alertness with which increased subscription rates have been responded to by those concerned. The cost of developing one's intelligence and aptness to pursue successfully a chosen trade or business career is still well removed from such a classification as "high."

## INDUSTRIAL NOTABILITIES

**J**AMES THOMAS CUMMING, managing director, J. W. Cumming & Son, Ltd., manufacturers of coal drills, machines, tools and mine cars, New Glasgow, N.S., was born at Thorburn, N.S., June 1, 1887, son of John William and Catharine (MacIntosh) Cumming. He was educated at New Glasgow High School. The present business established by the above John William Cumming, May, 1902, grew rapidly until fifty-seven men were employed and many of the coal drills, mining machines, etc., used

JAMES THOMAS CUMMING.

in the coal mines of the Maritime Provinces were being supplied. Upon the death of his father, the subject of our sketch, took over the business. A large market has been secured in Western Canada; the firm having well-established connections at Vancouver and various other points in the West, as also a warehouse and office at Lethbridge, Alta. The business was incorporated in 1911.

Mr. Cumming is a member, New Glasgow Town Council, and a Commissioner, New Glasgow School Board. He married Jean May Burns, daughter of Capt. W. W. Burns, of Norton, N.B., June 17, 1913, and has one daughter. His clubs are: Scotia; New Glasgow, and Royal Cape Breton Yacht (Sydney); and his societies: A.F.&A.M.; L.O.L. His recreations are fishing and shooting. In politics Mr. Cumming is Liberal-Conservative, and in religion Presbyterian. His residence is at New Glasgow, N.S.

Prices Per Lb. Unless Otherwise Stated.

likely that further advances may be expected. Pittsburgh quotations on forging billets have advanced \$5 per ton. Railroad activity is developing, and fair-sized orders are also being placed by coal and lumber interests more especially for light-weight rails. An insistent demand continues for all kinds of plates; shipbuilding and car requirements being the most active. Iron and steel bars have been advanced \$2 per ton, the Pittsburgh quotation being now \$2.85; and \$2.70 respectively.

Activity in sheets is very pronounced at present, increased interest having developed recently in galvanized sheets, which have been advanced \$5 per ton, the base price being now \$5 per hundred. Blue annealed is \$3.30, an advance on the week of \$1 per ton. In addition to the advance noted in wire products last week, an advance of \$5 is reported this week on wire rods, Pittsburgh, the base price being now \$65 per ton. This is largely due to the marked scarcity in this class of material.

Wrought iron pipe and boiler tubes are very active, the base price of cold-rolled steel strip showing an advance of ¼c per pound, and being now 6¾c. The local situation is practically unchanged, although dealers here are contemplating an advance on some lines. Some slight changes are noted in sheets. Queen's Head is now \$7.75; Fleur-de-Lis, \$7.45, and Gorbals Best, \$7.75.

The situation in high-speed steel is not so acute as a few months back, the increased facilities for production having placed the producers in a position where they can supply the entire demands of the consumer. Owing, however, to the high cost of all raw materials, little relief has been shown in regard to price of the commercial article. One of the factors that has much bearing on present conditions is that the total amount of the orders placed at the present time by large consumers is comparatively small relative to those placed about a year ago. This is due to the fact that users do not wish to be overstocked, in event of any sudden cessation of hostilities. Some users are buying regular shipments of steel, sufficient for immediate needs, weekly shipments being subject to cancellation on two weeks' notice. The price of high-speed steel at the present time ranges from \$2.50 to \$3 per pound.

## Metals

The metal situation has not been marked by any important features during the week, although the general conditions are somewhat disturbed by the political situation in the States. Copper is quiet and firm, with further buying imminent. Tin is irregular, but firm. Spelter is quiet after recent ac-

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Que., Oct. 30, 1916.—The strength of the steel market and the continual advance of prices is still the feature of the industrial situation, developments taking place on such a scale that the near future at least is practically in obscurity as far as definite prediction is concerned. The labor situation is still causing anxiety, but is not quite so acute as a few weeks ago.

## Pig Iron

Record activity is taking place in the pig iron market, the situation being again featured by a general advance in

practically every line of basic and foundry iron. The advance ranges from 50 cents per ton on foundry to \$3 on Bessemer and low phosphorus pig.

## Steel

That the existing condition in the steel market will be maintained throughout the entire year of 1917 is now taken for granted. The demand is so enormous that present production facilities are totally inadequate. Price is a secondary consideration to that of getting orders booked for definite delivery. Under these circumstances, it is more than

tivity. Lead is steady, but with an easier tendency. Antimony is quiet, but firm. Aluminum is easier.

**Copper.**—The market continues to retain a very strong position, and, while quiet at present, an undertone of early activity is apparent. Reports are current of probable developments for additional export business, but delivery must necessarily extend well into next year, owing to the pressure already placed upon smelters and refineries. The abnormal consumption is almost entirely due to munitions demand, but it is anticipated that the requirements for domestic purposes, which are expected to be exceptionally heavy, following the close of the war, will be of such a volume that, although a decline will naturally result, the market will retain a high level for some years to come. The London report shows copper in a strong position and slightly higher. New York is very firm, with quotations unchanged. The local market is steady, prices being firm at 31c and 30c per pound.

**Tin.**—The irregular condition of the market has caused a little fluctuation in price quotations during the past week. The apparent accumulation of stocks on the American market has caused the British authorities to become reluctant in regard to shipping permits. This has had the effect of disturbing conditions in these markets. Prompt demand is comparatively quiet, with futures showing more activity. London quotations have advanced on a strong market, while present prices on the New York market are  $\frac{7}{8}$ c higher than last week, the current quotation being  $41\frac{7}{8}$ c per pound. Local dealers report a steady market, with prices firm and unchanged at 45c per pound.

**Spelter.**—With galvanizers taking increased interest in the spelter situation, the market has been more active. The demand, however, has again quietened down, and it is the general opinion that nothing of importance will develop while the American situation is awaiting the result of the Presidential election, not that the present market can be much affected by the event. It seems, however, an ingrained trait that industrial conditions should be unsettled under the circumstances. London is strong and firm, and New York is  $\frac{1}{2}$ c higher than last week, the quotation being now nominally  $103\frac{3}{8}$ c per pound. The local market is steady and fairly active, with prices firm and unchanged, the nominal quotation being 13c per pound.

**Lead.**—The market is quiet, but recent activity has maintained this metal in a steady position. Recent Canadian demands have been fairly heavy, owing to munition requirements. The easing up of the demand has placed producers in

a position to offer fair-sized lots for early delivery. General conditions are, however, unchanged and quotations on all markets are firm. New York quotes 7c and  $7\frac{1}{8}$ c, and local dealers are quoting 9c on a strong market.

**Antimony.**—The market is quiet after the short period of brisk buying. Inquiries are light, but the situation is firm. Quotations are steady, both on the New York and local markets, the former being  $13\frac{1}{4}$ c; dealers here are quoting 15c.

**Aluminum.**—The situation has again resumed the position held a few weeks ago, a decline of 1c during the past week putting the New York quotation at 65c for No. 1 Virgin and 60c for pure remelt. Local dealers are quoting 69c, a decline of 1c over last week.

#### Machine Tools and Supplies

With the demand for shell-making equipment gradually decreasing, the pressure on machine tool builders is becoming much lighter, and conditions are assuming more normal proportions. The

#### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

market, however, is still quite active, as a brisk business is still being maintained in single and small lot requirements. Inquiries for special machinery is still active, but actual demand is not heavy. Owing to the continual advance in steel prices, the quotations on many lines of small tools and shop supplies have been advanced.

#### Scrap

Following the activity of the past few weeks, the scrap market at present is comparatively quiet. A steady demand is prevalent for old copper, and high prices are still maintained. Scrap zinc is fairly active, as is heavy melting steel scrap. Prices are invariably firm, with heavy melting steel showing an advance of  $\frac{1}{2}$ c, the local price being now 10c per pound.

**Toronto, Ont., Oct. 31.**—Trade continues active and the country is remarkably prosperous. The full benefit however is not being obtained owing to somewhat restricted production due to

scarcity of raw materials and shortage of labour. Prices are also very high, but this does not seem to be affecting the volume of business to any marked degree. The demand for goods generally is not being fully met owing to the difficulty that is being experienced in obtaining deliveries from manufacturers. Export trade is steadily growing and is extending in scope as more industries develop their sphere of action. The Dominion Government returns up to the end of last month prove conclusively the remarkable expansion that has taken place in the export during the past twelve months. For the month of September alone, manufactures headed the list, being valued at thirty-eight million dollars as against nine million for the corresponding month of 1915. The statement recently issued covering the period mentioned is extremely gratifying.

#### Steel.

The situation in the trade is getting tighter all the time and the scarcity of steel is steadily getting more acute. With a large proportion of the production of the mills reserved for munitions, a comparatively small tonnage is available for other purposes. The mills have been some time operating at capacity, and, notwithstanding extensive additions to their plants, deliveries are getting more backward than ever. The demand for steel is so insistent and the need so urgent that the steel companies are doing their best to cope with the situation, but cannot, and the situation is thus getting steadily worse. Indications point to a continuance of these conditions for an indefinite period as the mills are now sold up for practically twelve months. Prices are still withdrawn and orders are only taken on the understanding that delivery will be made at mill convenience. Prices on steel bars are entirely nominal and an advance may be looked for any time. Owing to the scarcity of steel some consumers are substituting iron bars for steel in order to secure deliveries. For domestic business, practically the only orders being taken by the mills are with contract customers of long standing and with no delivery dates specified. Small angles, channels and tees have advanced 10c and are now quoted at \$3.85 per 100 pounds. Plates have advanced 25c and are now quoted at \$4.75 for  $\frac{1}{4}$  in. and larger, \$5.00 for tank plates 3-16 in. and smaller. These prices are however for delivery at mill convenience which would not be inside twelve months. For delivery in from two to four months' prices range around 5c at mill. A considerable tonnage of plates is being used by shipbuilders and premiums are being paid for comparatively quick delivery.

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

<b>BRAZIL</b> Bahia, British Consul. Rio de Janeiro, British Consul General.	<b>ITALY</b> Genoa, British Consul General. Milan, British Consul.	<b>RUSSIA</b> Moscow, British Consul General. Petrograd, British Consul. Vladivostok, British Consul. Odessa, British Consul General.
<b>CHILE</b> Valparaiso, British Consul General.	<b>MEXICO</b> Mexico, British Consul General.	<b>SPAIN</b> Barcelona, British Consul General. Madrid, British Consul.
<b>COLOMBIA</b> Bogota, British Consul General.	<b>NETHERLANDS</b> Amsterdam, British Consul.	<b>SWEDEN</b> Stockholm, British Consul.
<b>ECUADOR</b> Quito, British Consul General. Guayaquil, British Consul.	<b>PANAMA</b> Colon, British Consul. Panama, British Vice-Consul.	<b>SWITZERLAND</b> Geneva, British Consul.
<b>EGYPT</b> Alexandria, British Consul General.	<b>PERU</b> Lima, British Vice-Consul.	<b>URUGUAY</b> Monte Video, British Vice-Consul.
<b>FRANCE</b> Havre, British Consul General. Marseilles, British Consul General.	<b>PORTUGAL</b> Lisbon, British Consul.	<b>VENEZUELA</b> Caracas, British Vice-Consul.

## CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

### CANADIAN HIGH COMMISSIONER'S OFFICE

UNITED KINGDOM

W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England.  
Cable address, Dominion, London.

Tubes are very firm, and higher prices are looked for, while an advance in wrought pipe is expected in the near future due to the recent advance in skelp, this material being also very scarce. Higher prices on bolts, rivets and pressed spikes are also anticipated.

Black sheets No. 28 gauge have advanced 25c, and are now quoted at \$4.25 per 100 pounds, while an advance in "blue annealed" is probable. Sheet bars are now quoted at \$50 Pittsburgh, and are getting scarce owing to the heavy demand. It is possible that a famine in steel sheets will exist during the first six months of next year so great is the scarcity of raw material. Higher prices on galvanized sheets are assured on account of the steady advance in black sheets and increase in cost of production.

An advance of nearly 100 per cent. in the price of coke has created a serious situation in the Pittsburgh district. The market continues very firm and prices of all steel products have an upward tendency. The export demand for steel is at a rate far in excess of the unsold capacity of the mills to accept and a lively competition is expected between export and domestic buyers which will result in higher prices. The U.S. Steel Corporation has announced advances in the leading tonnage materials for forward delivery, or to 2.70c for bars, 2.85c for shapes and 3.75c for plates. Higher prices on semi-finished steel have been announced representing an advance of \$5 per ton. Bessemer and open-hearth billets are now quoted at \$50, open-hearth sheet-bars \$50, and forging billets \$73.00 per ton, Pittsburgh. The scarcity of steel in the States is acute and higher prices are inevitable, notwithstanding the present record levels.

#### Pig Iron

Price of pig iron after several months of quietness are now advancing rapidly. This is due largely to the enormous demand for steel, but the sharp advance in coke and possible higher prices on iron ore next January are also affecting the situation. The activity in the U.S. pig iron market is also affecting the trade locally and the market is very strong. Domestic pig irons have advanced \$2.50, Hamilton and Victoria being now quoted at \$29.00 per ton. Practically all brands of U.S. pig iron have advanced, the following prices now being quoted. Grey forge Pittsburgh, \$20.95, and Bessemer, Pittsburgh \$24.95.

#### Scrap

The market is very firm all along the line and advances have to be noted in some grades of scrap copper, affecting crucible, heavy, copper wire, and ma-

chine composition. Heavy melting steel continues in good demand with a shortage of supplies. Steel turnings are in good supply, but there is very little market for this material.

#### Machine Tools

The machine tool market has been more active this week following the placing of further contracts for shells and fuses. For making the latter, a number of orders have been received by a local machinery house for screw machines, high speed bench drills, and bench milling machines. Inquiries have also been received for machine tools for shrapnel plants. Tool room equipment is in good demand but deliveries on this class of tools are slow and restricting business. There is still a steady demand for heavy duty lathes, in many cases for single tools. Prices on machine tools generally are still very high and there is no sign of a decline. Shapers, grinders and milling machines will probably advance. Canadian machine tool build-

#### "CANADIAN MACHINERY" IN ENGLAND

Permit me to compliment you on your publication. Two copies of the September 7 monthly Export issue have come to hand. The articles on the National Steel Car Co. plant, the Montreal Locomotive Shops, and the new C. P. R. Station at Quebec, are specially good, and ought to be of great interest to rolling stock people on this side. Additional copies would not be amiss here.—H. D. J., Bristol, England.

ers are still very busy. New types of tools for shell plants are continually being placed on the market with satisfactory results.

#### Supplies

The situation as regards machine shop supplies continues satisfactory, good business generally being reported. Prices are very firm and advances in many lines may be expected any time although there are no changes of particular importance to note this week. With raw materials, particularly steel, advancing at the present rate, many lines of supplies will naturally be affected such as taps, dies, cutters, files, etc.

#### Metals

The metal markets this week have been unusually steady with quotations generally well maintained. The situation locally continues favorable with a satisfactory volume of business. Copper although unchanged is still strong,

largely due to an enquiry from Russia, France, and Italy for 100,000,000 pounds of metal for delivery during the next six months. Spelter is in fair demand, but tin and lead are dull and unchanged. Antimony is also dull, but aluminum is fairly active. The coming Presidential Election in the States is tending to keep the market quiet there.

**Copper.**—The market continues strong but quiet as domestic consumers appear to be covered for the rest of the year and producers are practically sold up until February. It is reported from New York, that Russia, France, and Italy are enquiring for 100,000,000 pounds of copper, but, as delivery cannot be made before February, the business may not be closed. Domestic buying is good and very little copper available for delivery over the next few months is unsold. Local prices are firm and unchanged, lake and electrolytic being quoted at 31c and casting at 30c per pound.

**Tin.**—The London market is easier but New York is unchanged. The New York market will probably become firmer as some difficulty is now being experienced in getting permits to ship tin from London owing to the heavy stocks in the U.S. The local situation is unchanged and quotations are firm at 46c per pound.

**Spelter.**—Producers appear to be looking for higher prices as they are not over anxious to do business. There is a fair demand for spelter principally from galvanizers, and export business continues heavy. Local price is firm at 14c per pound.

**Lead.**—There is no essential change in the situation, the market being dull and business quiet. The leading interest is still quoting 7c New York. Local quotation 9c per pound.

**Antimony.**—Quotations are nominal and the market quiet. Antimony is quoted at 18c per pound locally.

**Aluminum.**—Demand has shown slight improvement and the market is steady with quotations unchanged at 68c per pound.

#### CANADA'S TRADE SHOWS HUGE INCREASE

THE total of Canadian trade, exclusive of coin and bullion, for the twelve months ending September 30 last, amounted to \$1,738,204,256. This is an increase of \$803,038,833 over the total for the corresponding twelve months of 1915, and of \$737,140,757 in 1914. The total trade for the month of September amounted to \$161,067,661, an increase of several millions over the trade for Sep-

tember, 1915, and of eighty millions over the same month in 1914.

The total imports of merchandise for twelve months ending September 30 last amounted to \$685,278,605, an increase of 268 millions over that for the corresponding period of 1915, and of 154 millions over that for the 1914 period. Total imports for September amounted to \$68,796,262, an increase of 30 millions, or nearly double that of September, 1915, and of 32 millions over September, 1914.

#### Duty Collected

The duty collected during the twelve months amounted to \$129,610,574, an increase of 50 millions over that collected during the 1915 period, and of nearly 40 millions over the amount collected during the 1914 period. During September, \$11,942,791 was collected, an increase of four millions over September, 1915, and of nearly six millions over September, 1914.

The total exports of merchandise amounted to \$1,052,925,651 during the year, an increase of 535 millions over those for the 1915 period, and of nearly 600 millions over 1914. For the month, the exports totaled \$92,271,399, an increase of nearly 40 millions over the total for September, 1915, and of 51 millions over that for 1914. During the twelve months, agricultural and animal products provided just about 50 per cent. of the Dominion's total exports.

#### Manufactures Higher

Manufactures provided about 33 per cent.; mining products came next with 7 per cent.; forestries with 5 per cent., and the fisheries with about 2½ per cent.

Some idea of the effect of the war may be gathered from the fact that while during the 1915 and 1914 periods the products of the farm provided about 40 per cent. of the exports, manufactures in the 1915 period provided only about 25 per cent., and in the 1914 period only about 14 per cent., as against a proportion of 33 per cent. in 1916.

In the total export trade for the twelve months ending in September, agricultural products headed the list with a total of \$396,455,537; animal products totaling \$111,331,332, while those of manufactures were \$361,381,419. Exports of agricultural products trebled as compared with 1915 or 1914, while manufactures did the same as compared with 1915, and were nearly six times those for 1914.

For the month of September, manufactures led the exports with nearly 38 million dollars, as against only 9 millions for September, 1915, and 5 millions for the same month in 1914; agricultural products came next with 25 millions, as against 11 millions for 1915 and 7½ mil-

lions for 1914. Animal products provided 12 million dollars worth of exports, as against 10 for September, 1915, and 7 for September, 1914. Exports of the products of the forest were nearly a million less for September, 1916, than for September, 1915.

#### CANADIAN TRADE WITH FOREIGN COUNTRIES

CANADIANS still buy from the Germans. The war has not wholly severed Canada's trade with the enemy. Whether it be all-necessary dyes, medicines, chemicals, or goods that the Canadians could do without, the Canadian Government returns show that during the year ending March 31 last \$86,304 worth of dutiable and "free" imports for consumption had been brought into Canada from Germany. Of this amount \$41,126 were dutiable and \$45,178 were free; that the figure of \$86,304 represents goods shipped from Germany prior to the declaration of war, but which had not been entered at Customs until some time during the year ending March 31, 1915.

Under the caption, "Trade of Canada with Germany," the official report of the Department of Trade and Commerce gives some interesting figures regarding trade with the Empire's allies and enemies.

During the past decade Canada's trade with Germany steadily increased. Between the years 1912 and 1913 the total business transacted between Canada and Germany increased from \$14,904,919 to \$17,616,941. A year later, the year war was declared, Canadian-German trade, up to March 31, amounted to \$19,019,959. But when war broke out trade did not cease. The official report points out that the results obtained from "Canadian Returns" show that the gross value of Canadian-German trade up to March, 1915, seven months after hostilities commenced, amounted to \$7,248,996. Of this amount, \$3,887,906 worth of dutiable goods were imported as well as \$1,199,080 of "free" goods, making a gross value of German imports of \$5,086,986.

#### Canadian Exports to Germany

During the same period the Canadian exports to Germany were valued at \$2,162,010, divided up as follows: Goods listed as "Canadian produce," \$1,447,391, and \$714,619 worth of foreign produce. While Canada still continued to import supplies from Germany after March 31, 1915, the returns state that Canadian exports to Germany ceased at that time.

The returns given by the Department of Trade and Commerce show that during the twelve months ending March 31

\$394,077 worth of goods was sent to and brought from Belgium. The listed value of Canadian produce sent to Belgium is figured at \$334,762.

#### Franco-Canadian Trade

Franco-Canadian trade during the year ending March 31 last was almost 100 per cent. greater than during the previous year. During the last fiscal year for which the figures are ascertainable, \$42,035,224 worth of business was transacted between the two countries. Of this amount, \$5,949,411 is stated as the value of the imports; the exports were valued at \$36,085,813, a very acceptable balance of trade if the figures did not cover the war business, which cannot be taken into consideration when permanent trade relations of the two countries are taken into consideration.

#### Big Italian Trade

The returns cited in connection with the Italian-Canadian trade show the tremendous impetus given these relations by the war. For the year ending March 31, 1915, \$3,313,709 worth of goods was interchanged by the two countries. During the following twelve months the gross value increased to \$11,653,559. Of this amount only \$920,271 covers the value of goods imported by Canada from Italy, while \$10,733,288 represents the value of Canadian and foreign produce exported by Canada to Italy.

Canada still carries on a vigorous trade with Japan, although in this case there is an adverse balance. During the same fiscal year, as cited above, Canada sold \$998,240 worth of goods to the Japanese, and bought \$4,015,125 worth of goods from the Flowery Kingdom.

#### BRITAIN SHOULD SEEK OUR TRADE

SUGGESTIONS for improving Canada's trade with the other parts of the Empire and outside countries were made by F. C. T. O'Hara, Deputy Minister of Trade and Commerce, to the Dominion's Royal Commission on October 25, at Ottawa. Mr. O'Hara said British manufacturers did not get after the Canadian trade like the American manufacturers. "The goods won't sell themselves," he said, "and it needs some one to sell them."

Merchants in Canada could order their goods overnight from New York and often they had to procure English products in that way.

"With all due deference to energy and ability displayed by the present British Board of Trade Commissioners in Montreal," he continued, "I think Canada should be sub-divided into areas within which additional British commissioners should be appointed, reporting

Finish Bore, Straight Diameter.

Finish Bore, Inside Radius.

## 50% Boring Economy!

High-salaried men are employed to keep the cost of production down, but in this case a boy could see the advantages to be obtained through these boring heads.

25% to 50% reduction is obtained only by the use of Davis Boring Heads. These consist of 16 sizes and 26 different styles, and embrace every operation from a shell of the smallest calibre to 8" and 9.2". (The quality of work produced is limited, and that limit is highest quality.)

Davis Boring Heads are constructed of high-speed steel and are the result of years of scientific knowledge of boring-tool requirements and the experience obtained by the "pioneering" days.

WRITE FOR PARTICULARS.

The heads illustrated here are used for operations on 8" and 9.2" shells. The heads are all equipped with micrometer adjustments. This enables more speed to be put to the operation, leaving the adjusting of the cutters to the micrometer.

## Rapid and Perfect Duplication That is the Mission of the Geometric Threading Machine

From 1/8-in. pipe thread to 1-in. diameter is the usual range of the machine, but where fine pitch threads are to be cut on larger diameters, it can be fitted with a die head that will take care of the work.

The Geometric Threading Machine is not the usual bolt threader, but a machine for producing accurate work in quantity—work that cannot be done economically in any other way, and gives threads as true and clean as can be produced on any screw machine.

Get acquainted with the machine by sending for our Threading Machine Booklet.

## The Geometric Tool Company

New Haven, Conn., U.S.A.

Canadian Agents: Williams & Wilson, Ltd., Montreal: The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N.B.

*If any advertisement interests you, tear it out now and place with letters to be answered.*

to and being directly responsible to the Board of Trade in London."

He suggested that such commissioners be appointed in Vancouver, Winnipeg, Toronto, Montreal and Halifax.

"The United States leaves nothing undone to secure Canadian trade. There are some hundred consuls of the United States here, and thousands, I might say millions, of advertising circulars are sent into this country every year. There are also the innumerable trade and other magazines which carry advertisements of American goods which all swell the trade."

The Deputy Minister of Trade and Commerce also recommended that the various overseas dominions have representatives in Canada.

### Toy Exhibit Fruitful

The recent Canadian Government made-in-Canada toy exhibit at Toronto Exhibition greatly interested the Royal Commissioners. Both Sir George Foster and Mr. O'Hara said that it had done much good to interest manufacturers and give an impetus to trade. Hon. J. H. Sinclair, New Zealand, wanted to know if the showing of German goods did not advertise the latter, but Mr. O'Hara said the opposite was the fact. It gave Canadian makers fresh ideas.

R. H. Campbell, Dominion Director of Forestry, said in answer to questions that the supply of timber had not materially decreased here. When the high price of paper was mentioned, Mr. Campbell was asked if the cost of labor in pulp manufacture had gone up. He said it was not within his knowledge.

### VALUE OF ENEMY SAMPLES EXHIBITION

THE registration for the first week of the Exhibition of Enemy Samples now being held in Toronto were approximately 1200, which included a large percentage of manufacturers. Herbert Kershaw, representing the British Board of Trade, who is in charge of the exhibits, expressed himself to a representative of CANADIAN MACHINERY as being highly gratified with the attendance and also with the interest shown in the various exhibits. Manufacturers from several industrial centres in Ontario and also local manufacturers have visited the exhibition. Many borrowed samples such as blankets, carpets, hardware, soaps, lamps, small tools, etc., to name a few, for closer examination at their factories, in some cases expressing a belief that such articles could be made in Canada.

Manufacturers visiting the exhibition realized the need for overseas markets and have shown deep interest in the

possibility of selling Canadian goods in the markets as indicated on the samples. In this regard, the exhibition has served not only to inspire manufacturers to take up new lines but also to assist them in realizing the various classes of articles which have been sold extensively in remote parts of the world such as Africa, India, Asia, etc. A manufacturer who is sufficiently alert and imaginative also sees in a particular contrivance a peculiar form of mechanism which can be beneficially applied to his own lines of manufacture. It is here where a man with an inventive faculty can effectually combat his less fortunate rival.

The exhibition has doubtless stimulated a desire to learn more about foreign markets, the classes of goods most in demand, how they are sold, credits etc. It has also shown how the Commercial Intelligence Branch of the Department of Trade and Commerce can be utilized to assist in the development of trade with these countries. The Department has means of obtaining much valuable information which is placed at the disposal of any manufacturer requiring same. Another feature of the exhibition is the number of ideas that can be obtained by inspecting the samples and which can be applied in making other goods. The majority of the articles are admittedly cheap but many have embodied in their construction or design some feature which might be copied in the manufacture of similar or entirely different articles, depending of course on what any special idea might consist of.

While it is too early to determine what benefits may have occurred to Canadian industries, there is little doubt that the exhibition will stimulate a desire to develop export trade not necessarily in the class of goods exhibited, but in any product that might be possible to sell in any foreign market. The field is unlimited and the opportunity waiting. It is understood that at some future date an exhibition may be held of articles of German and Austrian manufacture which have been sold in the Canadian market. The exhibition at the Convention Hall will be open until November 6 inclusive.

### HUDSON BAY ROUTE BENEFITS DOUBTED

WHAT benefits are to be derived by the Dominion as the result of the construction of the Hudson Bay Railway was the chief point dwelt upon by the members of the Dominions' Royal Commission at their afternoon sitting on Oct. 25, when it heard W. A. Bowden, chief engineer of construction work of the Department of Railways and Canals.

"The problem is more complex than any other I have had to deal with," the engineer stated, when asked what the benefits to be derived from this big expenditure would be. He outlined the advantages in that the distance from the grain centres to Port Nelson was the same as the distance from Winnipeg to Fort William. The distance from Port Nelson to Liverpool was the same as from Montreal to Liverpool. Accordingly in distance there was a saving by the Hudson Bay route equal to that from the head of the Great Lakes to Montreal. The cost of haulage over this distance is from five cents to twelve cents a bushel.

### Initial Information Unreliable

"The information we had when we started the work has proven very unreliable during the five seasons we have been working. For example, our information was to the effect that the route through Hudson Bay would be open to navigation about the last of June or the first of July. The facts are that it is not open until the last of July or the first of August. The date when it closed was not fixed in that early information. However, ordinary tramp steamers have left Port Nelson on October 23, and have gone through without damage by ice. A Government tug went through on Nov. 1, but the ice would have damaged a tramp. By having observation points at the Straits to direct the boats to open water, it would be possible that the season could be lengthened past Oct. 23."

"Would the grain be harvested in time to be shipped this way?" Mr. Bowden was asked.

"For August the grain shipped would be that which had been left over from the year before. There is always some at the head of the Great Lakes now at that time. The new grain would come on in September, and could be shipped through the months of September and October."

"Before this great expenditure was undertaken," asked one of the Commissioners, "were any steps taken to insure steamship service when the road is completed?"

"No, I do not think there should have been," replied the engineer, "because such a service would have been based on the worst conditions that might arise and, therefore, at the maximum expense."

**Seek Markets in Russia.**—Japanese merchants are making active efforts to obtain a market in Russia for Japanese goods. They are adapting their merchandise to the demand of Russian traders and studying the Russian household and its needs.

# INDUSTRIAL <sup>A</sup><sub>D</sub> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**St. Catharines, Ont.**—The St. Catharines Brass Works will build a foundry here.

**St. Alexis, Que.**—The Saguenay Light & Power Co., are building a power house here.

**Winnipeg, Man.**—The Manitoba Pulp & Paper Co., propose building a power plant at Grand Rapids.

**Toronto, Ont.**—The Taber Laundry Works will build an addition to their boiler room on Bathurst Street.

**Toronto, Ont.**—The Canadian Fairbanks-Morse Co. will build an extension to their plant on Bloor Street West.

**Galt, Ont.**—Plans are being prepared for a brick factory to cost about \$50,000, for the Dodge Metal Hose Co. J. Evans, 30 Water Street, is the architect.

**Sault Ste. Marie, Ont.**—On October 24 the big coal unloading bridge at New Ontario Dock, valued at \$50,000, was blown over in the gale and reduced to scrap.

**St. John, N.B.**—Tenders will shortly be called for the erection of a pumping station for the St. John Railway at St. John, N.B. G. G. Murdock, is the engineer.

**Port Colborne, Ont.**—The International Nickel Co., is getting prices on equipment for the refinery which will be built here. All buying will be done through the head office at 43 Exchange Place, New York.

**Vancouver, B.C.**—The Shell Oil Co. may establish a large refinery near here. A site has been acquired on Lulu Island, adjoining the Fraser River. W. M. Smith, president of the company, has been here looking over the ground.

**St. Catharines, Ont.**—Fire totally destroyed a frame structure, 225 by 50 feet, on section 2, Welland ship canal, erected and owned by Baldry, Yernburgh & Hutchinson, contractors, and used as engine house, machine shop, blacksmith shop, and storehouse. The machine shop was one of the best equipped on the canal. The loss will be in the neighborhood of \$40,000, only partly covered by insurance.

**Sarnia, Ont.**—The Imperial Oil Company has secured a large tract of land at the south end of the city and will start construction of another refinery in the very near future, according to information secured to-day. The new plant will be separate from both No. 1 and No. 2 plants and will cost several hundred thousand dollars in initial outlay, and will be enlarged later. The land was secured sometime ago, and comprises two city blocks and the houses and other buildings will be wrecked to make way for construction.

**Port Arthur, Ont.**—By a vote of 1,200 to 40, the ratepayers of Port Arthur on October 24 ratified an agreement between the city and Annwell G. McIntyre, of Toronto and Montreal, by which the latter, representing interests which now have four pulp mills in Canada, will build another mill here. They plan a plant of 150 tons output per day in three units of fifty tons per day each, to which is to be added a paper mill. Under the agreement upon which pulp limits are secured from the Ontario Government, the 150-ton plant must be completed in three years, at a cost of \$1,000,000. Construction is to be started immediately. The plant will be located at Bare Point, in the north end of the city. The municipality gives 100 acres of land, with no exemption from taxation or other bonus.

## General Industrial

**New Toronto, Ont.**—The Dupont Fabrikoid Co. are building a factory here.

**Niagara Falls, Ont.**—The Nesbitt Billings Co. will build a factory here to cost \$15,000.

**Belleville, Ont.**—The Maple Leaf Tires, Ltd., have commenced the erection of a large factory here.

**Moose Jaw, Sask.**—The Saskatchewan Clay Products Co., propose making extensive additions to their plant.

**Teeswater, Ont.**—The Orangeville Lime and Cement Co. has purchased the William Gordon farm and purpose erecting a plant, valued at \$75,000, during the winter and coming summer. The Toronto Lime Co. is engaged in erecting kilns at present, on the property purchased from Mr. Watson.

## Municipal

**Grand Forks, B.C.**—The Town Council propose extending the municipal power plant.

**Hespeler, Ont.**—The Town Council propose making extensions to the waterworks system.

**St. John, N.B.**—The City Council will shortly call for tenders on the supply of about 3,000 feet of 20-in. cast iron pipe.

**Lethbridge, Alta.**—A by-law was carried to authorize a payment of \$17,000 for extensions to the electric light system.

**Cornwall, Ont.**—The Town Council propose building an extension to the pumping station and installing centrifugal pumps.

**Bridgetown, Ont.**—A by-law was passed by the City Council to raise \$1,319 to pay for the cost of an ornamental lighting system.

**Strathroy, Ont.**—Dr. McCullough, of the Provincial Health Department, has ordered the installation of a chlorination plant for the water system here.

**Fredericton, N.B.**—The City Council has decided to purchase a motor-driven hose truck and a horse-drawn hook and ladder truck. The total cost will be about \$8,000.

**Bracebridge, Ont.**—By-laws will be submitted to the ratepayers on Nov. 20 to guarantee bonds of the Beacon Match Co., to the extent of \$15,000, and granting the company fixed assessment for ten years.

**Winnipeg, Man.**—Controller Astley proposes that a by-law should be prepared for the purpose of raising the sum of \$275,000, to be expended on the erection of a part of a new city hall, to occupy the present location of what is known as the old city market.

## Contracts Awarded

**The Polson Iron Works, Toronto,** have been awarded a contract for boilers by the Lincoln Paper Mills Merritton, Ont.

**The Turnbull Elevator Mfg. Co., Toronto,** have been awarded contracts for elevators by the Canadian Bag Co., Toronto and H. Greisman, Toronto.

# EXPORT TO RUSSIA

Russia wants electrical goods, machinery of all kinds and plants, motor cars, bicycles and accessories, paints, varnishes, medical instruments, shipbuilding materials, railway materials, builders' hardware and material, many textile products, laces, fancy goods, haberdashery, cutlery, jewellery, glass and pottery, steel, aluminum, leather, tools, plumbing goods, pumps, chemicals, agricultural implements, canned goods, furniture, games and toys, household utensils, and hundreds of other products.

We have a way of putting your name and address, and pictures of your product before all Russian buyers—at very small expense—and will care for translations and tell you how to conduct Russian export business.

100 leading Canadian manufacturers have already taken entries in the

## DIRECTORY OF BRITISH MANUFACTURERS FOR RUSSIAN TRADE

a classified reference book of British manufactures, printed in Russian and circulating in Russia (8,000). Purely British and recognized by Governmental authorities.

This announcement is printed so that manufacturers whom we have not already reached may inquire. Book goes to press in December.

*If any advertisement interests you, tear it out now and place with letters to be answered.*

**Montreal, Que.**—The Board of Control has awarded a contract for building a bridge over the canal at Church street to the F. J. Jago Co., for \$78,000.

## Building Notes

**Toronto.**—The Toronto Hydro-Electric system are to erect a new three-storey brick sub-station on the east side of Jefferson avenue, near Liberty street, at a cost of \$20,000. The city architect has approved of the plans and a building permit has been issued accordingly.

**Montreal, Que.**—Operations on the site of Montreal's new million dollar theatre for Marcus Loewe on Mansfield and St. Catherine streets have been started by W. Lajeunesse & Co. Tenders for the erection of the building are being received. The building will have a terra-cotta front.

## New Incorporations

The Weir Machinery Co. of Vancouver has been incorporated with a capital of \$25,000.

The Pacific Steel Co., of Vancouver, B.C., has been incorporated with a capital of \$100,000.

Canadian Metals & Equipment Co., of Vancouver has been incorporated with a capital of \$25,000.

La Compagnie de Pneus Roger, Ltd., has been incorporated at Ottawa to manufacture automobiles, tires, engines, etc., at Montreal. Incorporators: W. J. G. Roger, T. Leduc and C. R. Lasalle, all of Montreal.

Machine Builders, Ltd., has been incorporated at Ottawa, with a capital of \$50,000, to manufacture metal goods of all kinds. Head office, Montreal. Incorporators: J. W. Cook, T. B. Heney and T. B. Gould, all of Montreal.

Commercial Chemical, Ltd., has been incorporated at Ottawa, with a capital of \$50,000, to manufacture chemicals. Head office at Toronto, and the incorporators are: E. A. Seburn, P. Robinson and Marcus Smith, all of Toronto.

Gunn Richards & Co., a New York corporation, has been licensed at Toronto, with a capital of \$40,000, to carry on business as production engineers, factory organizers, with head office at Toronto. John Murray Clark is the attorney.

A. R. Whittall Can Co. has been incorporated at Ottawa, with a capital of \$500,000, to take over the business of

A. R. Whittall & Co., manufacturers of cans and containers of all kinds at Montreal. Incorporators: Albert R. Whittall, Fred R. Whittall, and M. A. Phelan, all of Montreal.

Canadian Molybdenite, Ltd., has been incorporated at Toronto, with a capital of \$100,000, to acquire and develop mineral lands and deposits, with head office at Toronto. Incorporators: F. M. McDowell, G. R. Sproat and C. H. Kemp.

The Reliance Motor & Tool Co. has been incorporated at Toronto to carry on business as manufacturers of machinery and metal goods of all kinds at Toronto. Provisional directors are: W. B. Sturup, J. S. Duggan, and C. A. St. Clair McKay, all of Toronto.

The van der Linde Rubber Co. has been incorporated at Ottawa, with a capital of \$350,000, to manufacture rubber goods and appliances of all kinds, the head office being situated at Toronto. Incorporators are: W. A. McFarlane, V. T. A. Foley, and L. M. Keachie, all of Toronto.

## Marine

**Buy Ships in Vancouver.**—The China Mail Steamship Co., which began trans-Pacific operations a year ago with the liner China, purchased from the Pacific Mail Co., has bought two steamers under construction at the Wallace Shipyard, Vancouver, B.C., paying \$2,500,000 each for the liners, delivery to be made within ten months.

**Will Build Wooden Vessels.**—A. B. Mackay, of Hamilton, Ont., states that he has placed orders for six more schooners for the Mackay lake fleet, at a cost of \$500,000. He declared that wooden sailing vessels of the type but on a larger scale than those used years ago are coming back on the Great Lakes. A four-masted schooner now under-construction at Meteghan, N.S., for Mr. Mackay will be launched on Nov. 15.

**Vancouver, B.C.**—It is reported to be not improbable that in the near future a shipbuilding yard on a somewhat extensive scale will be laid down on the south side of False Creek, Vancouver. Already plans have been drawn, and it is anticipated that a start will be made just as soon as these can be put into shape and a sufficient number of workmen engaged to go ahead. The firm interested in the scheme is that of Messrs. John Coughlan & Sons, the well-known steel manufacturers who have a big steel plant on Beatty Street, Vancouver.

## Tenders

**Weir, Que.**—Tenders for furnishing all labor and materials and constructing a steel bridge and appurtenances to be erected over the Rouge River (Rivington Bridge), addressed to the undersigned, will be received by the Municipal Council of Harrington until Saturday, December 2nd, 1916. All tenders shall be in accordance with the plans and the specifications prepared by the Engineer of the Department of Public Works and Labour, and which may be seen at the Office of the undersigned, Pierre Cantin, Treasurer, P.O. Box 44, Weir, Que.

**Ottawa, Ont.**—By direction of the Honorable the Minister of Militia and Defence, the following old stores will be sold by public auction on November 9, at Toronto, Ont.:—Old brass, copper, gun-metal and ordinary, iron cast, iron wrought, files only, steel scrap, nickel. These articles may be seen on application to the Senior Ordnance Officer (Old Fort), Toronto.

**Ottawa, Ont.**—Tenders, addressed to J. W. Pugsley, secretary of the Department of Railways and Canals, Ottawa, Ont., will be received up to November 15 for the construction of a reinforced concrete elevator with a capacity of 500,000 bushels. Plans, specifications and blank form of contract may be seen at the office of the following:—Chief engineer, Department of Railways and Canals, Ottawa; railways, Moncton, N.B., general superintendent, Winnipeg, Man.; resident engineer, Fort William, Ont.; John S. Metcalfe Co., engineers, Montreal, Que. Contractors who wish to obtain plans and specifications temporarily for their own use may obtain same on depositing a certified bank cheque for \$100.

**Toronto, Ont.**—Tenders will be received by Frank Barber, engineer of the Township of York, up to Nov. 6, for the supply and delivery of the following material:—Tender A-1—for supply and delivery of approximately 20,500 ft. of 24 in. cast iron pipe; A-2—for the supply and delivery of cast iron pipe (12 in. and smaller sizes); B-1—for supply and delivery of 24 in. special castings; B-2 for supply and delivery of special castings, 12 in. and smaller sizes; C-1—for supply and delivery of 24 in. valves; C-2—for supply and delivery of 12 in. and 6 in. valves; C-3—for supply and delivery of air valves; D—for supply and delivery of hydrants; F—for supply and delivery of tops, covers and plugs. Plans and specifications may be obtained at the office of Frank Barber, engineer, Toronto.

## QUANTITY PRODUCER

This tool is used in shops where parts are keyseated by thousands. It is fitted with a high-speed steel rotary cutter for milling internal keyseats in one cut. Shops large and small can use the tool, and it is readily attached to a drilling machine for which it is designed. The tool keyseats in places where Keyseating Machine, Planer and Shaper can't reach. The right tool to use for keyseating interchangeable parts. There is no limit to the variety of work possible to be keyseated.

## Personal

**Robert Hastwell**, superintendent of the International Malleable Iron Works at Guelph, Ont., passed away recently following a short illness.

**Allan Purvis** is appointed general superintendent of the Ontario Division, replacing **J. T. Arundel**, during his absence on account of illness.

**J. H. Boyle** is appointed general superintendent of the Eastern Division, replacing **Allan Purvis**, temporarily transferred to the Ontario Division.

**H. J. Roast**, of the James Robertson Co., of Montreal, was recently elected one of the three vice-presidents of the American Institute of Metals at its annual convention.

**Goodwin Shenton** has resigned his position with **Lyman Tube & Supply Co.**, Toronto, to take over the position of engineer to Messrs. **Taylor & Arnold, Ltd.**, Montreal.

**Hugh Girvan**, 120 Cannon Street, London, E.C., has been appointed sole agent in Great Britain by the **Dominion Sheet Metal Co.**, Hamilton, Ont., for the sale of their galvanized corrugated and flat sheets.

**Harry H. Angus, B.A.Sc.**, who has been in private practice at Toronto, has joined the firm of **MaeMullen, Riley & Durley**, consulting engineers, Montreal and Toronto, Mr. Durley having resigned.

**J. Edward Dailey**, formerly with the **Algoma Steel Co.**, Sault Ste. Marie, Ont., has been appointed general superintendent of the open-hearth steel plant of the **Youngstown Iron & Steel Co.**, Youngstown, Ohio.

**George Arthur Grier**, president of **G. A. Grier & Sons**, Montreal, died on Oct. 25, aged 67. Mr. Grier was also president of the **Dominion Glass Co.**, **St. Lawrence Flour Mills Co.**, and a director of the **Dominion Textile Co.**

**Thos. L. Morrissey**, for 44 years mechanical superintendent for **Robert Mitchell & Co.**, Montreal, died on Oct. 22, aged 72, at his home, 596 St. Antoine Street. He retired a short time ago on account of ill-health.

**Dr. Albert H. Abbott** has been appointed director of the Department of Labor of the Imperial Munitions Board, the appointment to take effect Nov. 1. Dr. Abbott has temporarily retired from the position of secretary of the Provincial Organization of Resources Committee appointed a few months ago by the Ontario Government.

**Edwin F. Goodison**, president of the **John Goodison Thresher Co.**, of Sarnia, Ont., and one of the province's well known manufacturers, died on Sunday, at Hamilton, while en route from Sarnia to Toronto. The late Mr. Goodison was the son of the late Mr. Goodison, founder of the Goodison Company. He was 44 years of age, and a native of Mount Brydges, Middlesex County.

**Hon. Col. Harry Cockshutt**, president and manager of the **Cockshutt Plow Co.**, Brantford, Ont., has completed and sent to France a report on the use of farm machinery in labor saving for use after the war. It is probable that the effect will be to largely increase the export trade of agricultural implements from Canada, Brantford being the chief centre of this industry.

**Major Owen Thomas**, who purchased motor cars for the Militia Department and has been styled a director of mechanical transport, has resigned and is going back to New York to engage in the automobile business. Major Thomas bought most of the equipment for the second and subsequent divisions. **Col. E. E. Clarke** will take over the direction of mechanical transport services.

**Virgil G. Bogue**, a well-known engineer, died recently. Mr. Bogue was born at Norfolk, N.Y., in 1846, and was connected with many important engineering works on this continent. He prepared the plans for the **Rogers Pass tunnel** on the **C. P. R.**, through the **Rockies**, and also made plans for the development of the terminal and waterfront at **Prince Rupert, B.C.**, for the **G. T. P.**

**J. W. Norcross**, vice-president and managing director; **F. S. Isard**, controller, and **C. A. Barnard**, director of **Canada Steamship lines**, sailed from New York recently on the American line boat **St. Paul** for London. The trip is largely for the purpose of cleaning up the loose ends of the English business in connection with the ships that have been chartered for service on the other side during the war.

**C. W. Peterson** of Calgary has been appointed by **R. B. Bennett, M.P.** Director-General of National Service, to the post of secretary of the National Service Commission in place of **G. M. Murray**, who resigned with **Sir Thos. Tait**. Mr. Peterson was born in Denmark, and is about fifty years of age. By profession he is an agriculturist. Latterly he has been engaged in business for himself, and is head of the **Western Printing & Lithographing Co.** of Calgary, and editor of the **Farm and Ranch Review**.

## Trade Gossip

**The Reliance Machine Co., Toronto,** have sold two 6-inch shell boring machines to the Canadian Blower & Forge Co., Kitchener, Ont.

**The Main Belting Co. of Canada, Ltd., Montreal,** have appointed W. W. Hicks, 567 Banning St., Winnipeg as sales agent for that district.

**Russian Firm Changes Name.**—We are advised that the business formerly conducted by L. Knoop at Moscow, Russia, has been taken over by the Trading & Industrial Co., "Volokno" of Moscow.

**Copper Output in U.S.**—Twenty leading copper companies operating in the United States, Canada and South America, produced approximately 895,000,000 pounds of copper in the first half of 1916, an increase of 295,000,000 pounds, or 50 per cent. over the corresponding period of last year.

**Trade Enquiry.**—The following enquiry has been received by the Department of Trade and Commerce Ottawa. 1245. Steel bars, plates, sections, billets, etc.—A Dundee firm will be pleased to enter into correspondence with reliable iron and steel manufacturers in Canada with a view of obtaining quotations for the above.

**Owen Sound, Ont.**—At the meeting of the Utilities Commission held on Oct. 24, it was decided to reduce the light and power rates of the Hydro-Electric system 10 per cent. The decision followed representations which were made to the Hydro Commission in July. This is the first reduction since the Eugenia Power lines were connected with Owen Sound's system.

**Canadian Business Tax.**—Twelve millions of revenue is promised from the operation of the business tax imposed by the budget of the last session of Parliament. The initial assessment is due in November and payments are now being made to the Finance Department by corporations and individuals whose excess profits come within the scope of the Act. Some will pay as high as a million dollars. The money appears to be forthcoming willingly.

**French Farmers Need New Machinery.**—The French Government has officially designated a commission for developing the use of agricultural machinery among the farmers of France. In the memorandum addressed to President Poincare, upon which the official action was based, Jules Meline, the Minister of Agriculture, calculates that for the invaded and devastated districts of France alone

## Saving or Wasting?

The manner in which you handle the drinking water problem in your plant may seem to be a small matter to you—but investigate. The results will be surprising.

The old-time faucet is costly. Running hour after hour, day after day, its ceaseless flow is costing you money, yet without any better service.

## Puro Saves 35%

A Puro Sanitary Drinking Fountain will cut that water bill 35%. We can prove that it has done that for others.

It will give every employee a safe, saner draught of bubbling water free from the contamination of the common drinking cup.

In a word, it is the only sanitary Drinking Fountain that is really safe, sanitary, simple, automatic in control, and easy to attach.

**Dominion Steel Foundry Co., Ltd.**

Hamilton, Ont.

there will be needed 2,000 motor tractors, in addition to the 200 already available; 110,000 plows, 50,000 harrows, 22,000 planters and 15,000 reapers.

**Vancouver, B.C.**—The Dominion Government will promote the building of merchant ships in Canada for Norway. A telegram received from Ottawa reported that H. H. Stevens, M.P., had stated that an Order-in-Council granting necessary permission had been passed. Contracts for three vessels valued at \$3,500,000, were already signed with Vancouver shipbuilding yards, and only required the assurance of the Government that the transfer would be granted on completion to become effective. Orders for seven or eight other vessels will be given almost immediately, and the total value will reach not less than \$20,000,000.

**Women Munition Inspectors.**—The first class in Canada for women munition inspectors was started last Friday at Central Technical Schools, Toronto, when ten students, the total number possible for a class, were given their first instructions. The course will take a week or ten days and the hours will be regular school hours. This class was filled up immediately the announcement was made that it was to be held and about a hundred more have applied to be placed in later classes. As soon as the course is completed these women will be placed in positions now held by men. All applications must go through Miss Wiseman, 504 Traders Bank Building, Toronto and her hours are from 9 to 10 in the morning and from 5 to 6 in the afternoon.

**Car Ferry Across Lake Erie.**—A car ferry route has been established across Lake Erie between the ports of Port Maitland and Ashtabula, on the south shore of Lake Erie, by the T. H. and B. Navigation Co. The initial trip of the car ferry was made Oct. 21st with a full load for Hamilton and other points. The steel car ferry, Maitland No. 1, is the latest in car ferry building, carrying thirty-two loaded freight cars, and is equipped with every device for safe handling of the cars and freight. She will ply between Port Maitland, Ont., and Ashtabula, Ohio, connecting at the latter point with the New York Central and with the Pittsburgh and Lake Erie at Youngstown, thus affording a new and fast route from the Pittsburgh, Connellville and Cleveland districts.

The Polson Iron Works, Toronto, have signed a contract for two steel freighters for Christoffer Hannevig, Christiana, Norway. The ships will be 261 ft. over all, 43 ft. 6 in. beam, and 22 ft. 11½ in. deep. The total deadweight carried will be 3,500 tons. The

two vessels will cost about \$1,200,000, and will be completed July or August, 1917.

**Intercolonial Railway Improvements.** Hon. Frank Cochrane, Minister of Railways, accompanied by F. P. Gutelius, General Manager of Government Railways have returned to Montreal from a tour of inspection of improvements being completed on the Government system of railways at several points in the Maritime Provinces with a view to the handling of the increasing shipments of munitions, transportation of troops, etc., over a quarter million dollars being involved. The Minister expressed satisfaction with the work, and Manager Gutelius said the Government railways had undertaken to handle 80,000 tons of war supplies per month this winter, an increase of twenty-five per cent. over last winter's business.

**Advertising the West.**—Western Canada attractions will be made known in all the chief centres of the United States during the coming winter in a more attractive form and on a more extensive scale than has been hitherto attempted. By means of the moving-picture camera, the life and resources of the West will be shown over a circuit covering 4,000 theatres, and in this way many thousands of people will be reached and interested in the Dominion who might otherwise only hear of the country incidentally. The films have been taken under the auspices of the Grand Trunk Pacific, and will include a variety of pictures in the prairie harvest fields, and through the Canadian Rockies. One of the most interesting pictures is the arrival of a fishing boat at Prince Rupert with 80,000 pounds of halibut on board.

**G. T. R. Celebrates Anniversary.**—On Oct. 27, was celebrated the sixtieth anniversary of the inauguration of railroad communication between the cities of Montreal and Toronto. On October 27th, 1856, the Grand Trunk operated its first through train between these two important Canadian centres. Toronto and Montreal had been dependent for their communication upon the St. Lawrence waterway and the stage routes, and after the close of navigation each year intercourse was maintained with great difficulty. The Grand Trunk Railway Co. was incorporated in 1852 to build a railroad between the cities, the undertaking being looked upon as one of great national importance. The first section from Montreal to Brockville, 125 miles, was completed in November, 1855, and it was on the 27th of October of the following year that the second section from Brockville to Toronto was thrown open, joining up the two principal centres.

## Subscriptions Invited From Friends Abroad

*Canadian Machinery and Manufacturing News* is published weekly. Representing, as it does, the industrial life and activities of Canada, it should prove of very considerable value to those who wish to buy Canadian products, and to those who may wish to sell in Canada.

As a technical journal it compares very favorably, we think, with any other high-class publication, and will be found to be well worth the subscription price, and more.

If you are favorably impressed with this number, we think you will find other issues equally interesting. *Canadian Machinery* contains from eighty to one hundred and twenty pages—fifty-two issues in the year. We invite subscriptions from our friends abroad, and attach a coupon for the sake of convenience.

nery.

**FOR SALE — IMMEDIATE SHIPMENT —**  
New Heavy Duty Shell Boring Lathe for  
manufacture of 6" High Explosive Shells. Write  
for complete specification. Wm. Hamilton Co.,  
Ltd., Peterboro, Ont. (20)

**1-2-SPINDLE SHAPER, WOOD TOP, JOHN**  
Ballantyne, Preston, make, used two months.  
1 Dynamo, 45 lights, Toronto and Hamilton  
Electric Co. make. Used five months. Good  
as new. Box 195, Jordon, Ont. (R.T.F.)

**FOR SALE.—ONE BROWN-BOGGS MARK-**  
ing Machine, suitable for 6" Mark XVI. or  
Mark III. English Shells. Only object in sell-  
ing is that other methods of marking have  
been adopted. Price on application. Taylor-  
Forbes Co., Ltd., Guelph. (14)

**ONE REED TURRET LATHE, 8' BED,**  
swing 28"; 4 2" holes in turret. This ma-  
chine is in first-class condition and was only  
used on 3,000 shells. Is a very powerfully  
built machine and will bear fullest investiga-  
tion. Box 226, Canadian Machinery. (16)

**FOR SALE—BOILER REPAIR AND SHEET**  
iron works. Fine opening, one of the best in  
Canada, for a good man. Only repair shop  
in county. Equipment alone will list at  
nearly \$2,000. Will sell for \$1,200. Write  
for particulars. Box 213, Canadian Machinery.

**GAP LATHE — LONDON TOOL CO. —**  
swings 41" in the gap, 26" over shears.  
20 ft. bed, rod and screw feed, compound rest,  
steady rest, countershaft, 2 face plates, 4-jaw  
chuck, weight about 10,000 lbs. This tool has  
been very little used, and is in excellent con-  
dition. Bargain for quick sale. Winnipeg  
Machinery Exchange, Sutherland & Gladstone  
Sts., Winnipeg, Man. (17)

**WE HAVE FOR SALE THE FOLLOWING**  
equipment: Complete nickel and copper  
plating plant, including direct connected dyna-  
mo and motor; one second operation cast iron  
plug machine, and two first operation cast iron  
plug machines manufactured by the Brown  
Engineering Corporation; 2 16-inch turret  
lathes; 1 38-inch engine lathe, 20-foot bed.  
The above outfit will be sold en bloc or sepa-  
rate. Apply direct to Foundry & Machine Co.,  
Ltd., Montreal. (12)

**FOR SALE—McDOUGALL ENGINE LATHE.**  
20" swing, 10' bed; never been used. Baker  
Keyseater No. 2, good as new. Boring Mill, 2  
bars, will bore up to 30" dia. Boston Forge  
Blower, 27", good condition. Crescent Swing  
Cut-off Saw, almost new. 7½ H.P. Westing-  
house D.C. Motor, in good order. Gurney  
Platform Scale, 2,000 lb., 16" wheels. Man-  
drills, Complings, Hangers, Post Boxes, Pul-  
leys, Belting, Cap Screws, Bolts, etc. Special  
prices on above, write for particulars. Win-  
nipeg Machinery Exchange, Sutherland and  
Gladstone Sts., Winnipeg, Man. (14)

## REPAIRING

**ALL KINDS OF MACHINERY REPAIRED.**  
rebuild and installed. W. H. Sumbling Ma-  
chinery Co., 643 Yonge Street, Toronto, Ont.

## SITUATIONS WANTED

**TOOL MAKER IN CHARGE DESIRES**  
change. Competent to take charge of ma-  
chine shop or tool room. Good references.  
Box 225, Canadian Machinery. (17)

**SUPERINTENDENT—FIRST-CLASS PRAC-**  
tical mechanical man is open for an engage-  
ment as works manager or superintendent.  
Can give best of reference as to character and  
ability to handle help and produce results.  
Box 227, Canadian Machinery.

## SITUATIONS VACANT

**WANTED—NIGHT SUPERINTENDENT TO**  
take charge of factory making 4.5 sockets.  
Apply Box 237, Canadian Machinery.

**FOREMAN TOOL-MAKER WANTED — TO**  
take charge of tool room in plant manu-  
facturing 4.5 sockets and other munition work.  
Apply Box 236, Canadian Machinery.

**WANTED — EXPERIENCED STEEL**  
works draftsman for Nova Scotia. Give  
full particulars, including salary, permanency.  
Apply Box 234, Canadian Machinery. (17)

**FOREMAN FOR LARGE WINNIPEG MA-**  
chine shop — must be aggressive and  
mechanic with good practical experience in  
jobbing, stock and transmission work. When  
applying, state age, experience and salary ex-  
pected. Applications treated confidentially.  
Box 229, Canadian Machinery. (16)

**WANTED — SUPERINTENDENT FOR 18-**  
pdr. shrapnel shell factory equipped  
and now turning out 1,200 shells per day;  
must have good executive ability and able to  
produce results; liberal salary to right man.  
State fully past experience and record, and  
salary expected. Address Box 238, Canadian  
Machinery. (19)

**WANTED — MANAGER MACHINE TOOL**  
department. Must have full knowledge of  
general miscellaneous machinery, especially for  
munition plants. Position affords every op-  
portunity for advancement. Please state ex-  
perience and salary expected. Apply to Box  
239, Canadian Machinery. (18)

## WANTED

**WANTED TO MANUFACTURE A FEW**  
lines of metal products, sheet metal pre-  
ferred. We have complete equipment for high-  
class work. Give complete description and  
rating in first letter. Apply Box 221, Cana-  
dian Machinery. (17)

**WANTED—12" BAR ROLLING MILL TWO**  
or three high with steam drive. One three-  
ton Steam Hammer. One half-ton Steam Ham-  
mer. One pair Rolling Mill Shears. With full  
particulars and lowest price. Apply Box 218,  
Canadian Machinery.

**WANTED — THREE TURRET LATHES**  
suitable for steel sockets, also Thread  
Millers suitable for milling outside thread of  
sockets. Give price and particulars to Steel  
Furnishing Co., New Glasgow, N.S. (19)

The "HENDEY" Lathe

# The Service

## Capacity and Convenience

of a Hendey Lathe will prove of vital importance to your tool room.

The "Hendey" is accurate in the highest degree and suited for the efficient use of watch tool chucks, stop chucks, relieving attachments, etc.

It has the best spindle construction in its taper journals, with annular bearings and automatic oiling rings, which make for accuracy of alignment.

It has **automatic stop** for carriage working in either direction. Has reverse for carriage, controlled from apron.

Wide range of threads and feeds through mounted gearing, with ability to make gear changes for additional threads and feeds without limit.

**A card will get you full particulars. Why not mail it now?**

## Machining the 4.5 in. Mark V. Howitzer Shell

Staff Article

*Shell production in a variety size and type continues to monopolize the activities of Canadian metal-working plants, large and small, and indications are not lacking that for many months to come this state of affairs is likely to prevail. Experience in the field has, as was to be expected, led to developments in projectile design, and this in turn has given increased opportunity and scope for the exercise of greater operative skill and ingenuity.*

**A**LTHOUGH 4.5 in. high explosive shells have been manufactured in this country for over a year, the methods now in use at the various plants are not in all cases the same as originally adopted. During the intervening period experience has taught many lessons, and methods of manufacture have consequently improved. The necessity of increased production has been the chief inspiration for greater effort and inventive genius. New ideas have been evolved, and many of the operations simplified. Since the manufacture of 18-pdr. high explosive shells was abandoned, many plants have been changed over to the production of 4.5 in., while others have been specially equipped for producing this type of shell. The plant which is the subject of this article comes within the latter category.

The 4.5 inch high explosive or howitzer shell is made from a forging 4.8 inches diameter and not less than  $13\frac{3}{4}$  ins. long. The steel billet from which the forging is formed is also 4.8 ins. diameters, but only  $9\frac{1}{2}$  ins. long, and weighing 49 pounds. The forging is, of course, hollow and the sides parallel. The weight of the finished shell is 35 pounds, including the bursting charge (T. N.T.) of 4 pounds. As in all shells, the finished weight must be within fine limits,

the latitude allowed on the 4.5 in. shell being plus or minus 9 drams. This being the case, great care has to be exercised during all operations involving the removal of metal, and this calls for careful inspection in order to catch any error at the completion of each operation. A good method adopted in order to simplify the weight adjustment, and one which is used at this plant, is to leave the base, during the earlier operations, a little in excess of the high limit, so that any extra weight can be removed from the base if the walls of the shell happen to be too heavy. Comparatively little metal has, however, to be removed from the base, and enough to ensure the weight being within the prescribed limits.

### Cutting Off and Centering

The first operation consists of cutting

off the open end of the forging to an appropriate length, this being followed by facing up the base. Both of these operations consist of roughing cuts done on the same type of machine, and do not call for special mention. Three cutting-off machines are installed for the purpose, two being of Martin Pump & Machine Co., Toronto, make, and one by John H. Hall & Son, Brantford, Ont. Centering the base is done at the third operation. This centre is retained in the shell through all the various operations until the base recess is formed. This is done to ensure that the walls of the shell are concentric, a feature in the manufacture that has to be carefully watched. The centering operation is done on a vertical drill fitted with a jig holding the forging steady and locating the countersink drill in the correct position.

The jig has a vertical mandril for holding the forging, while on the top is a hinged plate, which rests on the base of forging, having a hole for guiding the drill.

### Rough Turning Outside Diameter

The fourth operation is rough turning the outside diameter of forging. For this work two lathes by the Dunlap Mfg. Co., Columbus, Ohio, are installed, and also a special single purpose lathe supplied by the Dominion Machinery Co., Toronto. In the former lathes, the forging is held on an expanding

ROUGH TURNING SHELL BODY ON "DOMINION DUPLEX LATHE."

mandril fitted with a draw-back mechanism operated by a hand wheel. The base is held by the centre in the tailstock. One complete roughing cut is made, followed by another cut from the base for rather more than half the length of the shell. The

against the bottom of bore and so controls depth of cut.

#### Rough Facing Base and Hogging Nose

The base is now rough turned to a definite thickness in relation to the bottom of bore. This is done on a facing lathe

the shell, but having the front part tapered on the outside. This part of the sleeve has a series of narrow slots which allow it to grip the shell when pushed forward into the circular cone-shaped casting attached to the lathe head. The push rod which forces the sleeve forward by means of a circular steel plate is operated by a hand-wheel at the end of the headstock.

#### Heating and Nosing-in

What might be termed the first series of operations have now been completed, and the shell is now ready for nosing-in. The shells are heated in a "Mecol" oil-fired furnace, built by the Mechanical Engineering Co., Montreal. Five shells can be heated at one time, about half the shell only being heated. The shells are placed in the holes, nose first, and remain there about one minute, when they are taken out, one at a time, and carried to the nosing press alongside. Draft for the furnace is supplied by a blower.

The hydraulic press was built by the William R. Perrin Co., Toronto, the power being obtained from a belt-driven vertical triplex pump supplied by the same firm. The die for closing in the nose is located in the top of the press, the shell being placed on the table above the ram and forced into the die. At the conclusion of this operation, the shell is placed nose down in powdered asbestos so that it may cool gradually, and not be too hard for the machining operations which follow.

#### Boring and Reaming Nose

After nosing-in, the shell is brought back to the machine shop for the next operation—the tenth—which consists of boring and reaming the nose preparatory

BOTTOMING AND BORING INSIDE DIAMETER OF SHELL.

body of the rough turned shell has now two diameters, the half of the shell next the base having enough metal left for a finishing cut at a later stage, while the other half of the shell is left somewhat larger so as to have a safe margin of stock to allow for any variation on the profile of the nose after nosing-in. The single purpose lathe mentioned above has a central headstock and two tailstocks, one on either side. At each side of the headstock is a clutch and chuck permitting either half of the lathe to operate independently of the other. The chuck is of special design, and has a square slot for driving the expanding mandril. The mandril consists of a series of rollers, which ride up on friction blocks inside the fixture, when it is revolved in one direction. When in operation, the tendency is for the rollers to be forced out, thus holding the shell firm. The lathe is motor-driven.

#### Inside Bore Roughing and Finishing

Inside boring is the next operation, one "Davis" turret lathe and four boring machines, built by the Martin Pump & Machine Co., being installed for this purpose. Each machine has a three-jaw sleeve chuck fitted with a tightening device operated by a push rod in the headstock spindle by means of a hand wheel. The turret holds five tools. The first tool rough bores the straight part of shell, while the second is the first bottoming tool which roughs the inside of base. The third is the finish bottoming tool, while the fourth reams the bore, finishing the inside operations. The fifth tool faces up nose end of shell, the cut being regulated by a bar which comes up

built by the Martin Pump & Machine Co. The shell is held on an expanding mandril, while a carrier also helps to support the shell. The tool holder is a simple mechanism made for the purpose, and is mounted on a cross slide. At the seventh operation, the corner of the nose outside is turned off or hogged to facilitate the nosing-in operation. A machine similar to the above, and made by the same firm, is used. In this case the shell is held in a collet chuck built in the headstock. This type of chuck was designed and made by the Martin Pump & Machine Co., and is fitted to a number of machines which that same firm in-

"MECOL" FURNACE FOR HEATING SHELLS PREVIOUS TO NOSING-IN OPERATION.

stalled at this plant. The chuck is really part of the headstock and consists of a steel sleeve, parallel inside for holding

to threading. A Martin Pump & Machine Co. turret lathe is used for this operation, the machine being equipped with a

collet chuck of the same type as has already been described. The tools are in the turret and the operations are performed in the following order:—Face nose with a cutter at the base of a gauge bar; bore nose with an ordinary

outside profile. For this operation there are installed two engine lathes built by the Hamilton Machine Tool Co., Hamilton, Ohio, each lathe being fitted with a profiling fixture mounted on the carriage. A threaded centre with a square

tionary, while the second travelling along draws the fixture holding the tool part until it comes up against a stop. At this stage both carriages travel in unison, and the tool, therefore, moves in a direction parallel to the horizontal axis, finishing the straight part of the shell after the profile has been completed.

#### Rectifying and Trimming Base

At this stage of manufacture, the shells are carefully inspected and gauged for correct inside profile threads, etc. Sometimes slight errors are detected, which can be easily corrected, the operation being called rectifying. This is done on a Hamilton Machine Tool Co. engine lathe fitted with a turret containing a set of tools of the same type as have already been employed. After being gauged again, the shells move along to the next operation.

Facing or trimming the base to weight has already been referred to. The operation is performed on a Martin facing lathe, the same type of machine as used for facing up the base at the sixth operation.

#### Grooving and Waving

The fifteenth operation is cutting the groove for the copper band, waving and undercutting. Two machines are installed for this purpose, both fitted with a Martin waving attachment as shown in the illustration. The attachment is equipped with the usual three tools, grooving, undercutting, and waving, used in the order named. The waving tool is operated by a cam on the face of the chuck by means of a bar through the attachment. The bar is adjustable to locate the tool in the correct position; there is also a spring to keep the roller up against the cam. The attachment has

SHELL NOSE THREADING AND FUSE SEAT FORMING ON "MARTIN" TURRET LATHE.

boring bar and tool; rough ream, and finish ream.

#### Inside Profile

The eleventh operation consists of forming the inside profile, which is that part of the nose at the back of the thread. The profiling is done on a similar machine to that in the previous operation and made by the same firm. The turret, however, is removed, a bracket mounted on the saddle for holding the tool being substituted. The tool or cutter is of such a shape so as to form the correct profile. It is fixed to a bar and fed through into the nose by hand, and brought in contact with the inside of shell. The shell is next taken to an adjoining machine to have the nose threads cut.

#### Threading Nose and Forming Bevel

The twelfth operation is threading the nose and forming the bevel or fuse seat. This operation is done on a Martin Pump & Machine Co. turret lathe fitted with their standard collet chuck. The turret has four tools—a reamer, a cutter for forming the bevel, and two "Murchey" collapsible taps. The reamer is not always used, as the hole has been reamed at an earlier stage. As a general rule, the bevel is first formed, followed by the first tapping, the second tap being run through afterwards.

#### Finish Turning Outside Diameter

The thirteenth operation is finish turning the outside diameter, including the

box which fits in the chuck is screwed into the shell nose, while the base is carried in the tailstock centre. The profiling fixture which carries the tool post is in the form of a quadrant, and is mounted pivoted to it at the back. The fixture is operated by means of the carriage and a bar attached to the first carriage and apron of the second carriage which is driven by the feed screw along the front of the lathe. The tool

FINISH TURNING OUTSIDE DIAMETER OF SHELL ON "HAMILTON" ENGINE LATHE.

starts cutting at the nose end and travels in a curve to conform with the desired profile. The first carriage is sta-

a gauge to locate the grooving tool in the correct position in relation to the base of shell. The shell is held in the

machine the same way as in the outside finishing operation. Three waves are cut for the 4.5 in. shell.

#### Machining and Threading Base Recess

There now follows a series of operations on the base which form a distinctive feature in the production of the

the bottom of recess faced up, making the nineteenth operation.

• A machine somewhat similar to the one just described is used for this operation, but is of simpler design and has no milling attachment. The shell is held in a hollow spindle, but has no feeding arrangement as in the case of

curely held in a vise. By means of a train of gear wheels the operator can exert considerable twisting force which screws the base plate home and then twists off the square end of plate. This saves one operation, as in some shops the square end is cut off either on a saw or in a milling machine.

The twenty-second operation consists of riveting or peining the base plate. The machine used is a power hammer supplied by the High Speed Hammer Co., Rochester, N.Y. The shell is placed nose down over a vertical spindle on the table, swung under the hammer and turned slowly by the operator while the hammer is operating. The hammer strikes on the outside edge of the base plate, thus securing it firmly in the base recess.

The shell is next taken over to a machine to have the base faced up and finished. The machine used is a Martin facing lathe. Two cuts are taken, roughing and finishing. The series of operations on the base being now completed, the shell is again inspected, after which the necessary markings are stamped on the base and outside diameter. The waves are also nicked with a cold chisel and the nose tapped.

#### Copper Band Pressing On and Turning

The twenty-sixth operation is pressing on the copper band into the groove already prepared for it. The copper band is placed in the groove and the shell inserted in the hydraulic banding press. The press was built by William R. Perrin & Co., as was also the triplex pump supplying the necessary pressure. The shell is placed nose down on a bracket to which a weight is attached

smaller sizes of high explosive shells. These operations consist of roughing out the base recess, undercutting, threading, screwing in the base plate, and facing up the base. The first thing to be done is to form the recess on a Martin turret lathe. The shell is held in a collet chuck and is supported at the base end by a carrier. In the turret are two end mills for roughing and finishing the recess respectively.

the milling machine. In place of the milling attachment is an ordinary facing tool in a tool post on the cross slide. The next operation is to drill the grub screw hole in a vertical drill press, the hole afterwards being hand-tapped on a bench adjoining the drill. The shell is now inspected, particular attention being paid to the base recess before the base plate is screwed in.

Before being screwed into the base recess, the base plates are painted with

The next and seventeenth operation is to undercut the base recess preparatory to threading. This is done on a milling machine designed for this particular purpose and built by the Martin Pump & Machine Co. This machine is very similar to the one in which the threading operation is done, the chief difference being in the form of cutter used. The shell is carried in a sleeve on the head, and revolves once, slowly, while the undercutting is being done. The cutter has an independent drive and forms two undercuts, one at the bottom of the recess and one at the edge. The undercutting is done to facilitate the threading operation.

At the next operation, the threads in the base recess are milled in a Holden-Morgan Co. milling machine. The shell is held in the hollow spindle which makes one slow revolution, being operated by worm and wheel driven from the countershaft above. The milling cutter is held in a bracket and has an independent drive. When this operation has been completed the shell is taken out to another machine to have

GROOVING, WAVING AND UNDERCUTTING EQUIPMENT FOR COPPER BAND GROOVE; "MARTIN" MECHANISM.

a special composition or cement. The machine used for this operation is mounted on a table, the shell being secured to assist the operator in placing the base of shell in the die which is in the top of the press. The pressure is applied

three or four times, the shell being turned to ensure equal distribution of pressure on the band.

The copper band is now finish-turned on a machine built by the Martin Pump & Machine Co. The shell is held at the base by a chuck fitted with a drawback tightening arrangement, while the nose is carried in a cup-holder on the tail-stock, the cup-holder being supported by a carrier. On the cross slide are mounted a roughing tool located under the work, a forming tool at the front, and a finishing tool on a fixture at the back. The forming tool travels at right angles to and rough turns the copper band. The forming tool then does its work followed by the finishing tool at the back. The finishing tool is fed by a hand lever, and travels down and past the copper band, just shaving it.

#### Base Plates

A subsidiary operation consisting of machining the base plates is done on a Martin milling machine designed for the purpose. The turning tools are carried in tool posts on the front of cross slide, while the milling cutter is carried in a fixture on the back of cross slide and has an independent drive. The first operation is to rough and finish the face of base plate. Both tools are in the same tool post, the roughing tool preceding the finishing tool, being set ahead of its. The outside diameter of base plate is turned in two cuts. The milling fixture is now brought into operation for forming the threads on the outside diameter of base plate. An arm attached to the fixture carries a chaser nut which is swung over and engages with the threads on the end of main spindle, this arrangement allowing for the required number of threads being cut on the base plate. The speed of the main spindle is reduced so as to make one revolution while the threads are being cut. The milling cutter is operated by an independent belt.

#### Varnishing and Painting

After the copper band has been turned the shell is washed to remove all grease, etc., then inspected and taken over to be varnished. For the varnishing process a heavy-body air-drying varnish is used, supplied by The Sherwin-Williams Co. No baking is necessary, but the shells are sometimes warmed before being treated to assist the drying, an electrically heated oven being used. After the varnish has been applied, the shells are placed in wooden racks, nose down, to drain and dry, the time varying according to climatic conditions.

The shells now undergo the final inspection and are then painted. A sam-

ple of varnish is also taken and tested. The painting is done on a table fitted up with an arrangement for holding the shell and rotating it. A vertical spindle, with a cup on the end, comes up through the table, the spindle being driven from the line shaft. The shell is placed nose down on the cup and while it revolves the paint is applied by means of a brush. Only one coat of paint is required and the color is yellow ochre. When dry, the plug is screwed into the nose and the shells packed, two in a box, for shipping.

"HOLDEN-MORGAN" SHELL BASE RECESS THREAD MILLING EQUIPMENT.

#### MUNITION WORKERS' WOES — GLASGOW GIRL'S EXPERIENCE

"MANY women are going in for munitions," I read—a fact that somehow reminded me of Queen Anne's decease—"especially shell-making, where they make big money, \$100 a week."

That last clause was news to me, and probably to many others. After some abstruse calculations worked out with a wet towel round my head, strong coffee, and a big bill to the Electric Light Company, I found that \$100 a week figured out at about five thousand a year. That was the job for me, I decided, and began to see visions and dream dreams of rolling up to my daily toil in a Studebaker or a Rolls-Royce.

"I forthwith made my application, and was told I must sign on for six months.

"Is that all!" I exclaimed, greatly disappointed; "I thought it was for the duration of the war and six months after."

#### Dreams of a Motor Car

Six months of munitions, even at \$100

a week, would scarcely run to a Rolls-Royce, upholstered in grey suede, plated fittings, and a silver flower-holder. The flower scheme would be mauve or purple, to look well against the grey suede.

Then I was informed that at the expiration of that term—if the war held good—I could sign on for another six months, and so on, ad libitum infinitum. With that I was forced to be content.

The next step was my credentials. I had to get an obliging friend to rake up the records of the past to prove that I was a bona fide born British subject,

without a taint of Germanism in my make-up. I next received a card for a huge emporium, where they turn out uniforms of all descriptions, from a humble boiler-suit to the full dress rig of an admiral or general. After having my measurements taken I was hustled into a khaki overall that fitted where it touched.

"This is much too large," I said; "it will require a great deal of alteration."

"Oh, no; that fits you beautifully," was the bland answer. "You see, you have to allow for shrinkage in washing."

From that onwards I found myself caught in the meshes of the mystery of the age—the insurance problem; and my struggles at disentanglement were as futile as a lamb among the folds of a boa constrictor.

#### Learning the Trade

My first day in a machine-shop was memorable for one of the most excruciating headaches ever experienced. The roar and rattle of machinery was deafening; and I marvelled at the ease with which the girls talked and understood each other, without even raising their voices. Several spoke to me. I knew they spoke, for I saw their lips moving; but not being versed in lip language I had to make negative gestures in dumb show.

The general mode of teaching in large munition factories is to place the novice beside an experienced worker, where, by using her eyes and the verbal mark of interrogation to some purpose, she is supposed to lose her novitiate in a week. Think of it, ye would-be munitionists! We are to acquire in a week a working knowledge of engineering—superficial though it may be—that takes a man five years' apprenticeship to master. As I looked at the seeming hopeless conglomeration of levers, cranks and spindles, I thought a lifetime seemed all too short to master the intricacies of a machine, but as the days passed a sort of cosmos gradually evolved out of the chaos. Each

crank and lever had its allotted work to do, and when one began to understand the reasons for the various parts of this steel medley the intricacies vanished and one's interest was aroused.

### Tragedy and Comedy

At the end of a week I was put on to a machine of my own, and then my troubles began. I soon proved the well-worn fact that it is one thing watching another work a machine, but quite a different matter when you come to do the job yourself. I was at the process called "fine-boring." The first—and what seemed the simplest part of that process—is hammering the shell into the chuck. As an offstart, I didn't hammer it in tight enough, consequently jammed my shell and had to get the mechanic to bang it out. My next attempt was not much better, for I hammered a finger as well as the shell, and was assisted to the ambulance room.

Another little matter that seemed simplicity personified under the hand of the experienced worker, was the manipulation of the water tap. On these machines an adjustable pipe is fixed, for a flow of water must constantly play on the shell, otherwise the cutters would get red hot. For the first few days I drenched myself and everyone else within hailing distance. That stream of water squirted in every direction but on the shell, and became more obstreperous the more I wanted it to behave.

A great naval personage, resplendent in brass buttons, epaulets, and a monocle, was being shown over the works by the manager. As ill-luck would have it, he stopped beside my machine. I got nervous; the stream of water got cranky; and the great naval personage got it full in the eye! Some others of my woes are, however, too tragic, and we will mercifully veil the grim tale of ruined shells, smashed cutters, and wrecked machines.

No doubt the mechanics could tell some amusing yarns of the woman munition worker. After some weeks experience, I was one day congratulating myself on being at last perfectly proficient. The machine was working beautifully, and the shells were turning out A1. Unfortunately it was too good to last. Something seemed to go wrong. I was "bottoming" a shell, and pressed and hauled the handwheel till the perspiration came trickling off me, and splashed on the machine; yet I didn't make the least impression.

In a frantic flurry, I ran for a mechanic. When he came up, a slow grin overspread his face as he drawled sarcastically, "Do you not think it would be a good plan if you started your machine?"

I had forgotten to pull the starting lever, and my machine was not working.

### \$1.75 to \$12.25

"My first pay was \$1.75. A dollar and seventy-five cents for the hardest week I ever wrought! As I stumbled home, a weary, wan, and wild-eyed wreck, I thought of my beautiful dream-car, and laughed a bitter cynical laugh; but then, I reflected, I am only at the learning stage, and practice is all that is required for proficiency. Gradually I improved, and soon learned the art of picking my shells. If by chance I lifted a bad one I quietly put it back, and let someone else risk a broken cutter; for a bad or hard shell is ruinous to the cutter, and requires an experienced hand to bore and polish successfully.

I have now almost completed my six months' hard labor. The most I have ever earned is \$12.25 for a week's work. With another six months' practice I might manage \$13.35, or, by a stroke of good luck, \$14.60, but I know it is outside the bounds of possibility to squeeze out a cent more. Therefore, I have only one thing to live for, and that is revenge.

First, however, I must find that descendant of Ananias who gave forth to the world the imagined creations of a fevered brain, under the guise of truth, and when I find him—

I have not yet decided on the particular mode of torture I will use to make him eat his words.

### BOARD OF TRADE IRON AND STEEL INDUSTRIES COMMITTEE

THE British Board of Trade has appointed a committee to consider the position after the war of the iron and steel industries. The committee is composed of the following gentlemen: Mr. G. Scoby Smith (chairman), Sir Hugh Bell, Bart.; Mr. Archibald Colville, Mr. John Hodge, M.P.; Mr. James Gavin, Mr. George Mure Ritchie, Mr. Henry Summers, Mr. Benjamin Talbot, Mr. John King, and Mr. John E. Davison.

In order to carry out its investigations the committee desires to elicit exact and detailed information from a number of representative and individual firms, and from industrial, commercial, and labor organizations, with respect to:—

- (1) The extent and area of trade, and capital normally employed.
- (2) The dependency upon resources external to this country for supplies of material and plant.
- (3) Labor relations, labor restrictions (if any), and comparative conditions in the industry.
- (4) British methods of conducting foreign business contrasted with foreign methods of conducting export business.

(5) The effects of manufacturing and commercial co-operation upon trade at home and abroad.

(6) The extent to which British industry is adversely affected whether as regards (a) the retention of business hitherto or previously secured, or (b) its capacity for expansion, by the existence of foreign tariffs, preferential arrangements, bounties, subsidies, or special facilities granted by foreign governments, railways, or trade combinations, to their manufacturers or exporters; and what is the remedy.

(7) Terms of payment and of credit.

(8) Technical education, skill, and nature of employees.

(9) The effect, if any, of wayleaves, and mining or other royalties upon the industry, either as regards home or export trade.

(10) The effect, if any, of railway and shipping rates upon the industry, as regards home or export trade.

(11) General information.

The recommendations of the committee must depend for their effectiveness upon the co-operation of all who are interested in the British iron and steel industries. The committee, therefore, invites the active support and assistance not only of individuals, but also of industrial organizations of whatever character. The committee suggests that the various trade organizations should submit either through their secretaries or through small committees, a general statement of their views together with suggestions which in their opinions might suitably be supported by the presence of a deputation representative of the organization as a whole. The committee will be glad to receive statements supported by verbal evidence from representative firms and from individuals, whose depositions, in the opinion of the committee, will be valuable to their work. It will also welcome the assistance of import and export merchants who are interested in the handling of the products of the iron and steel industries at home and abroad.

TRADING AFTER THE WAR has been discussed by the Johannesburg Chamber of Commerce, and the result is a comprehensive series of suggestions in support of Imperial tariff preferences, the establishment of Government assistance of key industries, differential charges against all enemy shipping at South African ports, the refusal of trading licenses to enemy subjects or to agents of enemy firms, the exclusion of enemy trading journals, advertisements, and price lists, and reciprocal tariff relations with other countries, without, however, placing them on an equality in the British Empire.

A Department for the Interchange and Distribution of Shop and Office Data  
and Ideas Evolved from Actual Practical Application and Experience

## MACHINING A BLIND HOLE HAVING THREAD LIMITATIONS

By F. Scriber.

IT sometimes happens that work which is in itself comparatively easy to machine may be lifted out of the ordinary class by having some special condition attached to its manufacture. Such a

FIG. 1. SKETCH OF PIECE SHOWING BOSSES FROM WHICH THREAD MUST BE POSITIONED.

condition is evident in the part illustrated by Fig. 1 where the operations to be performed are plain turning, boring, tapping, milling and drilling operations, but as the hole through the work is closed at one end and the thread must

FIG. 2. TURNING AND FACING CLOSED END OF PIECE.

start in correct relation to the drilled bosses the fixtures used for machining this piece are quite interesting.

### Bosses Control Threading

Referring to Fig. 1, which shows the work which is to be machined, it will be

FIG. 2. HOLDING THE WORK BY FINISHED DIAMETER WHILE MILLING BOSSES.

noticed that there are two bosses A. In assembling these pieces with their units the position of the thread B in relation to these bosses is an important con-

FIG. 4. METHOD OF HOLDING WORK WHILE MACHINING AND THREADING OPEN END. AT THE RIGHT ARE SHOWN THE VARIOUS TOOLS USED.

sideration, and this must be borne in mind throughout the complete tooling arrangement. The work on this piece is carried out in four operations, namely, turning and facing the closed end C, milling the bosses, boring, tapping and facing the open end, and drilling the holes in the two bosses.

The first operation—turning and facing the closed end—is completed as shown by Fig. 2. At this operation the work is gripped on the rough diameter

in a three-jawed chuck, and the diameter X is turned with tool A, which is held by suitable holder B to the turret of the machine, while the end is faced by the tool C held in a cross-slide. This is completed by taking the usual roughing and finishing chips, using the tools held on front of cross-slide and on one turret face for roughing, while the tools held on the rear of cross-slide and second turret face are used for finishing.

The next operation, which must precede the boring, etc., is milling the bosses, and in this

respect care must be exercised to have the bosses directly opposite each other when milling them. Referring to Fig. 3, the work is held by

the finished diameter X in a soft jaw chuck and a test rod is used to determine when both bosses are an equal distance from the table, as indicated by the dimension line Y. When the bosses are located in a horizontal position by this method the pad A held in the tailstock of the milling machine is brought up to support the end of the work, and one boss is faced off by the use of a milling cutter B.

Following this, the work is indexed half a revolution and the other boss is milled. The tools for this operation, as is obvious, were all standard, such as the index head and tailstock centre for the milling machine, and likewise tools for

FIG. 5. DRILL JIG FOR BOSSES.

the first operation were standard, as furnished with the machine.

### Fixtures and Tools for Threading

The tools for the third operation, Fig. 4, are the most interesting, as at this time the thread is cut. Referring to the above illustration, the work is held by a special spindle nose fixture locating at A from the end and finished diameter, and at B and C from the bosses for radial location. The work is securely held in position by clamps D, one at each

side these being tightened by screws E.

To machine this end, four turret faces and the front and rear blocks on the cross-slide are used to hold the tools, the cuts to be made being rough bore hole, using bar F and two flat cutters, rough face end with tool G in front cross-slide, finish bore holes, including hole to be threaded, using bar H and three single point cutters finish face end with tool J on rear cross-slide block. In the hole of the third turret face a short bar K, containing one cutter, is held for size boring the end of hole, while in the hole of the fourth turret face the tap, which is of the collapsible type, is held. This tap is located in the turret hole so as to start the thread in correct relation to the bosses.

For drilling the bosses, reference is made to Fig. 5, which shows a simple jig that locates the work from the bosses by means of a screw bushing A, while the closed end of the work is held in the ring B. This jig is constructed so it may be turned over, so the bosses may be drilled without disturbing the work, thus making certain that the holes are drilled opposite.

#### HANDLING RIG FOR SHELL CUTTING OFF MACHINE.

by John L. Watts

THE operation of cutting off the open end of the 4.5 in. shell in a cutting off machine has been expedited by the use of the rig shown herewith.

The placing of the forging in the chuck of the cutting off machine and the removing of the forging after cutting off is very tiresome on account of the weight of the forging. Also one's fingers are apt to be jammed if care is not exercised. This rig was designed to overcome this difficulty and does it successfully.

The equipment is intended to be bolt-

Now assuming we have a shell in the machine and the cut started, we place another shell on the arm B and strike the center punch C, which is so placed as to mark the shell at the point at which it is desired to cut it off, care being taken to ensure that the shell is against the end of the arm. When the machine has cut off the shell in the clutch, this finished shell can be easily slid onto the empty arm, the whole thing is then revolved a half turn which brings the other shell on arm B into a position from which it can be slid along the arm into the chuck. While this 2nd shell is being cut off the 1st shell is removed and replaced with a 3rd one which can be marked ready to put in when the 2nd shell is cut off.

#### MAKING THE SHOP-LADDER SAFE

by A. D. I.

AMONG the many kinds of industrial accidents that occur in factories, none are perhaps so common and have such serious and fatal consequences, as those due to slipping shop-ladders. While a great deal of study has been given to render these safe, most of this attention has been given in providing means in having the feet of the ladder properly equipped with rubber or steel-pointed shoes.

##### Watch the Top

It never occurs to anyone that the top of the ladder, where so many exertions take place by workmen in doing overhead work, requires suitable equipment of some kind to prevent ladder from swaying from side to side. For as everyone knows who has had occasion to use one, a ladder, whenever placed against a stringer will seldom remain in position while one is standing on it, and workmen, are obliged to take hold of a stringer with one hand in order to hold the lad-

shop-ladder, which will prevent them from swaying sideways, and also from slipping outward at the feet as usually happens. Referring to the sketch, two short strips of 1½ in. angle-iron, having several teeth notched in on one side, are screwed in at the back of the ladder at the top as shown. When the ladder is placed against a stringer, the teeth become imbedded in the wood, causing

SAFETY DEVICE FOR TOP END OF SHOP LADDERS.

der the ladder to hold firm when so placed. There is little possibility for the ladder moving, and workmen can freely use both hands when working overhead.

Shop ladders are nearly always standing upright against walls and beams, owing to the less room they take up. As is well known these are often jarred against belts and pulleys and have to be constantly watched. In the adoption of this attachment this will hereafter be unnecessary, and also ladder accidents will be greatly checked, and less frequent than they are now.

#### A SLEEVE HOLDER KINK

by J. Wright

DRAFTSMEN and others who are in the habit of wearing sleeves in their work, have always experienced trouble in keeping these held up on the arms, for as soon as the elastic contained inside the band around the top of the sleeve becomes stretched a little, the sleeve becomes loose and is constantly slipping down.

In the enclosed sketch, is shown a useful kink, wherein this trouble is overcome. A pair of adjustable sleeve-holders or armlet-elastics are placed in-

DEVICE FOR MARKING AND HANDLING SHELLS IN CUTTING-OFF MACHINE.

ed on the bed of the cutting off machine with end of the carrying arm as close to the chuck as it can conveniently be placed and be able to swing around with a shell forging on it.

der steady, by which they are greatly handicapped in handling tools, etc.

In the accompanying illustration, is shown an easily made simple attachment, that can be fastened to the top of any

side the sleeve band, having the buckles protruding out as shown. When the sleeve becomes loose, it is only necessary

USEFUL IDEA FOR HOLDING SLEEVES.

to take up on the elastic by pulling the ends through the buckles.

#### A SCALE-CLIP

by E. V. A.

WHEN it is necessary to have in constant use a scale for measuring turned work on a lathe, it is the practice of lathe hands and machinists to lay the scale on the machine carriage in order to have it handy when needed. Very often the scale falls in the tee-slot or drops off into the drip-pan under the machine, and considerable time is wasted in searching for it.

In the accompanying sketch is shown a handy scale-clip that can be fastened

SCALE-CLIP FOR LATHE HANDS.

in the opening in the tee-slot in the lathe-carriage. It is made from a piece of flat sheet steel, bent and tempered in the shape as shown. As seen, the scale is slipped under the clip, each time it is laid down, and always remains in position where it can be picked up quickly.

#### ESTIMATING METAL TEMPERATURES BY COLORS

THOUGH the use of pyrometers in foundry work has greatly increased of late years, there are certain conditions under which they cannot be applied and it is then necessary for the foundryman to be guided by the eye. The following tables, given in the Foundry Trade Jour-

nal will be found useful as a general guide to the relation between temperature and appearance.

	Deg. C.	Deg. F.
First visible red .....	525	977
Dull red heat .....	700	1,292
Turning to cherry .....	800	1,472
Actual cherry red .....	900	1,652
Bright cherry red .....	1,000	1,832
Dull orange .....	1,100	2,021
Bright orange .....	1,200	2,192
Bright orange .....	1,200	2,192
White heat .....	1,300	2,372
Bright white heat .....	1,400	2,552
Dazzling white heat ....	1,500	2,732

#### Tempering and Hardening Tools

	Deg. C.
Light straw .....	220 to 230
Dark straw .....	240
Yellowish brown .....	255
Reddish brown .....	265
Purple .....	275
Violet .....	285
Cornflower blue .....	295
Pale blue .....	310 to 315
Sea-green or grey .....	330

#### TOOL TREATMENT IN RAILWAY SHOPS

EXPERIENCE in the locomotive workshops of the Illinois Central Railway has shown that the best results with taps, dies and other tools made from 1.10 per cent. carbon steel are obtained by heating them between 1,350 and 1,600 deg., according to their size. The 0.9 per cent. carbon steel which is used for mandrels, beading tools, etc., is heated between 1,400 and 1,625 deg., and the foreman blacksmith, who has charge of the work states that in hardening the tools he finds it more satisfactory to dip them on a declining temperature; that is to say they are heated slightly above the required temperature and then allowed to cool down again before dipping.

In dipping spiral reamers, they are rotated slowly in a direction opposite to that of the spiral, and this, it is claimed, prevents warping. The long taps and reamers are packed in charcoal in an iron tube brought up to a red heat in an oil furnace and soaked at the proper temperature in the electric furnace. It takes from 1 to 1½ hours to bring the furnaces up to working temperature, which might be considered a disadvantage were it not for the fact that the gradually rising heat can be utilizing in drawing the temper on some of the tools hardened the previous day.

The temperatures at which the furnace is used ranged between 1,350 and 1,625 deg. Fah., according to the size of the tool being treated and the grade of the steel. In handling this grade of steel it is necessary not to permit soaking heats; that is, as soon as the steel has been

brought up to the required temperature it should be removed from the furnace. A certain amount of air is allowed to enter the furnace while treating the steel, as it has been found that a reducing atmosphere will produce soft spots on the tool.

#### ANTI-SLIP LADDER FOR TILE OR WOOD FLOOR

By J. E. Noble.

MAKE two hooks, as shown at A and B, Fig. 1, and fasten them to the ladder ends tightly with screw nails. When

FIG. 1. ANTI-SLIP LADDER.

using the ladder on a rough wooden floor pull down the hooks and tap the point into the wood with the heel of your boot, and the ladder will be then absolutely safe.

For using a ladder on tile, polished wood, or any other smooth floor, nail a

FIG. 2. ANTI-SLIP LADDER.

piece of sheet rubber (a piece of old auto tire or rubber fire hose will answer) on the bottom of the ladder legs at C and D, shown at E, Fig. 2. The two ideas can be used in combination on one ladder, if desired.

## MACHINES AND THE NEW MECHANIC

By R. I. N.

"WHAT is to be the status of the machine industry when peace is restored, and normal conditions again prevail?" It may probably be premature to dwell upon, but some considerations might not be out of place, regarding a few of the possibilities that may confront us at the expiration of present hostilities, in view of the fact that the unprecedented activities of the past two years have effected many changes, the extent of which will not be fully realized until the present crisis has been passed and our minds and bodies are permitted to resume their normal state of mental and physical action.

### Factors of the Coming Adjustment

The necessity of concentrated effort towards a common goal has so occupied the attention of every conscientious person that the train of thought has been kept on the main line, often allowing the side tracks to be overlooked, if not entirely forgotten. The favorable progress of events however, might well be considered as a good reason to review the equipment that will eventually be utilized for pre-war pursuits.

Two of the outstanding factors in the problem of post-war adaptation, will be the volume of machinery on the market and the new "mechanics" which abnormal conditions have produced. While both, at present, are apparently unknown quantities, their respective values can be more readily calculated in relation to the duration of war activities.

### Machines Depreciate, Operators Appreciate

It is quite obvious, owing to the special nature of the various operations of munitions manufacture and their confinement to certain tools, which are constantly being forced to their maximum capacity—that the value of the machines will depreciate much more rapidly than under ordinary conditions. On the other hand, the training that the army of shell workers are receiving at the present time, will fit large numbers for positions in the ranks of the "skilled" mechanics, when the country settles down to more peaceful pursuits. What effect these conditions will sub-

sequently have on the iron trade industry is as yet, a matter of conjecture; but with such an overflow of men, who for the past two years have been doing work that has called for keen judgment, accurate and sensitive manipulation of precision tools, it is safe to assume that the machine trade especially, will have to face a situation without precedent. The possibility of certain radical developments in methods of manufacture, may to some extent offset the changing conditions, but the future alone can reveal the ultimate solution.

### Loss of Skilled Help

During the incipient period of munitions making in this country manufacturers were called upon to utilize, to a great extent, their existing equipment, and the additional machinery then available was generally of standard design, the successful operation of which required a reasonable amount of skilled labor. Experienced mechanics at that time were becoming scarce, owing to the heavy enlistments for overseas service, which included men for British munition plants in addition to those for army purposes. The result of this drain upon the trained workmen was the immediate necessity of initiating the so called unskilled element into the "secrets" of the trade, in order that no obstacles should arise to prevent a continuous output of shells.

As the ever increasing need of unrestricted production was impressed upon the industrial interests here in Canada, firms already working on shells enlarged their plants and added to their equipment. Other establishments brought themselves into line, until the greater number of the leading engineering concerns—and many of the lesser firms—had entered into the work with such enthusiasm, that the ultimate results not only surprised those directly concerned, but proved of such a remarkable character, as to receive the praise and commendation of those in the old land, who had been making munitions for many years.

### Development of Mechanical Thought

The advent of this industry, on such an enormous scale, appeared to be the signal for the release of the latent energies of numerous mechanical men who were rapidly transformed into an active force, the power of which has been reflected in the large number of special machines, attachments, devices

etc., that have been designed and constructed for increasing the output, and decreasing the cost of production.

While the developments that have taken place in special machinery, for rapid and economical shell production, have been very remarkable, it is probably the changing status of the human factor that will eventually be a contender for first position, in the notable changes brought about as a result of the war and its various activities. It might be said, without exaggeration, that nearly fifty per cent. of those men now working on the manufacture of shells, had little or no knowledge of the operation of metal working machinery, before their entry to a munitions plant. Bakers who had been "loafers" all their lives, were required to work to the closest specifications; hair splitting barbers had to cut to gauge sizes instead of simply appearance; carpenters, accustomed to working to about one-eighth of an inch or more, were compelled to confine their measurements to much finer limits; in fact men who, in many respects were practically ignorant of even fairly accurate dimensions, were quickly initiated to the stage where thousandths of an inch, over or under a specified standard, might mean the scrapping of a shell. Many of the best workmen in shell plants to-day, are men who have had no previous experience in machine shop work, but have readily adapted themselves to existing conditions, with such characteristic ability, that their present capacity as mechanical prodigies is truly remarkable.

### Personal Aspects of Future Help

It might be said that the average man's energies, under present conditions are being confined to one, or probably two particular operations, and his future value as a mechanic would be insufficient for him to command attention under normal conditions. This may be true respecting many of the more intricate branches of the machine tool industry, such as variety job work, tool construction, jig making, die work, etc., where considerable fundamental knowledge is absolutely essential; but in the case of volume production, where quantity is the issue, these men, who have received a thorough training in the manipulation of special tools and close limit gauges, will be in a position

to enter any of these manufacturing establishments with the utmost confidence.

### Will Breaking In Be Necessary

It might be well therefore, for manufacturers and others to consider this phase of what promises to be a unique situation, as it is a well known fact that large sums of money are spent yearly in breaking in new men to certain lines of industry. While many of these erstwhile shell makers may be experienced enough to profitably fill a position as a machine operator on repetition work, it would be highly undesirable to engage offhand an "experienced mechanic" for various classes of machine tool work, where a fair knowledge of elementary principles is absolutely indispensable.

### CRITICISING OLD EMPLOYEES

by J. E. C.

IT is a well-known fact, that workmen who have grown old in the service of a company where they are still employed, often come in for a great deal of criticism. Every mechanic or writer who has any suggestion to make for rapid-production methods, greater efficiency etc., seldom fails to put along side his suggestion, some hint of discharging all old workmen, and, if they had their way, they would relegate them to some sort of "industrial boneyard." Some things have been said and written about old employees that has been unfair and greatly exaggerated.

Some of the faults attributed to them, may to a certain extent be true, but no one who has had experience in dealing with shop-help, would be willing to accept a statement that the older workmen have a monopoly on all the faults often ascribed to them.

### Retention Due to Value

A little investigation concerning aged employees in machine-shops will disclose many interesting and truthful facts, not generally or willingly conceded to them. While a few no doubt are past their "years of usefulness," so-called, a great many of them are still retained for reasons other than charity or sentiment, as a great many are inclined to think.

A few cases are here cited of old employees, who are still "making good" in a long established concern of machine manufacturers where they are still employed. The first of these to be mentioned, is a workman now 79 years of age, whose term of service in this particular factory is nearing the half century mark. His work consists in testing machines. He is an excellent workman, and a mechanic of the first

order. Besides his regular work, he can easily turn his hand to pattern-making and similar jobs. He is also something of a genius, as nearly all the improvements made in this factory in the past thirty years have come from him, and he is still capable of developing ideas.

### A Versatile Octogenarian

Another employee, 80 years old, is still an expert in filing and fitting. His work includes that of fitting heavy cross-slides, cutting spiral grooves in crank shaft boxes, fitting and driving fly-wheels keys and other work connected with engine-beds. He is handy in laying-out and cutting sheet-metal work, he can also do general blacksmithing, hardening and tempering tools etc.

The next aged employee is one who has reached his three score years and ten, and has a long record behind him of faithful service in this factory. He is an all-round drill-press hand, and can do a variety of drill work either with or without jigs, and knows all the "kinks" and "knacks" in this line, that the average machinists do not possess. He can easily scale a ladder, lace up and put on belts, take down and put up shafting and do any overhead work. He can splice a rope and tie any kind of knot. In work of jacking up and taking off heavy castings from planer beds etc., he renders timely and profitable aid, because he knows "the how" in doing work of this description such as blocking up, etc. He long ago learned the rudiments of "safety first," and has been several times the means of preventing many younger workmen from injuring themselves.

### Always on the Job.

It is seen from this short list of aged employees, that the reasons for still keeping them in employment, are entirely commercial, for each of them produces in his labor more than an equivalent in wages received. One other reason might also be attributed to their retention, and that is, that whenever and wherever any of their respective services are required, they are always "on the job" to undertake them. Faithful in the smallest tasks, and doing each of these to the best of their ability. And it can not be said of them, that they are always eyeing the boss, or watching the clock on the wall.

Younger workmen should learn to forbear with those few, whose weight of years sometimes make them appear peevish and cross. Older workmen, it is well-known, have shown a similar tolerance towards many of the younger help, namely in their immatured judgments and inexperience. Old age should be respected in machine shops, as well as elsewhere.

### MACHINISTS' INSTRUCTION COURSE—IX.

By J. Davies.

WHEN the tapered portion of a shaft is short and abrupt, it can be turned most conveniently by means of the compound rest, the setting of which can be done in a number of ways, in addition to the one just des-

FIG. 32.

cribed. The base of the compound rest is usually of circular form and graduated with degrees, so that it can readily be set to any desired angle.

### Taper Turning With Compound Rest

If the angle of the job is given, it is a simple matter to set over the compound rest half the amount of the total taper. When the angle in degrees of a taper is not known it may be found by laying off the dimensions on a piece of drawing paper or tin. Make a horizontal line AB, Fig. 32, equal to length of taper, then a vertical line, AC, equal to half the difference of the diameter. Complete the triangle and measure with a protractor, or transfer the angle with a bevel, placing the stock of the bevel against the face plate or side of the carriage if it is machined, and the blade against the cross slide, as shown in Fig. 33. This is a convenient method for

FIG. 33.

boring taper holes. If the drawing is correctly executed, you can transfer the angle direct from the drawing with sufficient accuracy to take a roughing cut.

Another method is to get a piece of galvanized iron or tin and make a circle equal in diameter to the base of the compound rest, then make a horizontal line equal in length to the taper re-

quired, measuring from the centre of the circle.

At the end of the horizontal line measure off the amount of the taper and complete the triangle, Fig. 34. To apply this, measure the width of the angle from the centre line with dividers, where the angle cuts the base circle, put one point of the dividers on the stationary zero mark of the rest and swing the rest around until the movable zero mark coincides with the other point of the dividers. Don't throw this template away because the diameter of the base is always the same for the one lathe and a large number of tapers can be marked off on the same template and kept for reference.

#### Using the Taper Attachment

Many modern lathes are fitted with a taper attachment, which is a device for moving the tool in or out as it travels along the work. The graduations on this type of attachment usually indicate a taper of  $\frac{1}{8}$  in. per ft., so that to set the attachment for a taper of  $\frac{5}{8}$  in. per ft., it would set the attachment over 5 marks.

FIG. 34.

It has several advantages over the other methods of turning a taper; for instance, when the taper is once set it will turn the same taper on any piece regardless of the length, while the lathe centres are always in line and make a better job. When changing from straight work to taper, it is advisable to start the cut an inch or so beyond the end of the work and move the carriage up by hand to take out any lost motion there may be in the slide.

#### Height of Tools

No matter what method is used in turning taper, it is important to set the tool exactly level with the centre, and this can be done quite readily by using the mark on the tailstock. If the tool is set on the centre of the work and a cut taken off, and then the tool taken out and not put back at the same height, the taper of the work will be altered. If we should put the tool a little high it will take more off the large end, as will be seen by reference to diagram, Fig. 35, in which AB represents the path of the tool when correctly set at the centre, the small circle being the diameter of the small end of taper, and the large end the diameter of the large end of taper. Sup-

posing the tool is raised above the centres to the line CD, it is seen that owing to the flatter surface of the large end, it is much nearer to the tool than the small end, looking along the line CD, which is now the path of the tool, so that it would alter the taper by taking more off the large end.

FIG. 35.

This fact can sometimes be used to advantage—the job in hand might be the least bit big at the large end, so, instead of moving the taper attachment raise the tool a little to take a little more off the big end.

#### Fitting a Tapered Piece

After roughing out a tapered piece it should be tried in the place it is intended to fit, taking care to leave it sufficiently above size to allow for fitting the taper. If one end is much too small it can be detected by rocking the work in the hole. After fitting till there is no perceptible play in the hole make a series of marks along the length of the taper with chalk or Prussian blue, place the work in the hole and give it a turn round by hand. The marks will be rubbed off the high spots and the taper attachment should be adjusted until the marks show a full bearing along the surface of the taper.

After fitting the taper satisfactorily, measure carefully how much further the taper needs to go into the hole to be in its right place. Suppose Fig. 36 is fitted correctly into the hole, but it requires to go  $\frac{1}{2}$  in. further in to be in its right place; measure with the calipers very carefully the diameter of the

FIG. 36.

taper at the small end of the shaft, then take off a little cut and test with the calipers until the work is the same size as the calipers  $\frac{1}{2}$  in. from the end. By

this means, after getting the taper a good fit, you can get it the correct size at the next trial. It is better to err a little on the full size, as you can then give it a rub or two with a file, but if too small there is no remedy.

#### Filing and Polishing

Don't leave any more stock for filing on lathe work generally than is necessary to remove the tool marks; in fact, if you can get a good smooth finishing cut it is best not to file it at all.

The best files for lathe work are mill files. These are single cut files that are not so liable to collect the filings into little balls called catspaws, that choke up the teeth, as is the case with double cut files. Look out for these catspaws or they will scratch the work at every stroke of the file. Clean the file well with a file card; rubbing on chalk also helps to keep it clean.

To keep the work round and true, file with a long steady stroke, aiming to allow the work to make a number of revolutions for each stroke of the file. If the work should need polishing, very useful polishing sticks can easily be made as shown in Fig. 37. It is simply two pieces of wood with a hole cut out the

FIG. 37.

size of the shaft, and fastened together at the back with a leather hinge. Polish either with emery cloth, or emery powder and oil, run the lathe at top speed and ease back the centres while polishing, because the heat generated in polishing may cause the job to expand and run out of true or twist the end of the centre.

#### Using the Steady Head

Sometimes if the job is a very long one, it will have to be supported with a steady head to prevent it chattering and springing away from the tool, but before using the steady head you must have a true spot to put it on. Turn a place near the centre if possible by using a narrow tool and fine feed, setting the tool well above the centre. If you cannot turn a true spot in the desired position on account of the shaft being so slender, turn one as near to it as possible, put on the steady head and turn another spot until you get the steady head in the right place.

Make sure that the spot turned for the steady head runs perfectly true or the work will not be true when finished. To adjust the jaws of the steady head without springing the work close each jaw on the work until they will just grip a strip of paper or a thin feeler, then close each jaw the least bit more and adjust for a running fit.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## HYDRAULIC BANDING EQUIPMENT WITH HORIZONTAL TRIPLEX PUMP

A COMPLETE unit for shell banding work, consisting of press, pump and operating valve, is shown in the accompanying illustration. The press, which is capable of exerting a total pressure of 950 tons when working at a maximum

x 2 in. wide, while the solid crosshead is fitted with adjustable phosphor bronze bearings. Pump bodies are of hydraulic bronze tested to 50 per cent. over load.

The pump is fitted with driving pulley 30 in. dia. x 6 in. face running at 180 revs. per min. and weighs 3,300 lbs.

The complete equipment is product of the Metalwood Mfg. Co., Detroit, Mich.

rock-over valve is opened. As soon as the arms start upward in the rolling over operation, they are automatically locked to the pattern board by means of sliding pins. This takes place as soon as the arms move upward  $\frac{1}{4}$  in., so all danger of the pattern board slipping is absolutely eliminated. The rolling over operation is accomplished by means of a 16 in. air cylinder acting in both directions on a crank.

When the mould is rolled over it hangs suspended by the arms over the leveling and pattern drawing device. This device consists of the Mumford fluid pressure plunger, an apparatus which has been thoroughly tested out in the Mumford Split Pattern Machines where it is also used for drawing the pattern. In operation the draw plunger raises up the leveling device to a height of 16 in., the maximum draft, when a stud opens a pop valve releasing four leveling pins which rise independently of each other until they strike the bottom board of the flask. As they are independent of each other any inequality in the surface of the board is automatically taken up, and the pins being 22 in. in length, no adjustment is necessary for shallow or deep flasks; considerable saving of time is also effected where work of varied depths is being run. When the pins have

BANDING PRESS FOR 12-IN. SHELLS WITH HORIZONTAL TRIPLEX HYDRAULIC PUMP.

of 3,500 lbs. per sq. in., is suitable for banding shells from 6 in. to 12 in. size. It is constructed with 6 semi-steel rams, having a diameter of 11 in. and bearings 9 in. long. The rams are fitted with chrome leather U packing, and have a movement of  $\frac{1}{2}$  in. each, or more if necessary. The return of the rams is effected by means of heavy steel springs acting on levers which provide adjustment for tension.

All parts of the press subject to severe stresses, including cylinders are alloy steel castings or forgings. The dies are of forged chrome nickel steel, hardened, and can be removed by loosening two nuts without disturbing any part of the press.

The cylinders are removable and have a hydraulic inlet of  $1\frac{1}{4}$  in. pipe, the distributing ring being 2 in. pipe. The weight of this press is 9,500 lbs. and it can also be operated from an accumulator if desired.

The pump illustrated is of the triple type, having three plungers of 3 in. stroke, and of diameter to suit the pressure, made of hardened and ground tool steel for use with oil, or of Tobin bronze for use with water. Removable poppet valves permit easy inspection of discharge or suction.

Alloy steel is employed for the cam shaft, which is carried in split phosphor bronze bearings mounted in a semi-steel enclosed self-oiling base. Connecting rods are of forged steel, with babitted cam bearings  $5\frac{1}{2}$  in. dia.

## NEW JOLT ROLL-OVER DRAW MOULDING MACHINE

THE accompanying illustration shows a new jolt roll-over draw moulding machine which was exhibited at the recent convention of the American Foundrymen's Association in Cleveland, by the builders, the E. H. Mumford Co., Elizabeth, N.J. A large range of work can be performed in the machine which can take a 37 x 48 in. flask and has a 16-in. draw. The machine is operated in the following manner:—

The pattern board is placed directly on the jolt rammer table by means of a positive spring locking device, thus doing away with the usual floating plate arrangement. After the flask is filled it is rammed up by the jolt machine which is a standard Mumford machine having 10-in. cylinder, and capacity to ram half moulds weighing 3,700 lbs. at 80 lbs. air pressure. When the ramming process is complete the mould is clamped to the pattern board, and the

JOLT ROLL-OVER DRAW MACHINE.

come to rest under the bottom board they are locked by means of an air clamp from the operating position. This clamp exerts a pressure of three tons

on each separate pin, thus assuring a rigid rest for the flask. Hand levers for locking the pattern board to the arms, and also for locking the leveling device, have been entirely done away with. The operator need not move from the valve position to complete every operation.

When the flask has been leveled by the above means, the pattern is then drawn through oil by means of the fluid pressure plunger before mentioned. This device insures a steady even draft under all conditions, as the oil in the cylinder has to pass through a very small hole in order to let the plunger down. The machine is operated by means of only five valves in all, and these are placed in consecutive order so that passing from one operation to the next is easily indicated by their position.

### STEAM TURBINE DRIVEN INDUCED DRAFT FANS

THE high degree of perfection now obtainable in high-speed reduction gears is resulting in the adoption of steam turbines as the motive power for such items of boiler house equipment as induced draft fans. The simplicity and reliability of steam turbines renders them very suitable for boiler-room service, but until high-speed gears were commercially available, their relatively high speed had prevented the extensive use of steam turbines for the fans referred to, as such fans on account of the large volumes handled are usually of relatively slow speed.

Two recent installations of turbine-driven fans are shown in Figs. 1 and 2, the turbines being built by the Terry Steam Turbine Co., Hartford, Conn., and the fans by the Green Fuel Economiser Co., Beacon, N.Y. These fans are driven through herring-bone reduction gears, the unit in Fig. 2 having a ratio of 6.78 to 1, with a maximum pinion speed of 3,630 revs. per min. Fans for this class of work require from 25 to 50 horse-power, and give a draft of from 2 in. to 5 in.

steam is passed repeatedly through a single row of moving buckets, this design permitting the use of a wheel made from a single steel forging with buckets milled from the solid.

### NEW TYPE LOCK NUT

A LOCK NUT in which the dead and not the moving member is locked has been developed by the Western Screw & Lock Nut Co., San Francisco, Cal. With this nut no washers are required and the

NEW TYPE LOCK NUT

nut can be locked at any point on the bolt, an arrangement which makes it possible to take care of oscillating or pulsating movements. The bolt and nut can be used over and over several times, it is claimed, without damaging the threads. It is possible also to fit a United States standard nut tightly on a bolt having a V-thread, and it is also possible to make a nut tight on a loose fit bolt.

The lock nut consists of two members. The lower, which is the nut proper, is similar in form to a regular hexagon nut and has four flexible finger members projecting from its upper surface. When the upper or locking member is screwed down, these fingers are compressed and the nut is frozen, as it were, to the bolt. The locking action is secured by turning the locking member firmly. When locked in place this member is counted on to help carry the load. One of the features

member is released it will of course move as one of the ordinary type.

A recent test of the holding power of one of these nuts was made by bolting two pieces of  $\frac{3}{4}$  x  $1\frac{1}{2}$ -in. bar steel together with a  $\frac{3}{4}$ -in. lock nut and one of the ordinary type placed 6 in. apart. The steel bars were suspended on heavy springs and an air hammer delivered 500 blows per minute with a force of 25 lbs. midway between the two bolts. It is stated that the ordinary nut was jarred off in a short time, thus leaving the strain on the other bolt. After 9 hours of continuous jarring at this rate the lock nut was still gripping firmly.

### SHELL NOSE DRIVING MACHINE

THE accompanying line cut illustrates a machine of British manufacture which has been designed for the purpose of driving on the threaded nose pieces of shells. The compact arrangement calls for comment as also the method of using a fly-wheel for imparting the final jerk which insures perfect tightness.

The machine consists of a vertical box-shaped frame on top of which is mounted a pulley driven drive shaft carrying a worm which engages with a worm gear carried in the upper part of the frame. Through the worm gear passes the splined shaft A, counterbalanced by weight B. On one end of the drive shaft is secured the fly wheel C, while on the other end is mounted the belt pulley D which drives the shaft through the medium of a spring controlled dog clutch.

The boss of the pulley has beveled clutch teeth formed on it which engage similar teeth on the sliding sleeve E, which in turn is keyed to the shaft and kept engaged with the pulley by means of a helical spring which can be adjusted by nuts F.

According to the pressure of the spring the beveled clutch teeth will disengage at any predetermined resistance, at which point the stored-up energy in fly wheel C comes into play and spends

FIG. 1. STEAM TURBINE-DRIVEN INDUCED DRAFT FAN WITH GEAR REDUCTION.

FIG. 2. FAN WITH CASING REMOVED, SHOWING CONSTRUCTION OF IMPELLER.

On account of the warm location the bearings of both fan and turbine are water cooled. The turbines are of the Terry helical flow type in which the

of the lower member is a number of threads which provide capacity to carry the load. The nut is released with an ordinary wrench, and when the locking

itself in exerting a final effort on the tightened nose piece.

The shell is held in a hinged vise G of a type familiar to shell makers, while

the method of driving the nose piece by shaft A is as follows: A hexagonal box coupling K is fixed to the end of shaft A, and engages with the upper end of the blind nut L, the bottom end of which is tapped with a  $\frac{1}{2}$  in. pitch right hand square thread. The stud M has its upper end threaded to suit the  $\frac{1}{2}$  in. pitch thread, and its lower end is threaded to

been sunk by belligerent nations during the twenty-seven months of war ending November 1, according to figures compiled from cable despatches and mail advices published in New York on November 1, by the Journal of Commerce. The losses during October were larger than for any one of the preceding five months, according to the statistics, amounting to

per, 10 per cent. lead, 1 pennyweight gold and 10 ounces silver. It is characterized by mining engineers, who have recently made an examination, as one of the most spectacular showings in Canada. A second vein, 15 feet wide, has been traced for 1,000 feet, and carries 34 per cent. zinc, 3 per cent. copper and 2 per cent. lead.

BELT DRIVEN MACHINE FOR TIGHTENING SHELL NOSE-PIECES.

suit the nose-piece, while passing freely over the stud M is a cup shaped washer N, which is recessed to fit the profile of the nose-piece.

When using the device, the stud M is screwed home within the blind nut L, and washer N slipped over the stud M which is then screwed into the nose-piece after which the shell is placed in the vise, with the nut L engaging coupling K. The driving power of shaft A is now imparted to the nose-piece through the friction of washer N against the nose.

To release the coupling, the nut L is turned back by hand which is readily done, due to the coarse pitch of its thread, compared with the thread in the nose-piece. The stop P holds the shaft A clear of the work while the shell is being adjusted. The makers of this machine are Pollock & Maenab, Ltd., Bredbury, Lanes.

## THE WAR AND MERCHANT SHIPPING

ONE thousand eight hundred and twenty ships, with an aggregate gross tonnage of approximately 3,328,584, have

127 vessels of a total of 227,116 tons gross. The October rate of destruction was considerably in excess of the monthly average throughout the war period. Norway lost the largest number of ships—56, according to the statistics, but their gross tonnage was only 57,333, as compared with Great Britain's total loss of 115,546 gross tons of 38 vessels destroyed.

## ZINC MINE DEVELOPMENT IN CAPE BRETON

WHAT is stated to be a very rich zinc deposit is now being opened up by Toronto interests in Cape Breton, about 30 miles north-west of North Sydney, in the heart of the Nova Scotia mining district. Surface showings are rich, and it would appear that an extensive zinc and copper producing mine will be developed as a result of the extensive plan of operations now being prepared.

The main vein on the property is 60 feet wide, and has been opened up for a distance of two miles. The ore is almost solid metal, assay returns showing 34 per cent. zinc,  $2\frac{1}{2}$  to  $4\frac{1}{2}$  per cent. cop-

## BRITAIN BECOMING INDEPENDENT OF FOREIGN STEEL

DR. ADDISON, one of the chief officials of the British Ministry of Munitions, told a party of journalists visiting Woolwich Arsenal on November 2, that he calculated Great Britain would be entirely independent of foreign steel supplies by March, 1917. During the Somme offensive the expenditure on armaments was about ten times the weekly rate on what it was in the month of January, but there are more filled shells in France now than there were at the beginning of the war. With special reference to the steel supply, Dr. Addison said the more Britain was dependent upon neutral countries the more was she waging war at a disadvantage. One of the advantages of making things at home was to save vast sums of money apart altogether from what was lost on exchange. He gave an interesting forecast, which was that as Britain was providing an extension of steel works at a probable saving of something like six millions a year, she would have provided a programme satisfactorily developed to be entirely independent of foreign steel supplies by March next.

## SOME DEMONSTRATION!

A LAWYER tells this story of himself and his efforts to correct the manners of his office boy. One morning the young autocrat came into the office, and tossing his cap at a hook, exclaimed:—

"Say, Mr. Jones, there's a ball game down at the park to-day, and I'm going."

The lawyer thought he would teach him a lesson.

"Harry," he said, "that isn't the way to ask a favor. Now, you come over here and sit down, and I'll show you how to do it."

The boy took the office chair, and his employer picked up the cap and stepped outside. He then opened the door softly, and, holding the cap in his hand, said quietly to the boy in the chair:—

"Please, sir, there is a ball game at the park to-day. If you could spare me, I would like to get away for the afternoon."

Whereupon the boy replied:—

"Why, certainly, Harry; and here is 50 cents to pay your way in."—N. Y. Times.

### LABOR DILUTION IN METAL-WORKING PLANTS MAKING GOOD

THE employment of female labor in our metal-working industries continues to expand at a satisfactory rate, both as regards numbers of operatives, and individual plants taking advantage of their services. Equally satisfactory are the results being achieved in the matters of product quality and quantity output, so much so that firms who were at one time skeptical of the wisdom of even experimenting with the proposition are now actively preparing to adopt it in generous measure. What has already been accomplished, is, we believe, little criterion of what may be expected within say the next six months or even less. The accompanying data relative to female labor in metal-working industries in Great Britain provides something in the nature of an eye-opener, and in equal degree an inspiration to our plant executives whose energies are being concentrated in the like direction:

According to the president of the Institution of Automobile Engineers, in some of the National factories set up by the Ministry of Munitions the female labor amounts to as much as 95 per cent. of the total. Nor, he says, has dilution only been applied to those classes of work in which repetition by the million or by the thousand takes place. It has been found that very many other classes of work can be done after but short training, by men previously reckoned unskilled, and particularly by women. In engineering shops, women are already doing drilling, boring, shaping, slotting, key-seating, milling, surface grinding, universal grinding, tool-setting, fitting, skilled assembling, and erecting. They are, moreover, making equal progress in such industries as wood-working, aeroplane-building, boiler-making, laboratory work, optical work, and instrument making, as well as in nearly all branches of ordnance, small arms, shell and explosive work.

They have also successfully taken up such occupations as driving overhead traveling cranes, shipyard and building cranes, motor testing, inspecting and testing materials of all descriptions, involving the use of micrometers, verniers, surface gauges, and other measuring instruments, including the slide-rule. So wide, in fact, has the scope of female labor become that a well-known member of the Institution of Automobile Engineers, who has taken a leading part in the dilution campaign, recently stated it to be his firm conviction that, given two more years of war, he

could build a battleship, from keel to aerial in all its complex detail and ready for trial, entirely by female labor. Some development!

### POST WAR PROBLEM PLANS

IN all discussions of the post war problems that Canada will be called upon to solve, least, if any prominence, is given the possibility of her future development being retarded through lack of co-operation by labor. This is perhaps the most promising feature of the present and future outlook, more or less harsh restrictive measures by trade unions being neither meantime operative nor projected. That considerable importance is attached to the labor outlook in Great Britain is evidenced by the anxiety of manufacturers there to associate themselves in the establishment of a mutual trust and forward effort movement with the representatives of labor.

Just as the institutions and laws of Britain have served as models and patterns in the development of world civil-emergency wares at present. The great essentials of in-examined for landmarks and sign posts whereby the expanding activities of budding nations such as ours may emulate to some extent the achievements of her, the Mother of Nations. Towards the present rather than the past, however, must our attention be directed so that the keen and mature experience available may be advantageously appropriated.

Perhaps the most outstanding feature of the present movement in Britain is the united and whole-hearted manner in which all public bodies, institutes, associations and industrial undertakings are endeavoring to find a solution for the problem of post-war industrial settlement. At a recent conference held at the Mansion House, the Lord Mayor of London moved the following resolution: "That this meeting expresses its appreciation of the great national service being rendered by the munition workers of the country, whose patriotic support of our fighting forces on land and sea is hastening the achievement of final victory, and expresses the hope that permanent remunerative employment will be secured in the vigorous economic development of the engineering industry after the war." The earnestness with which such matters are now regarded is apparent from the fact that presidents and members of more than a score of Institutions, Associations, Universities, Municipal Authorities and Public Companies attended, representing an approximate engineering capitalization of \$2,000,000,000.

In order to prevent public demand from drifting back to former foreign channels, it is necessary to realize that the public be educated to the real facts of the situation and be brought to see that self-support, charity notwithstanding, begins at home. Producers must be prepared to devote at least as much energy to the output of staple lines in the future as they are devoting to the output of emergency wares at present. The great essentials of industrial and commercial success are what to make and where to sell, and a proper appreciation of such constitutes the starting point for achievement.

The development of natural sources of wealth is without question the most desirable direction in which Canada can build up a worth-while material prosperity. In his inaugural address as President of the Royal Canadian Institute, a few days ago, Professor J. C. McLennan pointed out that the three chief sources of wealth of this Dominion are agricultural lands, electrical power and mineral deposits. To develop these in the fullest measure, and to the extent which present and pending events indicate as being necessary to meet future world demands—is the work which lies before us, and our engineering industries with their new born sense of fitness and capacity for accomplishment are expected to "blaze the trail."

## INDUSTRIAL NOTABILITIES

**H**ENRY DUFF REID, vice-president and treasurer, Reid-Newfoundland Co., railway and steamship owners, St. John's Dry Docks, was born in New South Wales, Australia, Jan. 29, 1869, the son of Sir Robert G. and Harriet (Duff) Reid. In 1873 he came to Canada, receiving in course his education in various Ontario Public Schools. His association with Newfoundland, dates from the year 1890. Prominent among his business experiences

HENRY DUFF REID.

and official appointments are the following: Spent three years farming with his father in Northern Minnesota; assisted father and brother in building railways, Cape Breton, N.S., for a short time; his firm undertaking the construction of Hall's Bay Railway and the extension to Port aux Basques, in 1890, and completing same in 1897. He became director, secretary, and assistant general manager of The Reid-Newfoundland Co. formed in 1901, and became vice-president and treasurer on Sir R. G. Reid's death in 1908.

Mr. Reid married Jessie Patterson, daughter of John Patterson, Scotland, Nov. 4, 1894, by whom he has two daughters. His Clubs are: City; St. John's; Golf and Country (life member); Royal Automobile (London, England); his society, A. F. & A. M.; his recreations, golf motoring, fishing, hunting, curling. In politics he is neutral, and in religion, Presbyterian. His address is "Devon Place," St. John's, Newfoundland.

Prices Per Lb. Unless Otherwise Stated.

quotations on plates. Sizes ¼-inch to ½-inch are now \$5, an advance of 25c per hundred. Heads show an advance of 35c, being quoted at \$5.35. Tank plates, 3-16 inch, are \$5.25. The market in sheets is very active, but production is somewhat delayed, owing to the scarcity of raw material. An advance of \$3 per ton has recently been placed on black sheets, Pittsburg; the price being now \$3.75 per hundred. Tin mill black, Pittsburg, is now \$4, an advance of \$10 per ton. Tin plate shows a similar advance, the current quotation being \$6.50. Should the heavy demand for wire products continue, a further advance is anticipated. No definite delivery can be given on iron or steel bars. The Chicago quotation on steel bars is higher, the price of 2.889c being an advance of \$2 per ton. Wrought iron pipe and boiler tubes are very active, local dealers having revised their lists on the latter; prices now range from \$30 for 1 inch to \$60 for 4-inch tubes. A feature of the situation is the high cost of coke, furnace spot being now \$7.25, and foundry \$8.50 for immediate delivery.

## Metals

The general market continues to retain its strong position. Recent activity in copper has added to the strength of this metal. Tin is quiet but firm. Spelter is showing steady improvement, with an undertone of further activity. Lead is quiet, but retains its usual strength. Antimony is dull, and aluminum is quiet, but strong.

**Copper.**—The recent activity has added strength to the market, slight advances being reported from New York, and the tendency is for still higher prices. The London situation is well maintained, with standard spot showing a slight decline. New York prices have advanced ½c on prime lake and ¼c on electrolytic and castings; present quotations being 25½c for lake, 29c for electrolytic, and 27½c for castings. Dealers here report a very steady market, with prices firm and unchanged at 31c for lake and electrolytic and 30c for castings.

**Tin.**—Available metal is at present rather scarce, but the visible supply is apparently sufficient to maintain a steady market. Both London and New York have weakened in their latest quotations; the latter having declined ½c, lowering the quotation to 41¾c per lb. The local market is unchanged, with prices firm at 45c per pound.

**Spelter.**—The steady demand is beginning to reduce the supply on the market, and the present undertone points to higher prices. Galvanizers are showing increased interest, and inquiries from these sources are showing improvement. London quotations are a little easier, while New York reports an advance of ¾c; the current price being 10¾c per

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

**Montreal, Que., Nov. 6, 1916.**—The abnormal condition prevailing throughout the steel industry is still the dominating factor in industrial circles and receives continual emphasis daily. The scarcity of labor, while not so pronounced as a few weeks ago, is nevertheless sufficient to curtail the maximum possible production.

## Pig Iron

The situation in pig iron continues to reflect the pressure under which the steel industry is still working, further advances in many grades being reported. Local dealers are now quoting \$31.25 for Victoria, an advance of \$1 per ton.

## Steel

The demands on producers for shell requirements are so insistent that mills are unable to satisfy the urgent needs of other lines. The increased demand for domestic steel, that is expected to follow the slackening of shell requirements, will prevent any marked decline for some little time. The Pittsburg quotation on sheet bars is now \$52 a ton, an advance of \$2. Fair-sized business is reported in steel rails. Plates are still active, but the supply is not sufficient to meet requirements. Following the advances that have been prevalent in the States, local dealers have revised their

lb. The local situation remains unchanged, with prices strong at 13c per lb.

**Lead.**—The market is very quiet, but firm. Owing to the evident scarcity of nearby metal, the dullness of the present situation has had little effect and prices are being well maintained. Dealers here report prices unchanged at 9c per lb.

**Antimony.**—Indications point to easier prices, although present quotations are holding firm. New York is still quoting 13½c; and local dealers are asking 15c on a quiet market.

**Aluminum.**—The market is not active, but local quotations have again returned to 70c, being an advance of 1c on the week.

### Machine Tools and Supplies

While the demand for machine tools is gradually resuming more normal proportions, there is still sufficient business passing to keep builders interested. Standard equipment is still in demand, but the bulk of the inquiries and orders are for special equipment. Owing to the high cost of labor and raw materials, prices on manufactured equipment are well maintained. The continued advance in steel and semi-finished products will probably have an early effect on many of the smaller tools, such as taps, dies, drills, etc.

### Scrap

Old materials have continued very firm, and much activity is reported in all lines, more especially in old coppers. Local dealers are quoting higher on light copper, this week's price of 20c showing an advance of 1c per lb. The demand for lead is quite heavy, and prices are stronger by ½c per lb.; heavy lead is now 7c, and tea lead is 5½c. All other scrap is firm at last week's prices.

**Toronto, Ont., Nov. 7.**—An interesting feature to note is the renewed activity in the machine tool business. The demand for machine tools for shell plants although comparatively good for some time had been gradually falling off, due of course to the fact that practically all the shops were well equipped and only required occasionally an extra machine or so to increase production or as a replacement. The munitions industry now having more nearly got into its stride, the output is rapidly increasing and more orders are being placed for shells. The situation at present seems to be that there is no limit to the orders so long as the output reaches a volume satisfactory to the British Government. Notwithstanding the large number of plants engaged on munitions, new firms are still coming into the arena and the older concerns are extending their plants. This expansion means a bigger demand for ma-

chine tools and is the reason for the revival in this important industry.

### Steel

The withdrawal of prices in Canada by the U.S. Steel Corporation in their products is the latest development in the steel trade. Not that this makes any material change in the situation, but it is further evidence of the tight conditions which prevail in the steel market all over this continent. The shortage of steel is steadily becoming more acute and may at no distant date assume serious proportions. With the output of shells increasing, the demand for steel for this purpose becomes proportionately greater. The Imperial Munitions Board has the first call on all steel produced and the result is that other branches of the trade suffer. Steel rails for instance are badly wanted but cannot be rolled in large enough

### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

tonnages to meet the demand owing to the urgent need for steel for munitions. Prices, although they reached record levels some months ago are still climbing and the mills are getting further behind on deliveries. The demand for ship plates is getting heavier and extraordinary prices are being paid to get quick delivery. Minimum prices quoted are for delivery at mill convenience which would be at least twelve months, the mills being fairly swamped with orders. Lap welded tubes have advanced in the States, so higher prices may be expected here. Wrought pipe has also advanced, affecting lapweld only, owing to the higher prices of raw material. Wire products including wire nails have advanced 15c. All wire products being affected. Plain wire is now \$4.40 per 100 lbs. and wire nails \$4.10 per keg. The possibility of higher prices on iron bars would affect nuts, bolts and rivets.

As was anticipated, prices on galvanized sheets have reacted and are now advancing. Prices of black sheets are going steadily upward which is affecting galvanized material. The leading interest in the States recently advanced

the price of galvanized sheets \$10 per ton; the affect of this is now being felt in this market. "Premier" No. 28 U.S. gauge are now quoted at \$6.50, and "Premier" 10¾ oz. at \$6.75 per 100 lbs. Black sheets No. 28, gauge are quoted at \$4.30, and No. 10, at \$5.20 per 100 lbs. The mills are practically sold up on black sheets for the first quarter of 1917.

The steel market in the U.S. is growing stronger and a further advance in finished steel prices is expected soon. Steel companies are getting many orders offered to them, as has been the case for months, which they are not able to accept. The situation is so tight that the principal concern of buyers is to get their orders placed at any price and to hasten deliveries. Export enquiries continue in heavy volume particularly for billets, bars, rails and structural shapes. Chicago warehouse prices have advanced, steel bars being now 3.35c, shapes 3.35c and plates 4c per lb.

### Pig Iron

All quotations on domestic pig iron have been withdrawn until further notice pending an upward revision of prices. Pig iron is now being quoted at \$27 per ton in Buffalo, N.Y., which is an indication of what local prices will be. The pig iron market is in an excited condition in the States and prices continue to advance. At Buffalo for the first time in years the stocks of pig iron are practically cleaned out and prices are more or less nominal. The serious shortage of coke, labor and cars all go to make up the present strained situation with little or no sign of relief in sight. Grey forge is now quoted at \$21.45; Bessemer \$26.95; basic \$23.95 per ton all f.o.b. Pittsburgh, with high silicon pig \$25 to \$27, and foundry grades \$24 to \$26 per ton Buffalo.

### Scrap

The market for scrap material is firm and generally steady at unchanged prices. Steel turnings and borings however, are weak as the supply is greater than the consumption. The offerings of this material are heavy but the demand is light. Heavy melting steel continues active and in good demand at unchanged prices, while there is also a good demand for scrap copper.

### Coal and Coke

A serious situation has developed in the coal trade owing to shortage and consequent advance in prices. It appears that the comparative scarcity of miners in the coal mining districts in the States has caused a decrease in output and the unusually heavy demand particularly in New England has resulted in a shortage of supply for Can-

ada. With regard to hard coal, if the present shortage becomes more acute, prices will advance. The situation is more serious in soft-coal, supplies are scarce and prices are already advancing. The prices in the current market quotations have been withdrawn pending a return to more stable conditions. The market is very unsettled and prices entirely nominal. The extraordinary prices of coke now prevailing are due principally to car and labor shortages.

### Machine Tools

Renewed activity continues in the machine tool market as a result of orders recently placed for shrapnel shells and fuses. Local machinery houses report a brisk demand for screw machines, bench millers and small high speed drills, manufacturers stocks having been practically cleaned out. There had not been a very heavy demand previously for this class of equipment, so dealers had little difficulty in filling orders. The capacity of some of the plants working on 6 in. shells is being doubled and extensions in other plants are frequent, with the result that there has been and still is, a good volume of business passing in machine tools. The recent call for more 18 pounder high explosive shells, a size not now being made here, will create a demand for suitable tools such as were employed when these shells were being produced a year ago. For some time American builders of standard types of machine tools had been getting these made in outside plants owing to the big rush of business. They are now making all their tools again with the result that the quality of the product has improved but deliveries are slower. Canadian machine tool builders are very busy and have all the business they can take care of for months. Prices are still high and in some lines are advancing. In the U.S., machine tool builders in the East have advanced prices 10 per cent. on planers, shapers and radial drills, while one firm has made an increase of 25 per cent. on boring and turning mills. Advances on several machines have also been made by manufacturers in the Middle West. There is little change in the situation as regards deliveries. Milling machines can be obtained in about six months. Small lathes, radial drills and some machines of lighter type are fairly easy to obtain, but deliveries on heavy equipment, such as heavy lathes and planers run into eight or nine months.

### Supplies

There is practically no change in the situation. Business continues good and prices are very firm with a decided upward tendency. Stocks on some lines of

supplies are low on account of slow deliveries.

### Metals

The metal markets continue steady and in most cases firm, antimony being the only metal to show any indication of weakness. The copper situation is still the principal feature of interest and higher prices are looked for. The demand for copper is very heavy and few producers hold any metal for the first quarter of 1917. Tin advanced sharply a few days ago in London but local prices have not been affected as yet. The spelter situation has improved and quotations are holding firm with producers still disinclined to sell freely. Antimony is easy and business quiet, while aluminum is firm at unchanged prices.

**Copper.**—The export and domestic demand for copper continues heavy, and some sellers have disposed of all their production up to July 1917, while few have any metal for sale until after the first quarter. Some sellers report that the volume of business is only limited by the amount of copper available. Consumers are taking copper wherever they can secure it regardless of price. The market is thus very strong and a further advance would not be surprising. Local quotations are firm at 31c per pound for lake and electrolytic, and 30c for castings copper.

**Tin.**—Although tin advanced recently in London, the reason not being explained, the local market is unchanged. The situation in New York appears to be somewhat complicated and the increase in the visible supply has not depressed the market as is usually the case. Permits to ship tin from London to New York are still difficult to obtain. Local quotations are firm at 46c per pound.

**Spelter.**—The market continues strong and producers are reported to be still disinclined to sell freely, believing that prices will go higher as the price of ore has advanced about \$7.50 per ton, thus increasing the cost of producing spelter. Prices are firm locally and unchanged at 14c per pound.

**Lead.**—Quotations are firm but the market continues quiet, although there are indications of more activity in the near future. The leading interest continues to quote 7c New York. Lead is unchanged at 9c per pound.

**Antimony.**—The market is easier and business dull. Quotations are unchanged at 18c per pound.

**Aluminum.**—The demand is rather quiet but the market is steady at unchanged quotations. Local price 68c per pound.

### Pig Iron Advance

As we go to press, word has been received that "Hamilton" pig iron has advanced \$2 per ton.

### SHIPPING AND WAR

IT is no longer a novelty to learn of ships earning their first cost from one year's freights. In the past two years freights have doubled, trebled and in certain instances increased ten-fold over the figures which obtained at the outbreak of the war. While high cost of labor and materials, reflected in operating costs, have had an influence in increasing freight rates, the three main causes are the requisitioning, especially by the British Government, of merchant vessels for war purposes, the internment of ships of the Central Powers, and the decrease in tonnage due to the submarine campaign. Over fifty per cent. of British registered tonnage has at some time or other been devoted to the military needs of the Allies. It is estimated that during the war period, the steam tonnage on Lloyd's Register as of July, 1914, has been reduced from 24,809,000 tons of 13,158,000 tons. In other words, making due allowance for new tonnage added, the depletion through Government requisitions, internment and war losses, has cut the available tonnage practically in two. The tremendous demand for cargo space has put into commission, on a very profitable basis, vessels which prior to the war could hardly pay their keep. This movement, while applying generally to neutral shipping is specially marked in the United States and the Scandinavian countries.

### LACHINE CANAL DURING OCTOBER

LESS than one-fourth of the wheat came through the Lachine Canal during the month, which ended recently, than came through in October, 1915. The 1,399,038 bushels of wheat which came in lake boats and barges during October seems a small amount as compared with the 5,635,688 bushels taken through the canal in the same month last year. The only other decreases among the grains were in corn and flaxseed, neither of which came down at all, while last year in October the total was 68,081 bushels of corn and 41,602 bushels of flaxseed. Oats and barley, however, show the following splendid increases as between October in 1915 and 1916 respectively: Oats; 475,759 bushels and 1,238,902 bushels, increase 763,143 bushels, and barley, 211,115 and 474,018, increase 262,903 bushels. The total of all grains brought down the canal is half the amount carried last year for October, as follows: October, 1915, 6,432,245 bushels; October, 1916, 3,111,958 bushels; decrease, 3,320,287 bushels.

### Less Produce Carried

The total grain brought down during the season up to October 31, amounted to 22,405,114 bushels, being 13,280,174 bushels less than the amount brought down during the same period last year. Just as during other months of this season, there is almost as great an advance in the amount of coal brought down as there is a decrease in the amount of grain. The number of tons carried last month was 224,646, as against 128,779 for October, 1915.

Eggs, cheese, butter and apples have been carried in much smaller quantity, decrease in apples and butter being nothing short of astonishing. As for flour, none was carried at all, as compared with 49,800 sacks a year ago. The comparative statistics for the Octobers of 1915 and 1916 respectively are as follows: Cases of eggs, 341 and 256; packages of butter, 317 and 123; boxes of cheese, 31,423 and 29,065, and barrels of apples, 14,067 and 2,650, a decrease of 11,417 barrels.

During the month there were fewer trips, less tonnage operated, fewer passengers carried, and less cargo tonnage than in October, 1915. The statistics for the two months follow: Number of trips, 1,123 and 977; tonnage operated, 573,729 and 500,204; passengers carried, 757 and 697; cargo tonnage, 487,905 and 431,902; and number of trips light, 455 and 391.

### TRADE OF NEWFOUNDLAND

THE imports into Newfoundland in 1915 were valued at \$12,350,786, representing a decrease of \$2,842,940, compared with the imports of 1914. This decrease was shared in by practically every country exporting goods to Newfoundland. The imports from the United States decreased from \$5,796,906 to \$4,943,752; from Canada from \$4,861,047 to \$4,509,827; from the United Kingdom from \$3,826,529 to \$2,311,945; from British West Indies from \$222,801 to \$214,202; from Spain from \$113,541 to \$83,215, and from Germany from \$59,345 to \$10,343.

The decrease in the imports into Newfoundland of \$2,842,940, from 1914 to 1915, but principally due to the decreased importations of the following articles: Beef, salted in barrels, \$652,642 to \$465,940; boots and shoes, \$216,571 to \$132,188; blankets, quilts, carpeting, etc., \$478,977 to \$268,078; clothing, \$337,204 to \$207,296; coal, \$1,005,762 to \$719,189; cotton fabrics, \$331,131 to \$231,206; groceries, \$230,601 to \$168,966; hardware, \$370,135 to \$212,124; hemp and coir yarn, \$250,959 to \$149,057; machinery, \$769,737 to \$414,811; medicines, \$187,412 to \$87,837; oxen, cows and horses, \$166,570 to \$95,468; paints, \$147,479 to \$92,314; pork, \$822,191 to \$642,

911; railway materials, \$287,368 to \$137,297; and tweeds, cloths, doeskins, etc., \$187,444 to \$85,913. Articles for the army and navy, and flour were the only items to show substantial gains, these increasing from \$15,478 to \$219,555, and flour from \$1,823,551 to \$2,168,573.

### CONSERVATION OF PULP WOOD

THE disappearance of the wood pulp supply in Canada during the next twenty-five years, if conservation measures were not adopted, was prophesied at a recent session of the Dominions Royal Commission by Ellwood Wilson, an expert on the paper industry. Three things were essential to the protection of the pulp industry—the adoption of a scientific scheme of reforestation, a proper system of fire protection, such as has been adopted in British Columbia, and also a system that would do away with the dangerous disposal of waste that now prevails in the forests. During the past thirty-five years thirty per cent. of the pulp wood lands of Canada had been burned over and rendered useless for generations to come.

Carl Riordon explained how the long haul to Europe with its consequent high freight rates made it almost impossible for Canadian paper or pulp manufacturers to compete with the manufacturers of pulp in Europe, who are located principally in Sweden and Norway. When the war was over it was expected, with the higher taxes that would prevail in Europe, the higher cost of production and the higher cost of capital, that the price of the European pulp would increase materially, giving the Canadian a new field.

### INCREASED VALUE OF CANADIAN FISHERIES

CANADA possesses the most extensive fisheries in the world, and the waters in and around Canada contain the principal commercial food fishes in greater abundance than the waters of any other part of the world. Apart from salmon, all the lobsters, herring, mackerel and sardines, nearly all the haddock, and many of the cod, hake and pollock landed in Canada are taken from within our territorial waters. There is a coast line of 5,000 miles on the Atlantic side, 7,000 miles on the Pacific, and 220,000 square miles of fresh water, stocked with many species of excellent food fishes.

During the fiscal year ended March 31, 1916, the total marketed value of all kinds of fish, fish products and marine animals taken by Canadian fishermen was \$35,860,000, being an increase of \$4,596,000 over the 1915 figures. British Columbia was responsible for \$3,023,000 of the year's increase. Salmon was the chief product, representing a value of \$11,262,000; lobster came next with \$4,

506,000; cod, \$4,489,000; herring, \$2,906,000; halibut, \$2,261,000; haddock, \$1,232,000; sardines, \$1,229,000; whitefish, \$1,048,000. Oysters had a value of \$147,628.

The production by provinces, according to the Government records, is as follows:—

Province.	Value Produced.	Increase.
British Columbia .....	\$14,538,320	\$3,023,234
Nova Scotia .....	9,196,851	1,436,000
New Brunswick .....	4,737,145	*202,998
Ontario .....	3,341,182	585,891
Quebec .....	2,076,851	152,421
Prince Edward Island .....	933,682	*327,984
Manitoba .....	742,925	*106,497
Saskatchewan .....	165,888	33,871
Alberta .....	94,134	7,414
Yukon .....	63,730	*5,952
Totals .....	\$35,860,708	\$4,596,077
*Decrease.		

### TRADE INQUIRIES

THE following inquiries relating to Canadian trade have been received by the Department of Trade and Commerce, Ottawa.

1173. Representation.—A civil engineer who has had wide experience in the construction of municipal water-works, gas works and sewers in Canada, the United Kingdom and South Africa would like to make arrangements with a Canadian manufacturing concern to represent them as a commercial traveler in England, France, Belgium, Serbia, Russia or elsewhere.

1284. Machinery—Ore-Crushing.—A Johannesburg firm makes inquiry for machinery suitable for crushing and fibreizing asbestos. Sample of their worst raw fibre is on file with the Department at Ottawa.

1220. Cobalt and Nickel Ores.—A London manufacturing company asks to be placed in direct touch with Canadian producers of both cobalt and nickel ores.

1224. Representative.—An engineer who has held very important positions in charge of municipal construction work, such as water-works, gas-works, sewers, street improvements, etc., in the United Kingdom, South Africa and Canada, desires to act as a representative of a Canadian manufacturing firm or a combination of Canadian manufacturers during the reconstruction period after the war.

1231. Iron Wire, Galvanized Barbed Wire, Wire Nails, etc.—A Leeds firm is open to buy carload lots of galvanized barbed wire, galvanized fencing strand wire, and wire nails and are also interested in galvanized staples and iron wire.

1429. Engineering Supplies.—An Orange Free State firm of engineering specialists in refrigerator plants and pumping machinery requests catalogues and all other particulars in above lines and valves, joistings, boring drills, pumps, cylinders, pulleys and piping.

# INDUSTRIAL <sup>A</sup><sub>D</sub> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**New Glasgow, N.S.**—The Eastern Car Co., are installing a drop forging plant and an electric furnace.

**Hawkesbury, Ont.**—The Riordon Paper Co., propose extending their boiler and pumping plant here.

**Regina, Sask.**—Fire on Oct. 29, destroyed the electric light plant at Grand Coulee, a few miles west of here.

**Niagara Falls, Ont.**—The Canadian Aloxite Co., have commenced the erection of an addition to their plant to cost about \$30,000.

**St. John's, Que.**—Fire recently damaged the St. John's Machine & Tool Co. plant, the loss being about \$12,000, only partly covered by insurance.

**Port Arthur, Ont.**—The Fegles-Bellows Co., who propose to erect a factory near the site of the Conley Frog and Switch plant, request the immediate construction of a bridge over the McIntyre river at that point. They are going ahead with their construction earlier than was intended.

**Port Colborne, Ont.**—The International Nickel Co., has completed the surveys for its refinery at Port Colborne, and is now beginning excavation work in order to have the foundation completed before frost sets in. The company has set aside five million dollars for this plant. The Foundation Co., Montreal have the contract for the foundation.

**Halifax, N.S.**—H. R. Mallison of the Halifax Electric Tramway Co., announced recently that the company proposed spending \$1,500,000 on the extension and improvement of gas mains, electric power facilities and tramway extensions. The hydro-electric development in the Gaspereaux will probably be proceeded with soon. The gas plant will have a capacity twice greater than the present one. Upon the extension of the plant and mains one hundred thousand dollars will be spent.

**Renfrew, Ont.**—Power development works have been commenced by M. J. O'Brien of Renfrew at Calabogie village, situated at the foot of Lake Calabogie, an expansion of the Madawaska River. It is the intention to build dams and erect a power-house for the gener-

ations of 5,000 h.p. which will be transmitted either partly or wholly to Renfrew, a distance of twenty miles. A dam twenty-eight feet in height will be built on the site of an old mill of the pioneers, and beside it will be the power-house. The total cost of the whole development will approximate half a million dollars.

## Municipal

**Calgary, Alta.**—It is proposed to submit a by-law to the ratepayers to authorize the installation of a water filtration plant.

**Port Colborne, Ont.**—A by-law has been passed here granting fixed assessment for a number of years to the International Nickel Co. for its refining plant.

## General Industrial

**Fort William, Ont.**—The Barnet & McQueen Co., are the contractors for the extension to the Ogilvie Milling Co. elevation here.

**Valleyfield, Que.**—The Gold Lion Brewery was practically destroyed by fire on Oct. 31. The blaze is supposed to have originated in the engine-rooms. The damage is estimated at about \$150,000.

## New Incorporations

**The New Westminster Foundry Co.**, of New Westminster, B. C. has been incorporated with a capital of \$10,000.

**The Universal Smokeless Heat Generator Co.** of Victoria, B. C. has been incorporated with a capital of \$50,000.

**Foundry Products, Ltd.**, has been incorporated at Ottawa, with a capital of \$500,000, to carry on business as iron foundries and steel makers, etc., at Calgary, Alta. The incorporators are: Daniel L. Redman, Charles W. Coole, and Peter D. McAlpine, all of Calgary, Alta.

**Dominion Fire Brick & Clay Products, Ltd.**, has been incorporated at Ottawa, with a capital of \$500,000, to manufacture fire brick and clay products of all kinds at Moose Jaw, Sask. The incor-

porators are: H. G. Love, A. Hitchcock and Edward C. Mathews, all of Moose Jaw.

**The Shell Bar Grate Co.** has been incorporated at Toronto, with a capital of \$40,000, to manufacture a patent boiler grate and to carry on business as iron foundries and mechanical engineers at Toronto. The incorporators are: J. Max Bullen, Harold L. Steele and Wendell Osborne, all of Toronto.

**The Sterling Engine Works, Ltd.**, has been incorporated at Ottawa, with a capital of \$25,000, to manufacture steam and gasoline engines, and boilers, etc., at Winnipeg, Man. The incorporators are: Vincent C. Maddock, William J. Leaney and Garnet Coulter, all of Winnipeg.

**The Dominion Crucible Co.** has been incorporated at Ottawa, with a capital of \$200,000, to manufacture crucibles, graphite, clay and refractory materials, with head office in Montreal. Incorporators are: F. G. Bush, G. R. Drennan, and H. W. Jackson, all of Montreal.

**The Kingston Smelting Co.** has been incorporated at Toronto, with a capital of \$30,000, to carry on the business of mining and smelting ores at Kingston, Ont. The incorporators are: Alexander McKinnon, J. L. Whiting and David Murray, all of Kingston, Ont.

## Contracts Awarded

**Oshawa, Ont.**—The Toms Contracting Co., Toronto, has been awarded contracts for additions to the plant of the Chevrolet Motor Co., Oshawa.

**Toronto, Ont.**—A contract has been awarded by the Board of Control to Drummond, McCall & Co., Toronto, for six valves.

**Assiniboia, Sask.**—The Town Council have let the following contracts for the construction of a waterworks system: One internal combustion engine, Boving Co. of Canada, Ltd., Lindsay, Ont.; generator, switchboard, and other apparatus, Canadian Westinghouse Co.; pumps, motors, piping, and air compressor, James Ballantyne & Co.; one pneumatic storage tank, Canadian Allis-Chalmers, Ltd.; poles, wire, and line material, Northern Electric Co.; about 17,500 feet of cast iron or steel pipe and specials, Canada Iron Foundries; hydrants, gate valves, and boxes, T. McAvity & Sons.

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

<b>BRAZIL</b> Bahia, British Consul. Rio de Janeiro, British Consul General. <b>CHILE</b> Valparaiso, British Consul General. <b>COLOMBIA</b> Bagota, British Consul General. <b>ECUADOR</b> Quito, British Consul General. Guayaquil, British Consul. <b>EGYPT</b> Alexandria, British Consul General. <b>FRANCE</b> Havre, British Consul General. Marseilles, British Consul General. <b>INDIA</b> Calcutta, Director General of Commercial Intelligence.	<b>ITALY</b> Genoa, British Consul General. Milan, British Consul. <b>MEXICO</b> Mexico, British Consul General. <b>NETHERLANDS</b> Amsterdam, British Consul. <b>PANAMA</b> Colon, British Consul. Panama, British Vice-Consul. <b>PERU</b> Lima, British Vice-Consul. <b>PORTUGAL</b> Lisbon, British Consul.	<b>RUSSIA</b> Moscow, British Consul General. Petrograd, British Consul. Vladivostok, British Consul. Odessa, British Consul General. <b>SPAIN</b> Barcelona, British Consul General. Madrid, British Consul. <b>SWEDEN</b> Stockholm, British Consul. <b>SWITZERLAND</b> Geneva, British Consul. <b>URUGUAY</b> Monte Video, British Vice-Consul. <b>VENEZUELA</b> Caracas, British Vice-Consul.
--	--	--

## CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

### CANADIAN TRADE COMMISSIONERS.

<b>ARGENTINE REPUBLIC</b> H. R. Poussette, Reconquista, No. 46, Buenos Aires. Cable address, Canadian. <b>AUSTRALIA</b> J. H. Ross, Stock Exchange Building, Melbourne. Cable address, Canadian. <b>BRITISH WEST INDIES</b> E. H. S. Flood, Bridgetown, Barbadoes, agent also for the Bermudas and British Guiana. Cable address, Canadian. <b>CHINA</b> J. W. Ross, 13 Nanking Road, Shanghai. Cable address, Canadian. <b>CUBA</b> Acting Trade Commissioner, Lonja del Comercio, Apartado 1290, Havana. Cable address, Cantracom. <b>FRANCE</b> Phillipe Roy, Commissioner General, 17 and 19 Boulevard des Capucines, Paris. Cable address, Stadacona. <b>JAPAN</b> G. B. Johnson, P. O. Box 109, Yokohama. Cable address, Canadian. <b>HOLLAND</b> Acting Trade Commissioner, Zuidblaak, 26, Rotterdam. Cable address, Waterrill. <b>RUSSIA</b> C. F. Just, Canadian Government Commercial Agent, Alexandrivskaya, Ploshch 9, Petrograd. L. D. Wilgress, Canadian Government Commercial Agent, Bukhgozla Ulitza No. 4, Omsk, Siberia.	<b>NEWFOUNDLAND</b> W. ## Tenders

**Weir, Que.**—Tenders for furnishing all labor and materials and constructing a steel bridge and appurtenances to be erected over the Rouge River (Rivington Bridge), addressed to the undersigned, will be received by the Municipal Council of Harrington until December 2, 1916. All tenders shall be in accordance with the plans and the specifications prepared by the engineer of the Department of Public Works and Labor, and which may be seen at the office of the undersigned, Pierre Cantin, treasurer, P.O. Box 44, Weir, Que.

**Ottawa, Ont.**—Tenders, addressed to J. W. Pugsley, secretary of the Department of Railways and Canals, Ottawa, Ont., will be received up to November 15 for the construction of a reinforced concrete elevator with a capacity of 500,000 bushels. Plans, specifications and blank form of contract may be seen at the office of the following:—Chief engineer, Department of Railways and Canals, Ottawa; railways, Moncton, N.B., general superintendent, Winnipeg, Man.; resident engineer, Fort William, Ont.; John S. Metcalfe Co., engineers, Montreal, Que. Contractors who wish to obtain plans and specifications temporarily for their own use may obtain same on depositing a certified bank cheque for \$100.

## Marine

**St. Catherines, Ont.**—A serious accident occurred on the Welland Canal on Nov. 5 when the steamer J. H. Shrigley of Sarnia carried away both foot gates of lock 7, flooding the country in the vicinity.

**New Glasgow, N. S.**—The Nova Scotia Steel and Coal Co. have decided to enlarge their shipbuilding activities by building a second ocean going vessel, and one about 25 per cent. larger than that now under construction.

**Kingston, Ont.**—The steamer John F. Thom, belonging to the Thom Transportation Co. of Quebec, which recently went aground on the westerly end of Corrigan's Island, near Waddington, will be left in its present position until Spring.

**Brantford, Ont.**—With a view to the improvement of the Port Dover harbor Government officials paid a visit there on Saturday and gathered data to prepare plans for its deepening. Chief Engineer Stephen, of the Windsor office of the Department of Public Works; Martin N. Todd, general manager of the Lake Erie and Northern Railway, accompanied by Senator McCall, of Simcoe, comprised the party.

**Victoria, B.C.**—The first and most important section of Victoria's greater harbor scheme is now practically complete. The huge breakwater, which is constructed of granite and reinforced concrete 2,500 feet to seaward, has reached such a stage that within four weeks the contracting firm, Sir John Jackson, Ltd., will have completed the undertaking. The contract has been under way for the past three and a half years, initial operations being started in April, 1913, and continuous progress has been maintained. When the entire scheme is completed, Victoria will have one of the finest harbors, equipped with the finest facilities for handling large ships on the entire coast. Rapid progress is being made by the firm of Grant Smith & McDonnell in the construction of the two concrete piers sheltered by the breakwater. The whole of the fifty-two reinforced concrete caissons required for the contract have been completed and, with the exception of one, all have been sunk in position on the site. At low water the outline of the piers can be clearly distinguished.

## Railways—Bridges

**Russian Railroad Construction.**—Foley, Welsh & Stewart, Canadian railroad builders, have their men at work on the contract for 3,000 miles of railroad in European Russia which they recently secured. Preliminary surveys are being made, and it is thought that by spring the actual construction will have begun.

**Railroad Contracts Pending.**—Railroad construction contracts, totalling 28,000 miles in Russia and China, are pending, and even that amount is said to represent only a small part of the future development in this respect. A conservative estimate places the railroad construction in Asiatic China and Russia at from 60,000 to 70,000 miles in the next decade.

## Personal

**W. M. Neal** has been appointed acting superintendent C.P.R. car service, vice H. J. Humphreys, transferred.

**Lionel L. Gisborne**, formerly assistant waterworks engineer at Ottawa, has been appointed manager of the Toronto office of the General Supply Co., of Canada. The office is located at 38 Toronto Street.

**E. R. Wood**, Toronto, has complete charge of the institution of the Canadian Aviation school being established in Toronto by the Imperial Munitions Board. **Lord Innes-Ker** represents the British Government.

**H. P. Hoag**, superintendent of Goold, Shapely & Muir Co., Brantford, Ont., has resigned to go to a munition factory in Toronto. He was given a chest of silver by the employees as a token of regard.

**Senator Wilson**, of Montreal, and **C. S. Wilcox** and **Paul J. Myler**, of Hamilton, have been elected to the board of North American Pulp & Paper Co. This concern controls three pulp and paper mills in Canada and the United States, and has extensive limits in Canada.

**E. P. Mathewson** has been appointed to the position of general manager of the British American Nickel Corporation's plant at Sudbury, Ont., Mr. Mathewson was formerly manager of the reduction works of the Anaconda Copper Co.

**William T. Banfield** has finished his engagement as production manager with the International Arms & Fuse Co., Bloomfield, N.J., and has returned to Toronto to resume his former duties as a member of the firm of Banfield & Sons, engineers.

**J. S. Dennis**, assistant to the president of the C.P.R., who for many years, has been in Calgary as head of the company's Department of Natural Resources, has been transferred to Montreal. Mr. Dennis, it is understood, will retain his connection with the Department of Natural Resources in an advisory capacity, but the administration of the department will be turned over to **P. L. Naismith**, who has been manager for some years. Mr. Dennis comes to Montreal as assistant to Lord Shaughnessy, to take up special duties, among which are the important questions of colonization and the development of the resources of the Dominion adjacent to the company's system.

## Trade Gossip

**The Reliance Mfg. Co.** has increased its capital stock to \$500,000.

**Montreal, Que.**—Vickers, Ltd., have an order for two 7,000-ton steamers for Norwegian owners.

**The National Iron Works Ltd.**, Toronto have been awarded a contract by the Toronto Board of Control for cast iron pipe.

**Heavy Ore Shipments.**—An increase of more than 11,000,000 tons to shipments of iron ore from Duluth, Minn., is shown in reports for the season ended Nov. 1, as compared with the records of the corresponding period last year. Up to Nov. 1, 1915, shipments amounted to

Finish Bore, Inside Radius.

## 50% Boring Economy!

High-salaried men are employed to keep the cost of production down, but in this case a boy could see the advantages to be obtained through these boring heads.

25% to 50% reduction is obtained only by the use of Davis Boring Heads. These consist of 16 sizes and 26 different styles, and embrace every operation from a shell of the smallest calibre to 8" and 9.2". (The quality of work produced is limited, and that limit is highest quality.)

Davis Boring Heads are constructed of high-speed steel and are the result of years of scientific knowledge of boring-tool requirements and the experience obtained by the "pioneering" days.

WRITE FOR PARTICULARS.

The heads illustrated here are used for operations on 8" and 9.2" shells. The heads are all equipped with micrometer adjustments. This enables more speed to be put to the operation, leaving the adjusting of the cutters to the micrometer.

**W. H. BANFIELD & SONS**

372 Pape Avenue, Toronto, Can.

29,345,174 tons, while during the 1916 season 40,608,767 tons have gone forward.

Canadian Allis-Chalmers Ltd., Toronto, have been awarded a contract for pumping equipment for the town of St. Marys, Ont.

The Lyman Tube & Supply Co., 33 Melinda Street, Toronto have appointed H. E. Breuls their city salesman. Mr. Breuls is specializing on chain drives.

Charles C. Kawin Co., chemists and metallurgists, have extended their office and laboratory accommodation in the Kent Building, Toronto, in order to take care of increasing business.

The John Bertram & Sons Co., Dundas, Ont., will open a sales office in the C.P.R. Bldg., Toronto about Dec. 1. They will carry in stock a full line of Pratt & Whitney small tools. John Ferguson of their headquarters staff will be in charge.

The Lyman Tube and Supply Co., 323 St. James St., Montreal have opened a New York office for the purpose of purchasing machinery and other equipment for the benefit of their customers and so that material can be shipped from stock. K. E. Gury, formerly with the Driggs Ordinance Co. will be in charge of the New York office, located at 2606 Equitable Bldg.

The Normac Machine Co., St. Catharines, Ont., have equipped a factory for the manufacture of taps, dies, jigs, gauges, fixtures and all kinds of tools. The members of the new firm are J. H. McCoy and S. A. Norton. Both are men of long experience, Mr. McCoy being formerly connected with the National Cash Register Co. and Mr. Norton with the Whitman & Barnes Co.

Kingston, Ont.—The repair work on the North American smelter, which was recently taken over by the Kingston Smelting Co., is being rushed to completion, and it is expected that the plant will be in operation in three or four weeks. The capacity of the smelter will be about twenty tons a day. The company has not found it necessary to install any new machinery, the old equipment being thoroughly adequate for the work required of it when put into a state of repair. The company intend to smelt lead concentrates into lead, for which there is a splendid market in Canada.

Britain's Output of Munitions.—H. E. Morgan, one of the directors of the Labor Supply Department of the Imperial Ministry of Munitions, is at present in Ottawa, giving to the Imperial Munitions Board, the benefit of his knowledge and experience of labor problems in the munition factories of Great Britain. He says that the output which

\$5 a ton for steel billets, which are now held at \$50 a ton, Pittsburg. The present outlook may portend still higher in 1914-15 took twelve whole months to produce can now be obtained from British sources in from four days to three weeks, depending upon the class of product. The total number of war workers in 1914 was under 200,000, to-day it is 2,500,000.

**Power Hack Saws and Grinder.**—The Perfect Machine Co., Galt, Ont., have issued a catalogue dealing with an interesting line of power hack saws, grinders, lathes and drills. The various types of machine are illustrated accompanied by a specification of each and their principal constructional features.

**Pulp Wood May Be Scarce.**—The disappearance of pulp wood in Canada during the next twenty-five years, if conservation measures are not adopted, was prophesied before the Dominions' Royal Commission at its session in Montreal on Oct. 31, by Ellwood Wilson, an expert on the paper industry. Mr. Wilson stated that there were three things indispensable to the progress on the pulp industry in this country; one was the adoption of a scientific scheme of reforestation; another a proper fire protection system such as they have in British Columbia, and also a system of avoiding wastage.

**Serious Coal Shortage.**—According to a statement issued on Nov. 1, at Wilkesbarre, Pa., by the Anthracite Bureau of information, which is maintained by mining companies in the hard coal fields, the production of anthracite from April 1 to September 30, this year, was 2,075,000 tons less than in the corresponding months of 1915. This decrease, the statement says, has been due almost entirely to the shortage in the labor supply. During this period there has been no time when there was a surplus of coal on the market. Officials of the Mine Workers' Union are blamed New York office for the purpose of purports for anthracite.

**Twist Drill Manufacture.**—I am convinced, says Seymour Bingham, in the "Ironmonger," that Britain will never rise to the occasion to make jobbers' drills to compete with the Germans; firstly, because the trade unions will prevent British makers employing female labor; and, secondly, because failing this, male labor will make the drills too dear to compete. I am so convinced of this that I am putting down a drill works here (Italy), where I can secure cheap female labor and cheap hydro-electric power, and where taxes (compared with Great Britain) are low. In addition, the Italian Government will allow entry of all my plant duty free in order to encourage new industries.

In Light and Air and sanitary Working Con-  
ditions.  
In clean, fresh drinking water for everybody.  
In the Safety, Economy and Man-betterment.*

### **PURO** SANITARY DRINKING FOUNTAIN (MADE IN CANADA)

The loss of a man through impure drinking water is a crime that "the front office" must bear.

An ugly statement, isn't it? But true, absolutely.

When a man comes to work in your factory he puts his health in your keeping. Are you willing to take chances on such a trust?

Impure drinking conditions are responsible for more tragedies than any machine ever built.

Apply the "Safety First" Principles to your water supply; don't deny your men a clean, fresh drink of water.

Conserve their health and they will improve your profits; make yourself as worthy of the name of "employer."

Install the Gold Medal winner Puro in your plant, office and shop alike.

The only Sanitary Drinking Fountain that is safe, sanitary, simple, automatic in control and easily attached.

Let us tell you just what it will cost you to

**STEEL OF EVERY  
DESCRIPTION.**

### Hawkrige Brothers Company

303 Congress St., BOSTON, MASS.  
U. S. A.

**Ironworks in Norway.**—In Norway a scheme is being elaborated for the erection of an ironworks with a minimum annual output of 50,000 tons. It is to be built in the vicinity of water-power works and within 300 kilometres of Narvik, the Norwegian port of shipment of Lapland iron ore. It is intended to install a coke plant which is to be supplied with foreign coal, as well as a by-products recovery plant and steel works, with foundry and rolling mills. The coal (about 125,000 tons a year) is to be obtained from England. The capital will be about \$4,250,000.

**Orders for Rails Are Unfilled.**—Despite the fact that the Dominion Government has permitted the Canadian railways to import rails free of all duty except the war tax the imports of rails have been so far very small. The Government's action was taken as a means of relieving what was represented as a serious shortage of steel, due to the fact that Canadian mills were so largely enlarged in the manufacture of war munitions. The railways wanted rails in order to move the crop, especially from some of the more recently settled districts, and the Government authorized the importation of rails without the payment of the regular duty. The railways placed large orders in the United States, but these orders have for the most part remained unfilled. One company which had on hand a quantity of second-hand rails, released them for a military purpose, and has been unable to replace them.

**Will Make Paper from Wood Chips.**—Advices from Washington, D.C., state that as the result of studies which have been made at the Forest Products Laboratory on methods of handling wood chips suitable for paper pulp, it is announced that Wisconsin paper companies are now negotiating with the railroads for shipment to their factories of experimental trainloads of chips of Western woods adapted to paper making. Previous investigations by the Forest Service have demonstrated that good grades of paper can be made from a number of Western woods. The experts now estimate that some of these woods, when cut into chips and dried and baled, can be delivered to the mills in Wisconsin at a very small advance over the cost of chips made from local timber. In Wisconsin alone, it is stated, there is an annual market for over 300,000 cords of pulpwood.

**Steel at New High Record.**—Prices of steel in the United States, eight leading steel products being used for the purpose, averaged a new record high level last week. The estimate is \$63.75 a gross ton, which compares with \$63 a week ago and with \$63.42 a fortnight ago. The increase in the average was brought about mainly by the advance of

## There's the Farmer

**P**ROSPEROUS and thrifty, yet withal a spender. A motor car, if he feels like it. A good barn, a disposition towards pedigreed stock, good implements, and a buyer of man-saving machines.

Then there's his family—all with ready money all the year round, thanks to better marketing methods and facilities.

This farmer and his family read farm papers—pay good money for such a paper—because they want its help, direction and information.

And they most certainly read the advertisements with deep attention in

### The FARMER'S MAGAZINE

Half of Canada's population is rural, and farmers have a greater purchasing capacity than the average town or city family. Go after the farmer's trade through his own medium.

*N.B.—Objectionable advertising not accepted. Both editorial and advertising columns are closely censored to keep them clean and decent.*

## "Mecol" Furnaces

Designed and Built in Canada  
for all  
industrial  
purposes

### What the use of Oil instead of Coal-fired Furnaces means to you—

- A Clean Workshop without Smoke or Soot.
- Only half the furnace space necessary.
- Less than half first cost of furnaces.
- No chimneys or flues required.
- Instantaneous and perfect control of temperature.
- Higher temperatures obtained.
- No heaters, coal or ash handlers required.
- No coal or ash piles.
- Less waste of fuel and less time required to bring furnaces up to working heat.
- No waste of fuel after work is done, as supply is shut off instantly.

Write for full particulars.

Kindly mention this paper when writing advertisers.

prices, and perhaps 1917 contracts from abroad will be met with \$15 a ton more than was paid a few months ago. For instance, the Carbon Steel Co. of Pittsburgh has received at rising prices an order from Italy for \$3,000,000 in rounds and another order from the United States Government for \$1,000,000 of deck plates for one of the battleships now building.

## Catalogues

**Engineers' Vice**—A leaflet illustrating and describing the "Greyhound" engineers' vice and a combined lathe, planing, shaping and fluting machine, made by Joseph Appleyard, Bradford, Yorks, England.

**Turret Lathes.**—The International Machine Tool Co., Indianapolis, Ind., have issued a bulletin illustrating and describing the "Libby" heavy duty lathe designed for use in railroad shops. The illustrations include several sketches showing typical samples of work done on this lathe and the time taken for the operation. The bulletin also contains a table giving a record of work done on the "Libby" lathe, being a copy of a railroad monthly cost sheet.

**The Schoop Process Bulletin** describing the "Schoop" metal spraying process, issued by the Metals Coating Company of Canada Ltd., Montreal. The bulletin first deals with the problem of corrosion, and the development and application of the "Schoop" process. Then follows matter relating to the construction of the spraying pistol, its mechanical details and method of operation all being described fully and accompanied by illustrations. The concluding pages illustrate and describe the "Gravitas" apparatus, devised for spraying zinc. A data sheet is included with the bulletin giving a detail cost of using the pistol with various metals.

**Thos. W. Ward Ltd.**, Sheffield, England, have mailed us a copy of their "Albion" machinery catalogue which is issued monthly and contains a list of machinery in stock. The catalogue is arranged in two sections, the first section contains list of new and second hand machinery including machine tools of all kinds, electrical apparatus, steam, gas and oil engines, pumps, etc. The second section is devoted more particularly to second-hand boilers, tanks, tubing and rails, etc. Reference is made in the catalogue to other departments of the firm's business including scrap metals of all kinds, pig iron etc. It is stated that these materials are dealt with in large quantities and are purchased in a large number of markets.

# Principles and Apparatus Employed in Testing Limit Gauges

By R. T. Glazebrook, C.B., F.R.S. \*\*

*Perhaps no finer evidence of the value of the National Physical Laboratory in England can be offered than the work of which this paper is at best an outline only. The enormous number of gauges required for munitions production was only possible as a result of training given to numerous skilled toolmakers at this institution. The value of properly made gauges will be still more appreciated in the future and increased demands on the Laboratory resources for testing precision apparatus by engineering firms are confidently predicted.*

THE fundamental idea of limit gauging—that the dimensions of a piece of work should lie between certain definite values, and that the engineer should possess some means of measurement which would enable him readily to tell if this was the case—is probably quite old. Its importance, owing to the growth of repetition work and the demand for interchangeability, has increased greatly of late; during the past two years the growth has been enormous.

## Engineering Standards Committee Work

The work of the Engineering Standards Committee in this, as in many other branches of engineering industry, has been of the utmost value, and it is to the reports of that committee we turn for much of the information on the subject. It is impossible to speak on this subject without reference to the two men whom we have recently lost whose labours did so much to promote the cause of standardisation. Sir H. F. Donaldson was chairman of the Committee on Gauges from its commencement. He threw himself into the work with all the energy of which he was capable; his tact and experience steered the committee over many shoals, his knowledge was of the greatest value, and his fairness and courtesy endeared him to all his colleagues. In all he did he was most ably supported by Mr. Leslie Robertson. Only the men who have been intimately acquainted with Mr. Robertson's work for the Standards Committee can realize the greatness of his loss and the difficulty of finding one to fill his place.

Report No. 27, dated June 1906, deals with British Standard Systems for Limit Gauges (Running Fits), and was the result of much careful inquiry and discussion. From it is taken the following definition:—

“Limit Gauges.—Gauges for ensuring that any given dimension is within the tolerance laid down for the class of work to be produced. In the case of cylindrical work these gauges may be either double male gauges, one end of which must enter, and the other end of which must not enter the hole to which it is

applied, or they may be either two-ring or two-gap gauges, one of which must pass over, and one of which must not pass over the plug or male piece to which they are applied. The committee have in view three classes of limit gauges, viz.:—

“(a)—Standard Limit Gauges made in accordance with the recommendations contained in this report, and with the greatest possible accuracy, for depositing with the National Physical Laboratory, for purposes of reference.

“(b)—Reference Limit Gauges, being copies of the foregoing standard limit gauges for use by manufacturers and others for checking their own shop gauges. They should be verified, and their accuracy certified by the authority in whose custody the standard limit gauges are deposited.

“(c)—Shop Limit Gauges. — The gauges actually used in the shop and checked against the reference limit gauges.”

To this list it is desirable to add “Cheek Gauges,” i.e., gauges designed to check readily the dimensions of gauges in use either as reference gauges or as shop gauges. These are usually the inverse of the gauges they are employed to check, i.e., for a hole, the cheek gauge is a plug and vice versa.

I propose to say something about these various classes of gauges, their use, the permissible limits of accuracy, and the methods of measuring or otherwise determining their dimensions; but before proceeding to this three other terms in common use need definition. These are:—

Tolerance.—A difference in dimensions prescribed in order to tolerate unavoidable imperfections of workmanship.

Allowance.—A difference of dimensions prescribed in order to allow of various qualities of fit.

Clearance.—A difference in dimension or in the shape of the surface prescribed in order that two surfaces or parts of surfaces may be clear of one another.

In dealing with gauges we may subdivide them usefully into three groups:

- 1—Gauges for plain cylindrical work.
- 2—Screw gauges.
- 3—Form and position gauges.

## Introduction of Standardisation.

Years ago Sir Joseph Whitworth em-

barked on the standardisation of certain gauges for plain and screwed surfaces, and the use of Whitworth gauges has been of enormous value to engineering science, but these gauges are not, and had not at the time the committee began its work, been used as limit gauges in the true sense; consequently interchangeability was not secured. Sir Joseph aimed at standards which should be true dimensions, and he made no effort—at that time it did not appear necessary—to specify plus or minus limits for each class of work. Accordingly, at the outset the committee were faced with the necessity of inquiring what should be the limits on the work in order that interchangeability may be secured, and what gauges are required for this purpose.

## Cylindrical Work and Gauges

In dealing with the work it is clear that the tolerances and allowances must depend on its nature and the class of fit aimed at; different allowances are necessary for running fits, push fits, force fits, etc. In the year 1906 the data available to determine these were small. Accordingly, arrangements were made by which Mr. Attwell of the National Physical Laboratory visited the workshops of many of the leading manufacturers of the country, and, by their kindness, carried out the accurate measurement of plain cylindrical shafts and holes from 2 to 12 inches in diameter. The results are contained in the tables and plates of a long report (No. 25) dated July 1906. Certain firms—notably Messrs. Armstrong, Whitworth—had already adopted a system of limits for their own use, and information on these was also before the committee.

As a result, the committee were able to draw up a definite series of recommendations with regard to running fits, though before reaching a final decision another difficulty had to be faced. Are the dimensions of the shaft or of the hole to be made the basis of the work? With an inch shaft, for example, is the shaft to be made as nearly 1 inch as possible with only the necessary tolerance and the whole of the allowance, to secure the running fit to be made in the hole which is, therefore, of necessity larger than one inch by the amount of

\*Presented at the meeting of the British Association at Newcastle, September, 1916.

\*\*Head of the National Physical Laboratory, Teddington.

this allowance; or is the reverse course to be adopted? In the end the committee adopted the view that wherever possible the shaft should be the element more nearly approaching the true dimensions, and allowance be made on the whole according to the kind of fit required. The tolerances on the shaft are negative, so that it may never exceed its nominal dimensions. A minimum allowance, obtained by making the hole of larger than nominal size, is specified, and this cannot be encroached upon by either element; above this a positive tolerance is allowed on the hole. For example, in the case of a 5 in. shaft and hole of first-class work, the tolerance on the shaft is .002. Thus it must lie between 5.000 ins. and 4.998. The allowance is also .002, so that the minimum diameter of the hole is 5.002 ins. On this there is a tolerance of .002 again, hence the hole may have a maximum diameter of 5.004 ins.

### Shaft Gauges

This system the committee call the shaft basis; they note, however, that the system may be reversed, the hole being taken as basis, and the allowances applied to the shaft, the minimum diameter of the hole being its nominal size.

It will be noted that, with a view to reducing the number of gauges required, the scheme has been arranged so that the maximum diameter of the hole for first-class work is the minimum for second-class work, and so on. Assuming now agreement has been reached as to the allowances and tolerances on the work, what as to the gauges?

For a shaft we require two gauges — two rings or snap gauges as may be preferred — one corresponding to the maximum or high dimension, the other to the minimum or low dimension, and as perfect workmanship is impossible these gauges must be subject to tolerances; what is to be said as to the sign and amount of the tolerances? Here a distinction has to be noted. So long as the work is within the limits allowed, interchangeability is secured, and will pass inspection. In fairness, however, to the manufacturer, all work up to the limits should pass; the inspection gauges should not demand narrower limits than the production drawings. Accordingly the tolerances on a high inspection gauge must be positive, those on a low inspection gauge negative.

This is a point which the gauge maker should carefully attend to. He knows, may be, that the nominal size of a certain high gauge is 2.00 in. with a tolerance of 0.0005 in.; he should try then to make his gauge 2.00025 in. In many cases the attempt is made to produce the gauges as nearly as possible 2.000

in., and some are made a trifle too small; they are rejected necessarily; had their aim been to arrive at 2.00025 in., probably all would have got through when tested.

So far, then, we have found that for an inspection gauge the tolerance is positive on the high gauge, negative on the low, but in the workshop gauge, as will be seen, the reverse is the case. These are given out by the manufacturer to the workman to enable him to make work which will pass the inspector. Clearly then for safety he will arrange that the limits to which the man works are rather narrower than those to which the work will be inspected. A high gauge will be a trifle too small, a low gauge slightly too large; the tolerance on the high gauge is negative, that on the low gauge is positive,

As to the tolerances permissible, these depend on the class of work dealt with, and for inspection gauges amounts of the order of one-tenth of the tolerances on the work are not unusual. Thus, for the 5 in. shaft of first-class work already referred to, the high gauge would lie between 5.000 in. and 5.0002 in., the low gauge between 4.998 in. and 4.9978 in. These, of course, are close limits. For a workshop gauge the tolerances, as well as being of opposite sign, may wisely be large in amount; the result of this is to contract somewhat the limits within which the workman has to work, but to increase the chance that his work will pass. Moreover, the "Go" gauges wear, and a ring or a plug may easily in time become too large or too small respectively if when new they are very close to their nominal sizes.

In our original classification of gauges, reference gauges were mentioned. These clearly include both reference inspection gauges and reference shop gauges; they are retained for the purpose of standardizing the other gauges.

### Cylindrical Gauges Measurement and Testing

We turn now to the measurement and testing of cylindrical gauges. For the purpose of merely testing a gauge to see if it is correct, two check gauges—a "Go" and a "Not-go"—may be used, and in some cases must be used. The difference between these will be equal to the tolerance on the gauge they are used to check and their own tolerances will be much smaller, but for cylindrical gauges in most cases check gauges are not necessary, and indeed are not desirable; the difficulties arising from inaccuracy of manufacture and wear are too serious. Besides, rejection by a check gauge gives no intimation of the error to the manufacturer, and thus it is unsatis-

factory to him. Thus cylindrical plug gauges are preferably checked by some form of accurate micrometer or measuring machine. To describe such machines in detail would fill a paper by itself; it must suffice to mention one or two leading points.

### Cylindrical Plug Testing Machines

The original Whitworth form depends on the use of a feeler, a bar which is passed down between the jaw of the machine and the gauge under test, and while high accuracy can be attained by practice the results are slow and depend on the skill of the observer. In another form, the plunger presses against a spring, and tilts a delicate level. The micrometer is turned until the bubble is central, thus securing that the pressure applied to the gauge is always the same; the importance of this is very great. It has been found useful at the National Physical Laboratory to replace the level by a tilting mirror; the machine is in adjustment when a ray of light reflected from the mirror occupies a definite position of a suitably-placed scale.

There was submitted a photograph of a large machine, built to the laboratory design, by Messrs Armstrong, Whitworth, in which this device is used. It is employed to measure large cylindrical gauges, and was built for the measurement of the coils of some of the standard electrical apparatus.

Another photo submitted to the meeting was an instrument in regular use for testing smaller cylindrical gauges. A vertical plunger pressed downwards by a spring actuates a light lever moving over a scale; below is a horizontal platform with a slow vertical motion. A standard gauge of the required dimension is placed on the platform which is raised until the upper end of the gauge pressing on the plunger brings the lever to the centre of the scale; the standard then removed, and its place taken by the gauge under test. The difference between this and the standard is given by the position of the pointer on the scale. In another instrument of this class, the motion of a diaphragm raises or depresses a column of liquid in a fine tube.

All these methods demand the employment of accurate standards of a large variety of lengths. Such are afforded by the now well-known Johanssen gauges. By means of these, length gauges differing in length by one or more thousandths of an inch can be built up with an accuracy amply sufficient for checking gauges to under the one ten-thousandth, and most of the test work at the National Physical Laboratory is now done by the aid of these gauges.

To discuss the problem how the Johanssen gauges are checked would carry us too far into detailed considera-

tion of such work, while how to make them is a secret many would wish to share with Mr. Johanssen.

The checking of ring gauges or of snap gauges is a more difficult problem. For many purposes check gauges are used—a "Go" and a "Not-go" plug the external diameters of which can be accurately measured, and indeed for small rings this is the only method. For larger gauges there are various forms of internal calipers available but these do not lend themselves readily to high accuracy. A method which has been found convenient at the laboratory is to build up a "Go" and "Not-go" internal diameter gauge, by means of a series of Johanssen gauges with two plain cylinders of known diameter, one at each end of the series. When once such a diameter gauge has been put together, the checking of a series of rings of the same diameter becomes a simple matter.

### Screw Gauges

The problem of the standardization of screw limit gauges is a very difficult one; a screw surface is a complex form and to satisfy oneself that in all its dimensions it lies within certain limits involves much careful work. The following definitions are taken from the report of the Engineering Standards Committee on British Standard Systems for Limit Gauges for Screw Threads.

**Effective Diameter.**—The effective diameter of a screw having a single thread is the length of a line drawn through the axis and at right angles to it, measured between the points where the line cuts the slopes of the thread.

**Core Diameter.**—The core diameter is twice the minimum radius of a screw, measured at right angles to the axis.

**Full Diameter.**—The full diameter is twice the maximum radius of a screw, measured at right angles to the axis.

**Crest.**—The crest is the prominent part of the thread, whether of the male screw or of the female screw.

**Root.**—The root is the bottom of the groove of the thread whether of the male screw or of the female screw.

**Slope of Thread.**—The slope of thread is the straight part of the thread which connects the crests and roots.

**Angle of Thread.**—The angle of thread is the angle between the slopes, measured in the axial plane.

**Pitch.**—The pitch is the distance in inches measured along a line parallel to the axis of the screw between the point where it cuts any thread of the screw and the point at which it next meets the corresponding part of the same thread. The reciprocal of the pitch measures the number of turns per inch or millimetre, as the case may be. See Figs. 1 and 2.

In the Whitworth thread standardized by the committee there are seven elements, and error in any one of these may

be sufficient to cause a gauge to reject work which ought to pass, or vice versa. These elements are as defined already:—Full (or major) diameter; Core (or minor) diameter; Effective (or pitch) diameter; Pitch; Angle; Form at Crest; Form at Root. Of these, the most important and the most difficult to control are the pitch and the effective diameter.

In the Whitworth thread the attempt is made to obtain contact over the whole surface of the screw. While possibly for some purposes this is desirable, it

FIGS. 1 AND 2.

adds greatly to the difficulties of both construction and gauging, and there is much to be said for a system which allows definite clearances at crest and root. Four of the above seven elements—the two first and the two last—then become unimportant, and we are left to concentrate on the effective diameter, the pitch, and the angle of the thread. If the screw bears along its slopes it is doing its work satisfactorily, and in most cases the fact that there is clearance at crest and root is immaterial. Before proceeding further, it is important to notice that errors in pitch and effective diameter are closely connected.

Suppose the full and dotted outline, Fig. 3, to represent a ring and a plug screw of similar form, but of slightly different pitch. Let the maximum relative displacement of any two threads engaged be  $2a$ . Then the extreme threads will be displaced axially by  $+a$  and  $-a$  respectively. A glance at the diagram shows that in this case the parts will not go together unless the axial displacement is accompanied by a radial displacement which, allowing for the angle of the thread, is about equal to  $2a$ . This is doubled on the diameter, so that as a rough rule it may be taken that any error in pitch has to be compensated by an error of twice the amount in effective diameter.

FIG. 3.

Thus we can compensate for an error  $p$  in pitch on a thread of which  $t$  in. are engaged by allowing a reduction of effective diameter of  $2pt$  in the plug, or an increase of the same amount in the ring. Some reductions in the full and core diameters are also required, but in consequence of the curves at crest and root these are small and need only rarely be taken into consideration.

Reducing the effective diameter of a plug, or increasing that of a ring screw, has the effect of reducing the thickness of the corresponding thread at that point; the thread is made thin. Thus, in order to compensate pitch errors, makers have a tendency to make their screws thin; they claim an allowance on effective diameter which makes up for the error tolerated on pitch.

The Engineering Standards Committee, in their Report No. 38, stated that they have had two separate matters to decide upon:—

(1) To lay down tolerances on full, core, and effective diameters to cover the wear of tools and unavoidable imperfection of workmanship, and to prescribe minimum allowances in order that bolts and nuts may be assembled freely.

(2) To decide what errors in pitch could be permitted in ordinary practice, having regard to the allowances in effective diameter which they entail, and as a result they recommended a series of tolerances for the two threads considered—British Standard Whitworth and British Standard Fine.

The report also gives formulae for the tolerances on pitch and the allowances on effective diameter required to compensate them, and tables setting out the tolerances on the various elements.

Turning now to the question of providing limit gauges for such threads, we are met with many difficulties. The committee, after a discussion of these, summarized their recommendations thus:—

### For Bolts

- 1.—"Go" and "Not Go" gauge of the "Taylor" type for pitch and effective diameter.
- 2.—"Go" and "Not Go" double gap gauge for full diameter.
- 3.—"Go" and "Not Go" double gap gauge for core diameter.

### For Nuts

- 1.—"Go" Standard Bolt, correct in all particulars, and made to the minimum diameters allowable.
- 2.—"Not Go" single thread gauge for full diameter.
- 3.—"Not Go" single thread gauge for effective diameter.
- 4.—"Not Go" cylindrical gauge for core diameter.

### Taylor Three Point Gauge

We shall see shortly what is meant by the "Taylor" type of gauge. For bolts, the three "Go" gauges recommended may be, and usually are, replaced by single "Go" ring gauge, a ring screw of correct form and dimensions. Such a gauge is difficult to construct and verify with accuracy; hence Mr. Taylor suggested for pitch and effective diameter a three-point gauge.

this allowance; or is the reverse course to be adopted? In the end the committee adopted the view that wherever possible the shaft should be the element more nearly approaching the true dimensions, and allowance be made on the whole according to the kind of fit required. The tolerances on the shaft are negative, so that it may never exceed its nominal dimensions. A minimum allowance, obtained by making the hole of larger than nominal size, is specified, and this cannot be encroached upon by either element; above this a positive tolerance is allowed on the hole. For example, in the case of a 5 in. shaft and hole of first-class work, the tolerance on the shaft is .002. Thus it must lie between 5.000 ins. and 4.998. The allowance is also .002, so that the minimum diameter of the hole is 5.002 ins. On this there is a tolerance of .002 again, hence the hole may have a maximum diameter of 5.004 ins.

### Shaft Gauges

This system the committee call the shaft basis; they note, however, that the system may be reversed, the hole being taken as basis, and the allowances applied to the shaft, the minimum diameter of the hole being its nominal size.

It will be noted that, with a view to reducing the number of gauges required, the scheme has been arranged so that the maximum diameter of the hole for first-class work is the minimum for second-class work, and so on. Assuming now agreement has been reached as to the allowances and tolerances on the work, what as to the gauges?

For a shaft we require two gauges — two rings or snap gauges as may be preferred — one corresponding to the maximum or high dimension, the other to the minimum or low dimension, and as perfect workmanship is impossible these gauges must be subject to tolerances; what is to be said as to the sign and amount of the tolerances? Here a distinction has to be noted. So long as the work is within the limits allowed, interchangeability is secured, and will pass inspection. In fairness, however, to the manufacturer, all work up to the limits should pass; the inspection gauges should not demand narrower limits than the production drawings. Accordingly the tolerances on a high inspection gauge must be positive, those on a low inspection gauge negative.

This is a point which the gauge maker should carefully attend to. He knows, may be, that the nominal size of a certain high gauge is 2.00 in. with a tolerance of 0.0005 in.; he should try then to make his gauge 2.00025 in. In many cases the attempt is made to produce the gauges as nearly as possible 2.000

in., and some are made a trifle too small; they are rejected necessarily; had their aim been to arrive at 2.00025 in., probably all would have got through when tested.

So far, then, we have found that for an inspection gauge the tolerance is positive on the high gauge, negative on the low, but in the workshop gauge, as will be seen, the reverse is the case. These are given out by the manufacturer to the workman to enable him to make work which will pass the inspector. Clearly then for safety he will arrange that the limits to which the man works are rather narrower than those to which the work will be inspected. A high gauge will be a trifle too small, a low gauge slightly too large; the tolerance on the high gauge is negative, that on the low gauge is positive,

As to the tolerances permissible, these depend on the class of work dealt with, and for inspection gauges amounts of the order of one-tenth of the tolerances on the work are not unusual. Thus, for the 5 in. shaft of first-class work already referred to, the high gauge would lie between 5.000 in. and 5.0002 in., the low gauge between 4.998 in. and 4.9978 in. These, of course, are close limits. For a workshop gauge the tolerances, as well as being of opposite sign, may wisely be large in amount; the result of this is to contract somewhat the limits within which the workman has to work, but to increase the chance that his work will pass. Moreover, the "Go" gauges wear, and a ring or a plug may easily in time become too large or too small respectively if when new they are very close to their nominal sizes.

In our original classification of gauges, reference gauges were mentioned. These clearly include both reference inspection gauges and reference shop gauges; they are retained for the purpose of standardizing the other gauges.

### Cylindrical Gauges Measurement and Testing

We turn now to the measurement and testing of cylindrical gauges. For the purpose of merely testing a gauge to see if it is correct, two check gauges—a "Go" and a "Not-go"—may be used, and in some cases must be used. The difference between these will be equal to the tolerance on the gauge they are used to check and their own tolerances will be much smaller, but for cylindrical gauges in most cases check gauges are not necessary, and indeed are not desirable; the difficulties arising from inaccuracy of manufacture and wear are too serious. Besides, rejection by a check gauge gives no intimation of the error to the manufacturer, and thus it is unsatis-

factory to him. Thus cylindrical plug gauges are preferably checked by some form of accurate micrometer or measuring machine. To describe such machines in detail would fill a paper by itself; it must suffice to mention one or two leading points.

### Cylindrical Plug Testing Machines

The original Whitworth form depends on the use of a feeler, a bar which is passed down between the jaw of the machine and the gauge under test, and while high accuracy can be attained by practice the results are slow and depend on the skill of the observer. In another form, the plunger presses against a spring, and tilts a delicate level. The micrometer is turned until the bubble is central, thus securing that the pressure applied to the gauge is always the same; the importance of this is very great. It has been found useful at the National Physical Laboratory to replace the level by a tilting mirror; the machine is in adjustment when a ray of light reflected from the mirror occupies a definite position of a suitably-placed scale.

There was submitted a photograph of a large machine, built to the laboratory design, by Messrs Armstrong, Whitworth, in which this device is used. It is employed to measure large cylindrical gauges, and was built for the measurement of the coils of some of the standard electrical apparatus.

Another photo submitted to the meeting was an instrument in regular use for testing smaller cylindrical gauges. A vertical plunger pressed downwards by a spring actuates a light lever moving over a scale; below is a horizontal platform with a slow vertical motion. A standard gauge of the required dimension is placed on the platform which is raised until the upper end of the gauge pressing on the plunger brings the lever to the centre of the scale; the standard then removed, and its place taken by the gauge under test. The difference between this and the standard is given by the position of the pointer on the scale. In another instrument of this class, the motion of a diaphragm raises or depresses a column of liquid in a fine tube.

All these methods demand the employment of accurate standards of a large variety of lengths. Such are afforded by the now well-known Johanssen gauges. By means of these, length gauges differing in length by one or more thousandths of an inch can be built up with an accuracy amply sufficient for checking gauges to under the one ten-thousandth, and most of the test work at the National Physical Laboratory is now done by the aid of these gauges.

To discuss the problem how the Johanssen gauges are checked would carry us too far into detailed considera-

tion of such work, while how to make them is a secret many would wish to share with Mr. Johanssen.

The checking of ring gauges or of snap gauges is a more difficult problem. For many purposes check gauges are used—a "Go" and a "Not-go" plug the external diameters of which can be accurately measured, and indeed for small rings this is the only method. For larger gauges there are various forms of internal calipers available but these do not lend themselves readily to high accuracy. A method which has been found convenient at the laboratory is to build up a "Go" and "Not-go" internal diameter gauge, by means of a series of Johanssen gauges with two plain cylinders of known diameter, one at each end of the series. When once such a diameter gauge has been put together, the checking of a series of rings of the same diameter becomes a simple matter.

### Screw Gauges

The problem of the standardization of screw limit gauges is a very difficult one; a screw surface is a complex form and to satisfy oneself that in all its dimensions it lies within certain limits involves much careful work. The following definitions are taken from the report of the Engineering Standards Committee on British Standard Systems for Limit Gauges for Screw Threads.

**Effective Diameter.**—The effective diameter of a screw having a single thread is the length of a line drawn through the axis and at right angles to it, measured between the points where the line cuts the slopes of the thread.

**Core Diameter.**—The core diameter is twice the minimum radius of a screw, measured at right angles to the axis.

**Full Diameter.**—The full diameter is twice the maximum radius of a screw, measured at right angles to the axis.

**Crest.**—The crest is the prominent part of the thread, whether of the male screw or of the female screw.

**Root.**—The root is the bottom of the groove of the thread whether of the male screw or of the female screw.

**Slope of Thread.**—The slope of thread is the straight part of the thread which connects the crests and roots.

**Angle of Thread.**—The angle of thread is the angle between the slopes, measured in the axial plane.

**Pitch.**—The pitch is the distance in inches measured along a line parallel to the axis of the screw between the point where it cuts any thread of the screw and the point at which it next meets the corresponding part of the same thread. The reciprocal of the pitch measures the number of turns per inch or millimetre, as the case may be. See Figs. 1 and 2.

In the Whitworth thread standardized by the committee there are seven elements, and error in any one of these may

be sufficient to cause a gauge to reject work which ought to pass, or vice versa. These elements are as defined already:—Full (or major) diameter; Core (or minor) diameter; Effective (or pitch) diameter; Pitch; Angle; Form at Crest; Form at Root. Of these, the most important and the most difficult to control are the pitch and the effective diameter.

In the Whitworth thread the attempt is made to obtain contact over the whole surface of the screw. While possibly for some purposes this is desirable, it

FIGS. 1 AND 2.

adds greatly to the difficulties of both construction and gauging, and there is much to be said for a system which allows definite clearances at crest and root. Four of the above seven elements—the two first and the two last—then become unimportant, and we are left to concentrate on the effective diameter, the pitch, and the angle of the thread. If the screw bears along its slopes it is doing its work satisfactorily, and in most cases the fact that there is clearance at crest and root is immaterial. Before proceeding further, it is important to notice that errors in pitch and effective diameter are closely connected.

Suppose the full and dotted outline, Fig. 3, to represent a ring and a plug screw of similar form, but of slightly different pitch. Let the maximum relative displacement of any two threads engaged be  $2a$ . Then the extreme threads will be displaced axially by  $+a$  and  $-a$  respectively. A glance at the diagram shows that in this case the parts will not go together unless the axial displacement is accompanied by a radial displacement which, allowing for the angle of the thread, is about equal to  $2a$ . This is doubled on the diameter, so that as a rough rule it may be taken that any error in pitch has to be compensated by an error of twice the amount in effective diameter.

FIG. 3.

Thus we can compensate for an error  $p$  in pitch on a thread of which  $t$  in. are engaged by allowing a reduction of effective diameter of  $2pt$  in the plug, or an increase of the same amount in the ring. Some reductions in the full and core diameters are also required, but in consequence of the curves at crest and root these are small and need only rarely be taken into consideration.

Reducing the effective diameter of a plug, or increasing that of a ring screw, has the effect of reducing the thickness of the corresponding thread at that point; the thread is made thin. Thus, in order to compensate pitch errors, makers have a tendency to make their screws thin; they claim an allowance on effective diameter which makes up for the error tolerated on pitch.

The Engineering Standards Committee, in their Report No. 38, stated that they have had two separate matters to decide upon:—

(1) To lay down tolerances on full, core, and effective diameters to cover the wear of tools and unavoidable imperfection of workmanship, and to prescribe minimum allowances in order that bolts and nuts may be assembled freely.

(2) To decide what errors in pitch could be permitted in ordinary practice, having regard to the allowances in effective diameter which they entail, and as a result they recommended a series of tolerances for the two threads considered—British Standard Whitworth and British Standard Fine.

The report also gives formulae for the tolerances on pitch and the allowances on effective diameter required to compensate them, and tables setting out the tolerances on the various elements.

Turning now to the question of providing limit gauges for such threads, we are met with many difficulties. The committee, after a discussion of these, summarized their recommendations thus:—

### For Bolts

- 1.—"Go" and "Not Go" gauge of the "Taylor" type for pitch and effective diameter.
- 2.—"Go" and "Not Go" double gap gauge for full diameter.
- 3.—"Go" and "Not Go" double gap gauge for core diameter.

### For Nuts

- 1.—"Go" Standard Bolt, correct in all particulars, and made to the minimum diameters allowable.
- 2.—"Not Go" single thread gauge for full diameter.
- 3.—"Not Go" single thread gauge for effective diameter.
- 4.—"Not Go" cylindrical gauge for core diameter.

### Taylor Three Point Gauge

We shall see shortly what is meant by the "Taylor" type of gauge. For bolts, the three "Go" gauges recommended may be, and usually are, replaced by single "Go" ring gauge, a ring screw of correct form and dimensions. Such a gauge is difficult to construct and verify with accuracy; hence Mr. Taylor suggested for pitch and effective diameter a three-point gauge.

The three conical points, Fig. 4 accurately ground to an angle of  $55^\circ$  and truncated so as to clear the root of the thread, are described as follows:—Two are fixed on the lower jaw of the gauge, so that the distance between them is an exact number of threads representing twice the length of the screw contained in a standard nut of corresponding diameter. The third is fixed on the upper jaw midway between the two points on the lower jaw, and the three points are set to a standard male gauge having correct pitch and maximum effective diameter given in column 7 of table 1 or 3 of the report. Opposite the single point is fixed the flat face "a," which is adjusted so that the small cylinder "c" (of such a diameter that it will touch the thread about half way down its depth), will just enter the thread of a bolt made to the minimum effective diameter. Then in testing, if the bolt enters the gauge, and the "Not Go" cylinder refuses to enter the thread, the bolt is within the limits for pitch and effective diameter laid down in the tables, while any error in pitch which may be present will be duly compensated by a reduction in the effective diameter.

#### Using Ring Thread Gauges

With this gauge a "Go" and "Not go" ring gauge is used for the full diameter, and a "Go" and "Not go" snap gauge for the core diameter. With a complete ring gauge for the "Go" gauge, "Not go" gauges are required if the checking is to be complete for the full, core, and effective diameters. In practice it is generally considered sufficient to use a "Go" ring and a "Not go" full diameter gauge, though this opens the door to the employment of thin threads. It should be remarked here that a "Not go" screw ring is a useless and misleading gauge; it is difficult and costly to construct; it may tell you no doubt that the screw is wrong and ought to be rejected, but it affords no information as to what element in its form causes the rejection.

Up to the present no firm has undertaken the manufacture of the three-point pitch and effective diameter gauges, and they have not come into general use; they suffer also from the disadvantage that the wear is taken on the points, and even if these are properly hardened the life cannot be long.

It is easier to gauge a hole, for in this case the gauges are plugs. A complete plug gauge is required as a "Go" gauge, and, to be strict, three "Not go" gauges for the core, full and effective diameters. For the core the "Not go" gauge is a simple plain plug of appropriate size. For the full and effective diameters we use two screw gauges, each having a single turn of the thread; the first has a very thin deep thread, cut away on the slopes and at the root so as to bear only

on its crest, while the second is cut away at the crest and root, and bears on the slopes; the diameters are in each case of appropriate size, and the screw is rejected if either gauge enters appreciably.

ly. If a "Not go" core diameter gauge only is used, holes with thin threads, in which the effective diameter, and probably the full diameters are too large, will be accepted.

### INDUSTRIAL CONSIDERATIONS AFTER THE WAR

IN the course of his presidential address to the members of the Manchester Association of Engineers recently, F. W. Reed, M.I. Mech. E., reviewed some of the economic problems of the engineering industry which will have to be faced at the conclusion of the war. He said we were well acquainted with the organization and productive capacity of the great neutral power of the New World; will it be less or more powerful in industrial competition with the great influx of gold to it from, in part, our unpreparedness? The complete industrial organization of the chief central enemy Power stands by the war revealed; will that organization cease to exist with peace, or will it be intensified into greater perfection and activity? We shall be secure only in the latter belief. Already we had warnings that these countries are making strenuous preparations for capturing foreign trade after the war—we must be prepared. In most of our establishments general work had been displaced by the making of machinery for the manufacture of munitions, whilst in others both the shops and machinery have had to be adapted to the making of shell and other war material.

#### Plant Equipment Readjustment

One of the problems which will come with peace will be the readjustment of these establishments to pre-war conditions; therefore, the Government and all concerned will do well to give the methods to be adopted their most earnest consideration. The men as they became released from military duties, and who so desire, must be reinstated in their former occupations. At the same time there will be a number who will not return to the trade; apart from casualties there will be some who will no longer desire to return to their former trade, and some others shall remain in the army for the time being; in any case, we shall

be depleted of a number of skilled workers.

Mr. Reed said that there would be a demand upon our industries with the cessation of war there could be little doubt. The making up of leeway in civil requirements, the work of reparation and renewals until devastation had been obliterated, would still tax our energies to an extent little, if any, less than we were experiencing in the call for war material. There could be little doubt of our labor capacity for meeting that demand, providing it was organized on the best lines for economical production. The sudden change over of our manufacturing resources to civil work would be a task of considerable magnitude. A great quantity of additional machinery and new works which had been forced into existence by the war would be available, and could, no doubt, be largely utilized for civil work. Owing to the high-pressure conditions and the little opportunity to make good wear and tear of the past two years, considerable repairs would be necessary, so that a very liberal allowance for depreciation was imperative, not only to put our machinery in order, but to cover the cost of the unduly large number of machines which will have reached the stage beyond repair.

#### Restricted Output-Labor Dilution

Amongst the important problems that would arise after the war would be the questions of restriction of output and the dilution of labor, which even now are deserving of serious consideration. For the purposes of the war, trade unions had agreed with the Government to withdraw their rules bearing upon these vital questions on the understanding that they would be reinstated on the return of peace conditions. As a set-off to these conditions the employers were called upon to make considerable sacrifices in the way of handing over to the Government any extra profits above a certain limit which might be earned through their extra endeavors and running their works, in many cases continuously. If labor insisted that these rules shall be restored, the Government will have to comply; that was the present agreement, which cannot be departed from without the consent of organized labor. Whether it will be to their ultimate interest to insist on this restoration was a very important matter for their consideration, and both employer and labor must realize that the conditions of industry will be changed and both will have to meet the situation in a new spirit. Labor will do well to consider whether, after all, its own interests, and the interests of the nation, had been served well in the past, or would be in the future, by their late policy.

# PRODUCTION METHODS AND DEVICES

A Department for the Interchange and Distribution of Shop and Office Data  
and Ideas Evolved from Actual Practical Application and Experience

## EXPERIMENTAL WORK ON 4.5, MARK VII. SHELLS

By H. G. Evans.

ONE of the difficulties experienced in the manufacture of this shell was in getting the proper amount of stock on the in-

ner of shells were turned with a parallel diameter of 4.9-16 in. and having the outside of the nose beveled for a distance of  $\frac{1}{2}$  in., being then nosed in as far as possible, but leaving just enough to barely clean up on the outside. Section A. in Fig. 1, shows the outline of wall

FIG. 1. SHOWING THE VARYING SECTIONS OF SHELL NOSE OBTAINED.

side of the nose below the undercut. Numerous experiments were conducted with this end in view, one of which con-

obtained by this operation, while section B. shows a shell of the same dimensions after nosing and punching, from which it will be seen that the latter operation provides ample stock to form shoulder.

The temporary apparatus employed for the combined nosing and punching operation is shown in sketch, Fig. 2, a vertical four-column hydraulic press being employed. The shell A is placed inside of a cylindrical casting B, which guides the die block C, the hole in which is formed to fit shell so as to keep it from swelling when the punch D is forced in. In performing the operation a set of clamps were used to hold die block C down to platen so that weight of descending parts would strip the shell off the punch. Such a procedure was not satisfactory, as the punch remained fast in the shell.

To carry out this method of nosing successfully would require either a bulldozer or hydraulic press with pull back cylinder. The latter method would seem most desirable, a supplementary cylinder with pull back being mounted on top of the main press, so that after the shell was driven home into nosing die, the punch would be driven down through the hole in the die and into nose of shell, while the main cylinder holds shell firmly in place.

The punch used was  $4\frac{3}{4}$  in. long, tapering from  $1\frac{7}{8}$  in. to  $1\frac{1}{2}$  in., but this amount of draw was not sufficient to release punch with the inadequate apparatus used for the experiments.

## METHOD AND FIXTURES FOR MACHINING CENTERED TEE

By F. Scriber.

THE method of machining the centered tee illustrated by Fig. 1, is an example of simplicity and good judgment where the cost of machining must be held within moderate limits. This is realized when it is considered that although the method of handling is odd, only one special fixture is necessary and this is for the turret lathes, illustrated by Fig. 4.

FIG. 1. CENTERED TEE WHICH IS TO BE MACHINED.

Referring to Fig. 1, the work which contains three centre holes and one drilled hole, is first handled by locating the centres of the various bosses by means of the standard centering device illustrated by Fig. 2. This device is a bench fixture, and is also used for centering

FIG. 2. ILLUSTRATING APPARATUS FOR UPSETTING SHELL NOSE.

sisted of driving a punch down through the nose after it was pressed in the regular way. In conducting this test a num-

FIG. 2. STANDARD FIXTURE USED FOR CENTERING.

many classes of work by placing one end of the work in the bell mouth of the base casting, when by letting the upper slid-

ing member drop over the work the centre may be prick-punched as shown in the illustration. After prick punching all the bosses in the centre the three short bosses are centered by means of an arrangement similar to that shown in Fig. 3. This consists of a speed lathe, the chuck of which holds a combination

FIG. 3. ARRANGEMENT OF SPEED LATHE FOR CENTERING.

drill and a countersink, A, while the tailstock is equipped with a bell mouthed centre, B. In use the work is held as shown and the tailstock spindle is advanced in the usual manner to make the cut, while, by holding the work by hand to prevent it from turning, the centre is drilled. The final operation on this piece is a turret lathe job which consists of drilling the hole, etc., and by referring to Fig. 4, the method of tooling will be readily apparent. In holding the work for drilling full use is made of the centre holes in the short bosses, as the work is gripped between two pointed screws, A. and B., in a spindle nose fixture, C, using a spring pin D, to locate the work central, as the screws A and B are adjusted in or out until the spring pin, D, fills the hole, X, at all points; in this position the spring pin is clamped by the screw, E, thus holding the boss to be drilled in line with the spindle of the machine.

The screws, A and B, are now tightened to hold the work securely in place while the hole is spotted, using drill F in 1st turret hole. Following this, the

ret hole, while the fourth turret hole contains a tap for cutting the thread. In connection with this illustration, it will be noticed the spindle nose fixture has a guard, L, which swings over and protects the operator from getting caught in the screws, thus making a safe and simple fixture of cheap design.

### LITTLE KNOWN FACTS ABOUT GRINDING—FORM GRINDING

By Howard W. Dunbar.

IT IS not necessary that the face of the grinding wheel always be straight as it is possible by the use of special truing fixtures and devices to shape the face of the wheel in a manner which makes it possible to grind forms in various kinds of work.

In form grinding, as in form milling, it is essential that the shape be continuous and uniform. It is impossible, of course, to grind under-cuts or varying shapes in a given form. Not every shape can be ground, any more than can every round piece of work be finished by the grinding process. Sharp corners should be avoided, not because of the inability of the truing device to shape a sharp corner, but rather because the small particles of grain and bond of the wheel which go to form the corner will not stand up and grind long enough to maintain such a shape. This follows because there is so much work required of so few particles of wheel that naturally they wear out and break away very quickly.

Still another factor which must be considered in form grinding, is the varying depth of wheel face of the shape which is being ground. The wheel acts differently, of course, all along the form, depending on the distance that the cutting particles are from the centre of the wheel, since irregular shapes in the face of the wheel cause the wheel to vary in diameter all along the width of

form finish or rate of production cannot be maintained.

The limitation in form grinding is therefore governed by three things: The capacity of the attachment in producing varying shapes, the physical possibility of the grinding wheel to maintain a given form, and the depth of the hills and valleys in the face of the wheel, caused by the form, which affect the peripheral speed of the cutting particles.

### Frequent Truing Necessary

The wheel must be trued frequently on form grinding to maintain the shape, especially where there are abrupt changes in the contour, such as sharp corners, small radii or deep cuts. Long sweeping curves or shapes which blend well into each other maintain their form more uniformly and for a greater length of time than do the more irregular shapes with sharp corners and angles. There are probably a great many machining operations now performed by other processes which could be readily accomplished by form grinding, effecting a saving in cost and producing a more accurate job with a finer degree of finish. The use of the grinding machine for this class of work is increasing as people come to realize the possibilities in shaping work which requires accuracy and good finish.

Flat work ground on a surface grinding machine can be formed just as well as round work on a cylindrical grinding machine. The only difference in these two methods of grinding is in the manner of handling the work. On the surface grinding machine the work is moved under the wheel on a reciprocating table; on the cylindrical grinding machine the table cannot be moved, and the wheel with the shape formed in it must be fed straight into the work.

One illustration of the usefulness of the formed wheel in producing shaped

FIG. 4. METHOD OF TOOLING UP TURRET LATHE FOR MACHINING HOLE.

in first turret hole. Following this, the G, and is counterbored, using cutter H, held in holder, J, in second turret hole, following which the hole is reamed using a floating reamer, K, in third tur-

the form, and if this variation in these diameters amounts to enough to vary the peripheral speed of the wheel materially at various points in the form, the wheel acts differently, and a uni-

parts is in the crowning of pulleys. The crown can be made accurate within .001 in. on either diameter at the edges of the pulley, and the height of the crown be less than if turned.—Grits & Grinds.

## THE ENGINEER AND HIS ADVERTISING—I.\*

By Chas. B. Penwarden.

**T**HE modern engineer is a philanthropist. I have come to that conclusion after many weary hours of wandering through the advertising pages of British engineering trade journals. Another discovery I have made is that the profession which is obviously one of the most punctilious and exact is the one profession which totally ignores its own teachings when dealing with the publicity for which it annually pays away a very large sum of money—hundreds of thousands of dollars.

### Keeping One's Name Before Public

It is a common saying among men in certain businesses that advertising may be all right for the man next door or in the next street, or on the next floor, but so far as they are concerned they have done certain things for so many years and they see no sound reason for changing. They are well known, and it is but a matter of keeping their name well to the front. Some of them have this disease so bad that while they would scorn to be associated with the name of a pill in twenty feet letters upon a wall, yet they commit a far greater offence by having their name in three-inch letters in the trade papers, being presumably under the impression that all its readers are badly troubled with myopia.

I have said that the modern engineer is a philanthropist because I cannot understand, from an examination of his advertisements, how he can expect the money he pays for space to do very much else than keep his trade papers in a more or less flourishing condition. Sometimes, in conversation with engineers, I have been conscious of a fleeting impression that all this good money is spent more as a concession to a custom than for any other reason, but there happens to be a sufficient leavening of wide-seeing men who believe in getting full value from the space they buy, and so I am forced to the conclusion that the vast majority of engineers buy space but attach very little value to it—so small a value, in fact, that they think it scarcely worth bothering with.

### What Investigation Shows

Careful calculation has shown that not one-half of one per cent. of the firms who use space in engineering papers have any definite idea of what to do with the space, and in the case of the minority it is plain to see the mark of the train-

ed hand. It is interesting to pick out those advertisements which are calculated to result in increased business and to note the ingenuity displayed in working up the various points of value in selling, but the numbers of specimens of this high-class work are so very limited that it leaves one altogether puzzled to understand why large and reputedly go-ahead firms lag drearily in the backwaters of the modern publicity stream. They remind me of people who have hired a motor boat and have no idea how to start and attend to the engine.

There is another point about engineers' advertising—in fact, there are several, which I shall have to demolish before I can begin reconstruction—which always puzzles me, and that is the very prevalent idea that engineers are not as other men. Engineers themselves do not say this. It is just the impression conveyed by their manner and ideas where publicity is concerned. I have yet to learn that engineers eat, drink, sleep, marry or die in any way different to any other people, that their amusements are of any different character, that they talk or keep silent, go to church, chapel, or golf, in any way peculiar to themselves, or that they breathe faster or slower, walk backwards, or do anything in any way whatever different from the average human being. Yet many have solemnly told me that a specific thing might do for or appeal to any other business on earth except the engineering, and in so expressing their opinions manage to convey the impression that—thank God, engineers are not as other men!

This is not done in an offensive way; quite the contrary. In business I like dealing with engineers, as I always find them more courteous and considerate than men engaged in many other lines of which I have had experience, and I attribute the fact largely to the higher standard of education which is necessary for any degree of attainment to be reached in this particular profession. This fact makes it the more difficult to understand why engineers' advertising is worse than that of any other business. I have tried to find out why this should be so, and I have come to the conclusion that, generally speaking, the engineer of to-day, from an advertising standpoint, is from fifteen to twenty years behind the times. Anybody can prove this by comparing the advertisements which appeared twenty years ago with those which are now appearing. Many other businesses have gone ahead with the times, but the engineer has stood still—which is just

the sort of thing one would imagine an engineer would not do.

### Too Limited Advertising Appropriations

There is, however, in my opinion, a reason for this which has no connection with engineering at all, and it is that a great deal of the tremendous progress which has been made in advertising is due to professional advertising men who have made the business of advertising what it is to-day. While many industries have been benefited by this special work, the engineering profession has suffered on account of the limited appropriation which has been allotted. This limited appropriation is, in most cases, unavoidable because of the restricted field. From the advertising man's point of view it is easy to see that, working as he usually does upon a 10 per cent. basis, businesses and industries likely to need the spending of \$100,000 a year upwards offer more attractions than those which scarcely ever rise above \$10,000 or \$15,000 a year. This means that there is less competition among the best men, and so the engineers' advertising is left, largely, to the mercies of a general utility man, helped occasionally by the manager or managing director and sometimes by the board of directors. The result is seen in the typographical and etymological horrors which are perpetuated in each succeeding issue of the trade papers.

Now, if an engineer were to ask me what I knew about engineering I should promptly answer "Nothing." Therefore, am I a dependable critic, not of engineering, but of the attempts of the engineers to sell their products.

If I asked an engineer what he knew about human nature, he might answer "Nothing," and he might answer—something else, but the fact would remain that he would be condemned either way—by his advertising.

### Why Engineers Seek Publicity

If we analyse the reasons why engineers spend money in publicity we should probably arrive at the following conclusions, or some of them:—

1.—Because he believes in supporting his trade papers.

2.—Because others in the same line do it.

3.—Because he has been canvassed by various representatives, and does it in order to get a little peace.

4.—Because he wants the business.

As no good purpose is served by discussing the first three, we are reduced to No. 4.

We believe that the average engineer

\*From Herbert's Monthly.

spends money in advertising because he wants more business.

On the one hand, we have the section which screams its message at us like a Cheap Jack at a fair, and on the other, we have the dignified person akin to the poor old lady reduced in circumstances who tried to make a living by selling fish, and who wrapped her wares up so that nobody should see them, and then whispered "Fish! Fish!" to herself in an agony of apprehension lest anyone should hear her. Both of these methods are the direct result of ignorance of the proper functions of advertising. The use of ink on paper is but a method for conveying a message to those who can be reached by no other means at so cheap a rate. Advertising should be salesmanship in print. When we realize that, we realize in a flash all the shortcomings of engineers' advertising. It is advertising inasmuch as its appearance suggests something to be sold, but it is not salesmanship because it does not sell—except by accident; and the reason that it does not sell is because it is not constructed to sell.

#### Effective Advertising

To be effective, an advertisement must possess the power to shift money from the pocket of one person to the pocket of another; and in order to accomplish this the advertising must talk; and before it can talk it must find something to talk about, and the place to find that something is in the goods.

Now, if two firms make an article exactly alike, both equally dependable, of similar workmanship and of identical design, who will sell the most? Obviously the firm whose selling organization is most effective. It may be done socially; it may be done by less worthy methods; the name may do it, and it may not; influence may help, and probably does; but these methods are not wrongfully described as archaic, because it will be proved eventually that the firm which talks the longer, more sensibly and clearly, explains more, finds and gives reasons for the preference being given to its goods, and persists, will in the long run, *ceteris paribus*, be the winner. This when the two articles are of equal merit. When one has an advantage there is all the more reason why that advantage should be pressed by right advertising methods.

There is another obsession prevailing amongst engineers which proves that they have not advanced along the high road of publicity to the same extent that they have advanced along other roads, and that is found in the prevailing tendency to compare American advertising methods with their own to the detriment of the latter. In this connection the following extract from *The Electrical Times* of June 22nd will be of distinct interest and value:—

"Englishmen are occupied with Germany and its preparations for crushing our trade after the war. That is a very proper occupation: we wish it every success. Germany will ultimately rally from the knock-out; her future must be watched; but it is remarkable that very little attention is being paid to America. At present the United States are satisfied with their profits, as they have reason to be, in all conscience; they are fabulous, but what is to happen when their industries grow hungry? Current engineering literature from America evokes our admiration. Here is the *General Electric's* domestic magazine, for instance, weighing 1 lb. and packed with such a wealth of technical information in its 567 pages as no one technical journal in Britain could afford to produce.

"Wealth bubbles over; it oozes from every American pore. The latest *Electrical World* weighs well over 2 lbs. and costs 18 cents to post, but it was sent out to English station engineers. Let any reader take a glance at the plutocratic pages of such publications as these; let him note the lordly manner in which the American firm advertises in them; and then let him say whether beaten Germany, crouching for a spring at our throat, but ham-strung by financial disaster, is really the force which is destined to baulk our foreign enterprise of the next few years. We do not believe for one moment that our American cousins are out for anything but dollars, they have no ulterior object such as Germany had; they prefer to see us survive and prosper; but even as bedfellows their sheer mass of adipose tissue may leave us without any blanket and give us the worst cold we ever had in our lives."

#### American Advertising Methods Instructive

These are words which every engineer would do well to take to heart. The same arguments used against American publicity methods by engineers to-day were used by most other advertisers ten or fifteen years ago. That a good deal can be learned by a study of American engineering advertising is easily proved by a perusal of American engineering journals. There will be found very little clap-trap or vague assertions in these journals to-day; not so much, in fact, as is to be seen in some British publications. The reason for this difference in interest and attraction is due to a better understanding by the American engineer of how to make most directly the point of contact with the reader.

What does the manufacturer of electric lamp reflectors sell? Reflectors?

Certainly not. He is selling the better control of light rays, better conditions for workpeople, reduced current consumption, better and more accurate work, and so on.

What does the manufacturer of an electric motor sell? Electric motors?

Not if his selling is along the right lines. He is selling cleanliness, money-saving, freedom from rattling belts, forests of pulleys, simplicity of operation, and many other items of a similar character according to circumstances.

No goods are sold for what they are, but for what they will accomplish. What would be the use of building or buying engines unless something had to be driven or pulled? Nobody would want them to look at. Battleships are not built for fun, but for defence. Bridges are not built for pastime, but for convenience; and so on through the whole gamut of the engineering industry; but nobody would ever think so, to read most of the engineering advertising which is the direct cause of such prodigious waste of good money. To considerably improve the advertising is not a difficult matter. Most of it consists in simply answering one interrogation—"Why?"

All factory managers should insist upon the immediate installation of the Bineo ventilating system.

Why?

Because, etc., etc.

All workers on lathes and similar machines should be protected from glaring lights by a Justit patent reflector.

Why?

Because, etc., etc.

Why should we not use the Justso reflector?

Because, etc., etc.

#### Essence of Good Advertising

Good advertising consists in answering the unasked questions of the reader. It means thinking ahead. For everything there is a reason. Give the reasons and you answer the unasked questions.

Back of every man's mind is antagonism to advertising. This antagonism is neutralized by the appeal to the weaknesses or to the strength of the reader. Antagonism subdued, curiosity awakens. Satisfy that curiosity and you create interest. Maintain interest, and from it confidence will emerge. Handle it intelligently and that confidence will in turn create business, and back will come your money from the advertising.

Apply the test to your own advertising. Does it create any desire in you to spend money? Would you buy the goods if you were not an advertiser? Or, if you had to buy, would you buy from your own firm because of the advertising?

Here's another test. Suppose your advertising is costing you \$2,500 a year. Would you pay that \$2,500 to a representative to walk around and repeat to potential customers the same things as you say in your advertisements?

If either of these simple tests fail you cannot be getting all the value from your advertising expenditure that is possible.

# CONTEMPORARY WAR ARTICLES

Embracing Information and Data Drawn from a Variety of Sources Relative to and Arising from the Prosecution of this Many-Sided European War

## WOMEN AS SHELL MAKERS

**D**URING the past few days I have been privileged, says the Sheffield correspondent of the *Engineer*, London, England, in a recent issue, to pay a special visit to several of the big munition works in this district, and whilst, of course, little of what I say must be re-recorded, this may be said that there need be no anxiety about the rate at which shells of all sizes are being made. If no general movement is made toward the reinstatement of one day's rest in seven, it will not be because the production of war material is behind. Nothing of that kind is lagging. The various shell "shops"—factories they are—seem to have got into their stride; and it is a stride!

### Munitions Plants a Revelation

Simply to pass through the works is a revelation. The armament works are charged by some people with losing time at the beginning of the war. They are losing none now. Not that I, for one, ever believed they were guilty of doing so. They could not run before the Government, and in the very early days of the war the Government appeared to be of the number who failed fully to apprehend that we were entering a long period of hostilities, for which we were by no means adequately prepared. The great armament firms simply waited for the signal from the Government to launch out upon a policy of works expansion in the interests of war output, and if that signal had been given sooner the task in which every munition works is now deeply involved would have been begun earlier.

However, the actual part played by the armament firms will be better understood when the smoke of war has cleared and the country is able to review the whole circumstances in an atmosphere of calm philosophy. Then these firms will have nothing to reproach themselves with. What struck me most during my visit to the works was the increasing part which is being taken by women and girls in the duty of making shells. At one place an official assured me, with an air that seemed reminiscent of the old prejudice against female labor in such places, that there were only about half a dozen women workers on the premises; but then it happened to be a place where the output is, generally speaking, far too heavy in character for women to handle, and quite exceptional.

### What Women Can Do

On the other hand, I saw some shops

half filled with women and others with only a very small percentage of men. In the latter I noticed a curious thing—the women wore distinguishing caps, khaki, blue and red. In that fact there is more than just meets the eye, and a little explanation would not, perhaps, involve the revealing of any secrets. The women wearing khaki caps are plain shell turners. So long as their lathes are in order and everything works smoothly they are quite competent to go on adding to the production of ammunition for the men at the front. Those in blue caps are broadly called bench hands, as being much more skilled in the handling of the tools, while the red-capped women have passed a kind of examination in taking down and setting up the machines. This examination is, I believe, quite a severe test for them. Every piece of the lathe has to be laid on the ground and then picked out as it is required for setting up, and in order to ascertain whether or not the candidate for a red cap has the requisite intelligent knowledge of what is required of her, pieces from other machines are sometimes introduced amongst the actual pieces, and unless she detects these she fails to pass the inspection, and has to try again later on. The examinations, I hear, are working out very favorably for the women, who in some cases have entirely outshone men who have undergone a similar training. The management of one particular place was very loud in its praises of the work women are thus doing, declaring that they took a real intelligent interest in their work, with the result that, if anything went wrong with a lathe, they could tell at once where the trouble was and could remedy it.

### Male Operator Attitude

I had a curious little experience, however. Wondering what the attitude of the ordinary skilled fitter—the mere man, was towards the red-caps, I questioned one. "Oh," he replied, "they do it like parrot work. They'll do just what they see you do, but why they have to do it, and what is really the matter, they don't know. They do all right with someone to supervise them, but they're not like us chaps, as knows what's what as soon as we look at it." All of which sentiments may possibly arise from a little professional jealousy; but, whatever view the ordinary fitter may take, he works well and loyally with the women just now in the interests of the great national need, leaving the question of delicate readjustments of industrial conditions to look after itself for the

time being. There will, of course, be many difficulties beside that one to face after the war, but it is needless to worry about them at present.

### Bad Timekeeping Less Serious

One director mentioned to me, with a shrug of the shoulders, that although his firm had not yet had recourse to the Tribunal, so far as the women workers are concerned, they had just seriously warned some of them that such a step would be taken if they did not improve their time-keeping. "Are they learning the tricks of some of the men?" I asked, meaning the slackers. "Yes," he replied, "they are learning the tricks of some of the men and adding to them all the tricks they seemed to know previously. When they get into the habit of bad time-keeping they are worse than the men. However, I think after the warning I have given them some improvement may be looked for. Personally, I am just passing into the third stage of my experience. At first I was enthusiastic about the employment of women as shell turners, then I became despondent about being ever able to make them really useful in that direction; now I am gradually returning to the condition of enthusiasm, and am in hopes that this time there will be permanent justification for it."

### Women Workers' Welfare

One thing I should like to mention before passing from the subject, and that is the very admirable arrangements made on all hands for the comfort and accommodation of these women workers. Everywhere one sees splendidly equipped canteens coming into existence, and the old temporary arrangements done away with. Recently I was invited to inspect one of these canteens—of which, I believe, Vickers were the pioneers—at Cammell Lairds. The kitchen arrangements were perfect, the accommodation generally was most complete, the place was well lighted, warmed, and ventilated, and there were seats and tables for 400 at one sitting. This building, which was fitted with electric light, was only one of the firm's provisions for the welfare of the female employees. At some places the canteens will accommodate even larger numbers, and one which I have inspected just recently will seat no fewer than 2,000 at once.

The necessity for these innovations will, I fancy, revolutionize the whole idea of working conditions after the war, and the sort of thing that is now being done for women will be extended to much greater lengths than before for

men and lads. It will probably prove to be one of the many lessons derived from the war conditions, and may help very materially to improve, where it is required, the relations between capital and labor, and by viewing matters from each other's point of vantage, assist in a clearer recognition of mutual interests. There are some difficult problems ahead for the two sides to face, and anything that will assist in smoothing the way for their amicable and permanent settlement should not be neglected.

### What Employers Think

That, obviously, is a big subject, and one that cannot be lost sight of, though some are inclined to shelve it. The Master Cutler (Mr. W. H. Ellis, managing director of John Brown & Co.,) says that in Sheffield employers and workmen feel as strongly as anywhere what their rights are, and are prepared to urge them with all the arguments they possibly can, but that they never embark on strife without exhausting every argument that can be used. That, he says, has been their policy in the last few years, and they are determined that it shall continue, because it has given Sheffield a good and creditable name in the country and has established a feeling that if any work is placed in the city there is not likely to be any serious upheaval as between employers and employed. Mr. Ellis adds the hope that in ten years from the termination of the war he will be able to repeat those words. Everyone will endorse the hope, and everyone knows that, if only common sense prevails, it will be realized.

### THE EVOLUTION OF THE "TANKS"

THE statements in the British House of Commons by the Secretary of State for War on Thursday, October 12, and by Dr. Macnamara, Parliamentary Secretary of the Admiralty, on Wednesday, October 18, in answer to a question by Captain Burgoyne, are probably the communications promised some time ago regarding the evolution of the "tanks" to be made with the view of giving credit where this was due.

It was made clear that E. H. Tennyson D'Eyncourt, C.B., the Director of Naval Construction, is entitled to full credit for designing this "formidable weapon of warfare." It would seem that a suggestion was made by several officers of the Royal Naval Air Service, as a result of experience in Flanders, to Winston Churchill, when the latter was first Lord of the Admiralty, in favour of the use of some armoured vehicle capable of traversing the irregular ground of "no man's land," of straddling over trenches and breaking down obstacles, and of scattering destruction from the

guns within it, while being itself reasonably protected against gun fire.

Mr. Churchill, with that characteristic freedom of mind for the reception of new ideas, and courage for putting the potentialities of all such proposals to the test, gave heed to the suggestion, but in mechanics an idea is one thing; the evolution of the details of design to carry the idea into practical effect is quite another. The history of invention shows a great store of ideas incapable of application, as well as a rich record of long-entertained ideas successfully applied. The suggestion of caterpillar wheels is old, and has long been applied for the traction of guns over moderately irregular ground.

### Foreign Claims Get Quiet

Many proposals for movable forts with such caterpillar wheels have been put forward from time to time, and we are amused to find that some of the suggestions by Americans have actually been published as illustrative of the system adopted in the "tanks" of the British Army now in use in France. The Americans claim that these are their invention, and, in fact, that they were manufactured in the United States. Germany also lays claim to the origination of the ideas. In connection with the question asked by Colonel Griffiths in the House of commons on the 12th inst., as to whether the "tanks" were entirely of British material, it is of interest to point out that everything was of British design and manufacture.

While it is not permissible to enter into any details regarding the wonderful engineering features in the design of the "tanks," it will be found that the ingenuity displayed in securing the long wheel based on the caterpillar chain principle is exceedingly novel and worthy of the highest tradition of British inventive ingenuity. When Mr. Churchill instructed Tennyson D'Eyncourt to prepare the design, the great limitations of former proposals were freely recognised, and there can be no doubt that the then First Lord of the Admiralty rendered great service in the masterful encouragement which he gave to the Director of Naval Construction.

During the preparation of the design and experiments Mr. D'Eyncourt suggested the appointment of a small Admiralty Committee, which should consult with representatives of the War Office as to the military conditions to be fulfilled. This Mr. Churchill at once agreed to making the Director of Naval Construction the chairman of the committee, whilst the secretary was Lieutenant (now Lieut.-Colonel) A. G. Stern, whose practical business ability, as Lloyd George said, had been invaluable in securing the manufacture on a con-

siderable scale of this weapon of war. Colonel Swinton also, according to the Secretary of State for War, has been a most enthusiastic supporter of the idea, and the fact that it was carried through with such zeal was very largely due to the enthusiasm which he threw into the work.

All through the evolutionary stage, Mr. Churchill, the First Lord of the Admiralty, took a very active part, stimulating all concerned, and when the proposal for representatives from other Departments was made, Lloyd George gave the scheme his unstinted support. Mr. Balfour, when he went to the Admiralty as First Lord, equally supported the work of design and experiment. The other officers mentioned by Dr. Macnamara as assisting in the work were:—Commodore Sueter, Wing-Commander W. Briggs, Squadron-Commander T. G. Hetherington, W. O. Tritton (managing director of W. Foster & Co., Lieutenant W. G. Wilson, R.N.A.S. (now Major Wilson, M.G.C.), P. Dale Bussell (Contract Department, Admiralty), Lieutenant A. G. Stern, R.N.A.S. (now Lieut.-Colonel Stern, M.G.C.), Captain Symes, M.G.C., and F. Skeens, Acting Assistant Constructor.

### First Tank Enterprise

It was as far back as the summer of last year that the first "tank" was ordered to be made from Tennyson D'Eyncourt's design. The results of the trials were very satisfactory. The late Lord Kitchener, as well as the Lords Commissioners of the Admiralty and Lloyd George, were particularly pleased with its attainments. When the Army authorities became convinced of the utility of the machine on the battlefield, it was decided to build a number of such landships from the same designs. It was at this time very properly decided that the supervision of construction should be under the control of the Ministry of Munitions, and a committee of that Department was appointed to carry out the work. Lieut.-Colonel Stern, who had before acted as secretary of the Director of Naval Construction's Committee, was made chairman of the new committee, while Colonel Swinton took over direction of personnel. At the request of the Ministry of Munitions, and with the approval of the Admiralty, Tennyson D'Eyncourt continued as a member of this committee, and was, and is still, chief technical adviser, and no doubt has worked out further developments of the "tank."

When it is possible to disclose the details of the design, it will no doubt be seen that in most of these details there is great originality, and that naval architectural experience has in this, as in other respects, greatly assisted the

army in the field. The secrecy with which the operations have been carried out merit high tribute, not only to those immediately engaged in the designing work, but also to the workers who have been employed in construction. Although Lloyd George could not enter into any details as to his association with the idea, it is only fair to say that that vigour which has ever actuated him was an important factor in the carrying through of the work of constructing the "tanks" which have been so invaluable, and promise to continue to be invaluable, at the front.—Engineering.

### THE L.33 ZEPPELIN

ACCORDING to *The Times*, the Zeppelin which came down on September 24, in Essex, England, has a framework or skeleton composed of a series of longitudinal lattice-work girders running from end to end and connected at intervals by circular lattice-work ties, the whole structure being bound together and stiffened by means of a system of wires provided with arrangements which enabled them to be tightened up. The material used is an alloy of aluminum, resembling, but, it is said, inferior in quality to, that known as duralumin. At the largest point the framework has a diameter of 72 ft., and is of stream-line form, the bow being sensibly blunter than the stern, which, indeed, tapers off to a sharp point. The length of the vessel appears to have been 650 ft. or 680 ft., and the weight complete, with engines, fuel, guns and ammunition, is calculated at 50 tons. The hydrogen capacity was 2,000,000 cub. ft., and there were 24 ballonets, extending the whole length of the ship. The airship was built last July, and its cost is estimated by the Admiralty authorities at about a quarter of a million.

To enable the crew, which consisted of 22 men, to move from one part of the ship to another, a cat-walk ran along the keel, enclosed in an arched passage. It consisted of a narrow footway, 9 in. in width and made of wood—one of the very few examples of wood construction used—and provision for ventilation was made in the shape of shafts rising to the top of the ship. In all there were four gondolas—one forward, two amidships, and one aft. The forward one constituted, as it were the navigating bridge. It was divided into three parts. The first was set apart for the commander, and in it were concentrated the controls of the horizontal and vertical rudders at the stern (where also there were four stabilizing fins to prevent rolling), the engine-room telegraphs, and the switches for the electrical release of the bombs. These last, of which 60 were carried, were arranged amidships, and the slid-

ing door which was opened to allow them to fall can still be seen moving freely on its bearings.

Behind the commander's room in the forward gondola was a cabin for the wireless operator, measuring perhaps 6 ft. by 4 ft., and behind that again an engine-room containing a 240-h.p. Maybach-Mercedes engine having six vertical cylinders. Behind the engine was a clutch, a brake, and a reducing gear, through which the power was transmitted to a propeller shaft; a generator for the wireless installation was placed in front. One similar engine was carried in each of the gondolas amidships, and three in the aft gondola, all the engines having wireless generators attached. There were thus six engines, with an aggregate power of 1,440 h.p., and six propellers. Of the latter, three were worked from the aft gondola, one being placed in the centre at a point distant from the tail about one-fifth of the length of the ship, and the other two one on each side; two were driven from the side gondolas amidships, and the sixth was in connection with the forward gondola.

To reduce air resistance a stream-line form was given to the propeller stays by the aid of a thin two or three-ply wooden casing shaped in the proper way. The amount of petrol carried was 2,000 gallons, and the speed is supposed to have been about 60 miles an hour in a still atmosphere. The armament, apart from the bombs, consisted of nine quick-firing guns. Of these, two larger than the others, were mounted on the roof, two were in the forward gondola, one each in the amidships gondolas, two in the aft gondola, and one in the tail. The lightness of the construction is shown by the fact that the huge tail, still containing the remains of the gun platform, can easily be rolled over by one man.

### GERMANY OUSTED FROM AUSTRALIAN METAL INDUSTRY

THE attack on the German metal octopus, which was first made by Prime Minister Hughes, of Australia, has excited considerable interest all over the world. It is not too much to say that the manner in which the campaign was instituted, carried out, and pushed in spite of tremendous obstacles to a successful conclusion, first revealed the strength of the Australian Prime Minister, and no doubt introduced him to the world at large. Following quickly upon the heels of the unmasking of Germany's position, came in rapid succession a number of Parliamentary Acts which took completely the metal industry out of the hands of Germany, and it is not too much to say that as far as Britain is concerned, never again will Germany control the metal market of the world. Some of the Parliamentary Laws put

through the Australian National Parliament may be briefly stated:—

Cancellation of all mineral and metal contracts with enemy companies and firms by the Commonwealth Government of Australia. This Act has been lately adopted by the British Government.

Dissolution of the Lead Convention controlled by Germany, which determined the output and price to producer and consumer of all Australian lead.

Dissolution of the Zinc Combine, by which Germany controlled the world's spelter market, price and output, and manipulated the market so as best to serve Germany.

Complete destruction of the gigantic Aaron Hirsch and other German Trusts which controlled the copper industry in Australia.

Destruction of all enemy agencies controlling tin, molybdenite, wolfram, and other metals.

In connection with the German control over lead, zinc and copper, it cannot be too strongly stated that it was complete, and affected not only the producer and the consumers in Britain and elsewhere, but by fixing the world's price for the metals, and limiting the output it directly controlled and affected employment and wages.

England was slow to follow the lead set by Australia, but eventually did so, thus making a uniform metal policy all over the British Empire. The ground having thus been cleared and the German influence rooted out completely, the work of constructing the whole matter on a purely Australian and British foundation has been entered upon promptly and systematically.

### NICKEL COMMISSION PREPARING REPORT

THE report of the Ontario Nickel Commission will, it is expected, be submitted to the Legislature at the next session. The members of the commission have practically completed their investigations and are now engaged in the preparation of the report.

While the labors of the commission are associated in the public mind largely in connection with means of refining nickel in Ontario and controlling the export of the unrefined nickel, by no means the least important part of its work has had to do with the shaping up of a comprehensive policy of mining taxation applied to all Ontario's great mineral resources. If this part of the report is ready in time Hon. G. Howard Ferguson may be able to bring down the promised tax legislation at the coming session. Meanwhile the plant being established at Port Colborne on Lake Erie for the refining of Ontario nickel by the International Nickel Co., is under way.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## CUTTER RELIEVING MACHINE

**T**HE Cleveland Milling Machine Co., Cleveland, O., is now building a cutter relieving machine which is illustrated and described herewith. It has been developed for the special purpose of relieving formed cutters up to 13½ in.

in solid tapered phosphor-bronze bearing-compensating for wear. The taper hole in the spindle is No. 10 B. & S., and the spindle is bored to accommodate a 1-in. draw bolt.

The tailstock spindle is 2½ in. in diameter and is bored No. 10 B. & S. taper; it has a maximum adjustment of

ly positioned in the proper relation to the cutter by means of a double adjustable toolpost which is graduated to 0.001 in. Provision is also made for bringing the cutter to be relieved in the proper relation to the form tool without loosening the cutter on the arbor or loosening the change gears on the end of the machine. Corrugated adjustable wedges on top of the toolpost provide for adjusting the amount of stock that is ground off the forming tool from ¾ to ¼ in. If desired, this cutter relieving machine may be motor-driven, in which case a 3 horse-power constant speed motor is employed, which is mounted on top of the headstock. The weight of the machine is approximately 7,000 lbs.

## HEAVY DUTY MANUFACTURING LATHE

THE advantages and economies of the single purpose manufacturing lathe having been convincingly demonstrated in the manufacture of shells, it was but a matter of time before refined designs of this type of machine would be available for use in general machine work. The increasing tendency in modern shops to confine thread cutting to one machine is constantly widening the field of the simple lathe and in the accompanying illustration is shown the Hercules heavy duty manufacturing lathe which is the refined development of a machine originally developed with the single idea of turning shells rapidly.

While capable of swinging 21 in. over the vees, the machine possesses the weight and proportions of the average 24 in. lathe, with correspondingly increased rigidity, and lessened cost of manufacture.

The headstock spindle is a fifty point carbon steel forging, ground on all bearing surfaces, and furnished when required with a 2¼ in. hole. The bearings are of the chain oiling type, and are provided with sight feed oilers showing the amount of oil in the bearings. Spindle thrust is taken by a hardened steel washer against the rear bearing, adjustment being made by a nut at the rear. A large diameter two-step cone pulley capacity of high speed tools, while five changes of feed are provided through a feed change box actuated by chain drive from the tail of spindle.

A splined shaft and worm gear operate the longitudinal travel of the saddle by rack and pinion, all gears being steel forgings with front and rear bearings, and a friction cone is embodied in

CUTTER RELIEVING MACHINE.

in diameter with any number of teeth from 1 to 28 inclusive, and any even number of teeth from 28 to 42 inclusive, giving straight, side or end relief on all cutters which come within the capacity of the machine. It will be noted from the illustration that box-type construction has been adopted for all large members including the base, bed, headstock and tailstock in which metal is generously distributed in both the walls and webs to provide ample strength.

Power is provided by a 14-in. pulley which carries a 3-in. belt and runs at 460 revs. per min. From this pulley the drive is through a set of reverse gears to a tumbler pinion, from which five selective spindle speeds are obtained, the drive being transmitted through a worm-wheel of large diameter which is mounted directly upon the spindle. The machine can be started, stopped or reversed by manipulating a single hand lever. The spindle is machined from a high-carbon steel forging and is 3½ in. in diameter at the largest point. It runs

7 in. by means of hand-wheel. Alignings which are provided with means of ment of the tailstock is maintained through one 90-degree V-way at the back of the bed, the flat bearing at the front being 2 in. wide by 15 in. in length. The tailstock may be locked in any desired position by two clamping bolts located in front of the tailstock. The rear carriage bearing is 3 in. in width and the front bearing 6 in. in width; the carriage is gibbed longitudinally to the front bearing and the apron is cast integral with the carriage. The carriage is provided with a maximum longitudinal adjustment of 13 in., which is obtained by operating a hand-wheel. Each complete single turn of this wheel gives a longitudinal carriage movement of 1 in.

A single throw cam giving relief from zero to ¾ in. is carried by a cam slide swivel plate which is adjustable to any degree which is desired. Tapered gibs are provided for taking up wear on all slides. The forming tool may be quick-

the system to eliminate breakages. An adjustable collar on the splined shaft operates a knock off for stopping the movement of carriage.

The tailstock casting is of the extension barrel type providing clearance

high grade babbitt, while the bearings of the grinding wheel are of bronze, all wearing parts being of steel. Work holding vise is of spring type with steel guides and tension screws with lock nuts.

able scales on the eccentric allowing rapid adjustment. The proper combination of the various adjustments enables the grinding wheel to be so perfectly timed that when the wheel has traveled all the way down the face of the tooth, the cam comes into action and raises the wheel as it travels up over the back of the tooth.

The blade is positively fed through the machine by a double pawl positive feed movement, which continues feeding even where teeth are broken out of the blade. In actual work, fifty to sixty-five teeth per min. are finished, and one wheel will resharpen 200 to 300 blades, when taking an average cut on 18 in. blades. The belt driven machine as illustrated weighs 188 lbs., occupies a space of 22 in. x 24 in., and is built by the Wardwell Mfg. Co., Cleveland, O.

HEAVY DUTY MANUFACTURING LATHE.

over the carriage bridge when turning short work, and is clamped in position with four bolts. The spindle is fitted with a No. 5 Morse taper and is clamped by a plug binder which does not affect alignment.

The bed is capable of withstanding the most severe twisting strains as a result of being closely cross-ribbed with box type sections. It is made of semi-steel and has a large vee in front for guiding the carriage, while the headstock and tailstock are guided by the rear vee.

The standard length of bed is 8 ft.; swing over spindle, 21 in.; over vees, 11 in.; front spindle bearing, 5 in. x 9 in., rear, 4 in. x 8 in., distance between centres, 38 in.; cone pulleys, 14 in. and 17 in. dia. for 5-in. belt; tailstock spindle, 3½ in. dia. x 6 in. travel, and No. 5 Morse taper, five feeds per revolution, from .02 in. to .10 in.; net weight, 4,750 lbs.

The makers of this machine are the Himoff Machine Co., 128 Mott street, New York.

#### HACK SAW BLADE GRINDER

IT is now possible to effect considerable economy in the use of hack saw blades by re-sharpening them on specially designed grinding machines. The comparatively short life of hack saw blades and the inability to use them more than once imparts interest to the machine shown in the accompanying illustration, by means of which used blades may be used over again eight or ten times.

The machine is full automatic, blades of the same width and number of teeth per inch being fed through without stopping it or changing adjustments; the standard capacity ranges up to 36-in. long x 2 in. wide, with pitch as fine as 33 per in. The solid iron frame is in one piece. Main drive shaft runs on

Extending across the back of the machine is the main drive shaft from which a belt drive extends to the wheel shaft at the front end of a swinging arm, the rear end of which is supported between hardened steel pivots mounted in a segmental member. This allows the grinding wheelhead to be set at such an angle as to allow the edge or corner only of the grinding wheel to come in contact with the face of the tooth, and the opposite edge or corner on the back of the tooth; the wear on the wheel due to this arrangement keeps it always dressed to a knife edge. Two adjustments control the depth of the grinding and the amount ground off the back of the teeth.

The movement or feed of the blade is controlled by a slotted eccentric at the left of the machine, driven by worm gearing from the main drive shaft, suit-

LITTLE JIMMY came to Toronto from his Northern Ontario home where colored folks are hardly ever seen. One day when he was out walking with his Uncle Bob, there happened to pass a colored woman, and, as a result, the following conversation took place:—

"Say, Uncle, why did that woman black her face?" said Jimmy.

"Why, she hasn't blacked her face—that's her natural color," said Uncle.

"Is she black like that all over?" asked Jimmy.

"Why, yes."

"Gosh, Uncle, you know everything, don't you?"

The British Munition Co., Montreal, has let a contract to the Atlas Construction Co., Montreal, for the erection of an addition to its plant.

HACK SAW BLADE GRINDER.

### EXHIBITION OF ENEMY PRODUCTS AT TORONTO

**W**HILE it is meantime impossible to fully estimate results likely to accrue from the two-week period during which samples of enemy products were on exhibition in Toronto, there is little doubt that some useful missionary work has been done in the matter of directing the attention of our manufacturers to the value of export business, and in bringing vividly before them the wide variety of trade openings available in overseas markets. To what extent steps will be taken by Canadian industries to share in the different offerings remains to be seen, nevertheless in view of the intelligent interest aroused, and notwithstanding such immediate disabilities as high production cost comparatively, and lack of our own merchant marine, definite, even if slow and modest, progress may be expected. Not a few manufacturers visiting the Exhibition and who had been exercising themselves with regard to the possibilities of doing business in foreign markets expressed their intention of taking up the proposition seriously as a result of what they had seen. Others again were able to appropriate ideas from different exhibits which would help them to modify existing production methods, and thereby more effectually embrace home market opportunities, if not those abroad. Many samples of exhibits were loaned to manufacturers for further investigation.

The total attendance at the local Exhibition was 2,620, making the third highest in point of numbers of all the cities visited in the United Kingdom and Canada. The various attendances to date are as follows: Manchester, 3,491; Birmingham, 3,341; Toronto, 2,620; Glasgow, 2,014; Montreal, 1,714; Sheffield, 1,203; Dublin, 1,173; Leeds, 1,149; Liverpool, 1,079; and Nottingham, 1,050. Leicester and Bristol were both under the thousand mark. The attendance at Toronto included, of course, visitors from outside towns, such as Hamilton, Guelph, Kitchener, Galt, London, Peterborough, etc. In the totals of all of the cities named, the surrounding districts are of course also included. A circular entitled, "Questions for Canadian Manufacturers" was distributed at the Exhibition on behalf of the Department of Trade and Commerce, Ottawa, the response to which has so far been quite gratifying. A

considerable number of the circulars have already been filled in and returned to Ottawa for attention. A week's stay in London, Ont., commencing Nov. 20; followed by a like period in St. John, N.B., completes the programme so far as Canada is concerned. With the evidence before it that a display of exceedingly cheap, varied class and flimsy natured products merited a keen and widespread interest on the recent occasion, it behooves our Department of Trade and Commerce to immediately plan for an even larger display, and that of more substantial enemy products in the near future, bearing in mind particularly the lines through which Germany cemented her hold on our own home market.

### CANADIAN MUNITIONS OUTPUT BEING ACCELERATED

**A** RECENT statement issued by the Imperial Munitions Board expresses the view that our metal-working plants are exerting themselves to the fullest extent possible to meet the demand for both quantity and quality shell output irrespective of size and type. It is further of interest to note that not only are delivery dates called for on completed contracts several months removed from this period of writing, but to those firms showing special dispatch in performance, the largest slices of renewal orders have been promised. In the comparatively early stages of shell-making in Canada, we were understood to have "struck a stride" that would be hard to beat either by ourselves or our confreres in the industry. That we have got rid of that idea, our meantime capacity and accomplishment amply demonstrate, and this notwithstanding such disabilities as male labor shortage.

While the receipt and installation of the necessary manufacturing equipment is not now subject to what might be termed the almost interminable delays of the early stages, we are disposed to think that in many branches of the industry the "labor dilution"—the accession of female operators to the ranks of producers, is beginning to show a marked effect on the total output. It is the policy of the Munitions Board to develop this feature, which, in addition to its being at once a compensator and stimulator of recruiting for overseas service, is doubtless inspired by the all-round success of the "dilution" movement in Great Britain.

The hearty response which Canada has given to the financing of Britain's munitions orders is being reflected in the prodigality of the latter, and at least while the war lasts the reciprocal relationship may be expected to continue operative.

### IS A CANADIAN SHIPBUILDING COMBINE COMING?

**F**OLLOWING hard on the change of management of the Davie Shipbuilding & Repair Co., Levis, Que., comes advice that control of the Western Drydock & Shipbuilding Co., Port Arthur, Ont., has been secured by Canadian interests. In view of the foregoing we should not be surprised to find in the very near future other well-known plants of a like nature undergoing a change of personnel in their administration, and losing their identity except as to location in one gigantic merger. It is generally believed that the Canada Steamship Lines management are behind the movement towards a consolidation of the various interests. Such a programme will, we believe, contribute materially to both the development of our shipbuilding industry and the creation of a worth-while Canadian Merchant Marine.

## INDUSTRIAL NOTABILITIES

**T**HOMAS AHEARN, Electrical Engineer, Ottawa, Ont.; president, Ottawa Investment Co.; president Ottawa Land Association; president, Ottawa Car Mfg. Co.; president, Ottawa Gas Co.; president, Ottawa Electric Co.; president, Ottawa Light, Heat & Power Co.; president, Ottawa Electric Railway Co.; president, Ottawa Traction Co.; president, The Capital Mica Co.; director, Canadian Westinghouse Co.; director, Bell Telephone Co. of Canada; vice-president,

THOMAS AHEARN.

Ahearn & Soper, Ltd.; vice-president, The Wallace Realty Co. and the Ottawa Building Co., was born at Ottawa, June 24, 1855, son of John and Honora (Power) Ahearn. He was educated in the Public Schools, Ottawa. Originally a telegraph operator at Ottawa and New York, and later (1880) manager, Bell Telephone Co., Ottawa, he, in 1882, entered into partnership with W. Y. Soper under firm name of Ahearn & Soper, electrical engineers and contractors; some of the largest electric works in Canada have since been built and equipped by them.

Mr. Ahearn was one of the founders, Chaudiere Electric Light & Power Co. in 1886; this concern being merged in Ottawa Electric Co., 1895, and, with the Ottawa Gas Co., absorbed by the Ottawa Light, Heat & Power Co. He was also one of the founders and is president of the Ottawa Electric Railway Co., the pioneer venture of its kind in Canada. He is a member, American Institute of Electrical Engineers; Old Time Telegraphers and Pioneer Telephone Associations; Governor, St. Luke's Hospital, etc., etc. His clubs are: Rideau; Ottawa Golf; Ottawa Hunt; Ottawa Country and Laurentian; traveling is, however, his favorite pastime. His residence is "Buena Vista," Laurier Ave., Ottawa, Ont.

**Steel**

While steel prices in many lines are soaring beyond all previous records, it is anticipated that still higher figures will yet be attained. The feature of the market, and one that will have considerable bearing on early future prices, is the constant advance in basic and Bessemer pig, which have undergone a record rise in the past few weeks. In addition to abnormal conditions in pig iron, ferro-alloys are also advancing, a recent rise of \$2 per ton on ferro-silicon soon to become general. Pittsburgh quotations on billets and sheet bars have again advanced, and are now quoted at \$55, the rise for the week being \$5 and \$3 respectively. Even at these prices it is very difficult to place orders with the mills. Plates are still in great demand, car orders being quite heavy. Ship-building plates are also being contracted for the last half of next year. American sheet quotations are higher, Pittsburgh price on black being now \$4, and advance of \$5 per ton. A stronger market has also developed on galvanized, the current quotation of \$5.50 Pittsburgh, being an advance of ½c per pound. A general advance of \$3 per ton on wire products went into effect last week, the Pittsburgh prices now being: Plain wire, \$2.80; galvanized wire, \$3.50; wire nails, \$2.85; painted barb wire, \$3. and galvanized barb wire, \$3.70. Local dealers have not yet advanced prices, but may do so shortly. The coke market, which has been under great tension for some weeks, is showing slight signs of easing up, although prices are still high.

**Metals**

With the exception of copper, the general situation is unchanged. During the past week copper was subjected to a sharp advance, through scarcity of nearby metal. Tin is quiet, but very strong. Spelter has a stronger undertone. Lead is dull, but firm. Antimony is unsteady and easier. Aluminum is strong and unchanged.

**Copper.**—The nervous trend of the market, following the developments of the past week, is reflected in a sharp advance on price quotations. In addition to the apparent scarcity of nearby metal, the reported inquiry from British sources for considerable tonnage has temporarily upset the market, which under existing conditions, generally results in an advance of prices. While the situation is undoubtedly stronger, it is not anticipated that present prices will hold, and a partial return to those of a week ago is expected. Producers are booked far in advance, and are not taking an active part in making market quotations. London reports a strong market on advancing prices, electro having advanced £5 during the week. The result of the recent tension on the New

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

**Montreal, Que., Nov. 13, 1916.**—Industrial conditions are still featured by the continued advance of all classes of commodities, pig iron taking pride of place; and, as this may be taken as the foundation of the metal industries, it is evident that further advances in steel and steel products will follow in course. The output of munitions is constantly being increased; while plant extensions are also being made and equipment installed to handle the additional business offering. In some instances, shortage of raw materials is affecting production, and this may become more pronounced as the winter season develops, owing to the

shortage of cars and difficulties of transportation. The labor scarcity is not so pressing, although some of the plants in outlying districts are still seeking additional help.

**Pig Iron**

The outstanding feature of the present steel situation is the rapid advance in pig iron prices during the past few weeks. American quotations on foundry iron show an advance for the week of from \$1.50 to \$4 per ton. Bessemer has advanced \$2 per ton, and is now quoted at \$29.95 Pittsburgh. Composite pig iron is now \$25.135, being an advance on the week of \$2.825 per ton.

York market was an advance of  $1\frac{5}{8}$ c on lake, 3c on electrolytic, and  $1\frac{1}{2}$ c on castings; the nominal price being now  $30\frac{1}{4}$ c, 32c, and  $29\frac{1}{4}$ c respectively. Dealers here are quoting last week's prices; but anticipate an advance should strength be maintained abroad.

**Tin.**—The market is quiet, but very firm, with an undertone of early activity. The situation here is governed largely by conditions abroad, and the stronger British market is based on actual conditions and entirely free from speculation. With prices advancing, sellers are not seeking future business, but an early active buying movement is expected. The London advance to £185 is equivalent to approximately one cent per pound. New York is quoting  $43\frac{1}{4}$ c, an advance of  $1\frac{1}{2}$ c per pound. Local conditions are unchanged, the market being firm at 45c per pound.

**Spelter.**—The market is quiet, but developing a stronger tendency, with producers reluctant in making sales owing to the belief that prices will show further advances. London reports a stronger market, and New York quotations show an advance of  $\frac{5}{8}$ c per pound, the nominal quotation on prompt metal being  $11\frac{3}{8}$ c per pound. The market here is fairly active, the present quotation of 14c being one cent higher than last week.

**Lead.**—Despite the dullness that prevails at present, the market retains a firm position and prices are well maintained. Future inquiry is light, but producers are showing no anxiety, as they are well sold ahead. Even should the quiet spell continue, it is not expected that quotations would be easily effected. London and New York are both firm, with prices unchanged. Leading interests here report a steady market, with prices firm at 9c per pound.

**Antimony.**—With the market very quiet, an easier tendency is developing, but producers are inclined to think that the situation will show improvement in the near future, and are, therefore, inclined to refrain from forcing sales. New York prices are slightly easier; the quotation of  $13\frac{1}{8}$ c being a decline of  $\frac{1}{8}$ c per pound. The local market is unchanged, with prices steady at 15c per pound.

**Aluminum.**—The situation is unchanged, and the market is very firm. Prices are strong and well maintained. Dealers here are quoting 70c per pound.

#### Machine Tools and Supplies

Conditions throughout the machine tool industry are unchanged. The general demand is fair, particularly on single lots and specials. The abnormal cost of present equipment is a considerable deterrent to additional purchases, as users of machinery are just taking sufficient to meet their most urgent

needs. In some instances manufacturers are experiencing difficulty in obtaining enough help to keep the machines they now have operating continuously. Light standard tools are easily obtained, but indefinite delivery still features some of the heavier equipment. Supplies are still in heavy demand, and prices are high, with an advancing tendency.

#### Scrap

The upward tendency in raw materials is naturally affecting the scrap situation, and this market is, therefore, very strong, and higher quotations are becoming general. Heavy melting steel is in good demand, and prices here have advanced to 11c, which is one cent above last week. Rails show a similar advance, the present quotation being  $14\frac{3}{4}$ c per pound. American prices have advanced in many lines, and dealers here think the local market will soon respond.

#### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

**Toronto, Ont., Nov. 14.**—A statement recently issued by the Imperial Munitions Board indicates that there are enough orders for shells on hand to keep the munitions plants busy until the end of June, 1917. There will be no shortage of steel or other materials as the Board has made arrangements for the necessary supplies. The manufacture of component parts is now well established and smaller quantities of these parts will in future be purchased in the States. The situation in the munitions industry has improved considerably during the past few months and the output has increased materially.

#### Steel

Conditions in the steel trade show no improvement and the situation is gradually getting tighter, with no relief in sight. Although operating at full capacity the mills are still unable to take care of the heavy demand and deliveries are consequently getting further behind. With the munitions industry developing, output is increasing and the demand for steel for shells is proportionately greater. Prices are very firm and further advances on a number of steel products

may be looked for in the near future. Another advance on wrought pipe has been announced affecting both butt weld and lap weld, black and galvanized. Higher prices on bolts, screws, and rivets are expected owing to the high cost and scarcity of steel. Prices on boiler tubes are very firm and will doubtless advance shortly. Many makers are sold up on locomotive and merchant tubes for the first half of 1917, while on seamless steel tubing they are sold up for all of next year. Prices of boiler and ship plates are going up in the U.S. market and the demand for this material is as insistent as ever. A further advance on plates locally is therefore inevitable. The leading interest in the States has advanced prices on wire products \$3 per ton, so higher prices may be expected in this market.

Quite recently the American Sheet & Tin Plate Co., and also some independent mills, advanced prices on all grades of sheets \$2 to \$3 per ton. Practically all the more important mills have sold nearly their entire output for the first half of 1917. Under these conditions prices of black sheets will make a further advance. The output of sheets is heavy but is restricted somewhat by the shortage in steel and labor. The galvanized sheet market is much firmer due to the increase in cost of black sheets and also because of high spelter. Galvanized sheets will advance again.

An indication of the trend in the steel market is the report of the U.S. Steel Corporation which shows unfilled orders for the month ending Oct. 31, totalling 10,015,260 tons, an increase of 492,676 tons over the preceding month. The unfilled tonnage for October constitutes a record. The steel output of the United States in 1916 is already far in excess of any previous year, and the total for this year will probably be double that of four or five years ago. Even so, a serious scarcity of many important products exists now, and mills are refusing more business than they are accepting for some classes of steel.

#### Pig Iron

Pig iron prices are at the highest level of the last ten years, and indications point to further advances. A curious feature is the way in which the pig iron market has come forward after being comparatively quiet for over a year while steel prices were advancing. The pig iron market during the past two or three weeks has been a runaway affair. The cost of producing pig iron is increasing owing to the higher cost of iron ore, equivalent to \$2 a ton additional to the cost of pig iron. Labor costs and coke have advanced while supplies are also on a higher basis. Prices have again advanced in Buffalo. No. 2 found-

## WORLD'S PAPER AND PULP SUPPLY

INDICATIONS are not wanting that paper and pulp interests in Canada are well started on a campaign to make her after the war the chief source of the world's paper and pulp supply. We have been slow to take advantage of our large pulp wood and cheap and efficient water supplies, with the result that we now find ourselves many years behind the times in number of paper plants. However, in the last ten months the unusually large demand for newsprint has put new activity in the Canadian market, and new construction and additions are under way which will increase output by about 30 per cent.

By January 1, 1917, new machines put in operation will increase Canada's output by from 75 to 100 tons daily. Canadian production of newsprint is now a little less than one-half that of the United States, although it has an advantage in cost of manufacture of from 10 per cent. to 15 per cent. per ton, and a bulk of this production, or about one-fourth of the annual requirements of the United States, comes from Canada.

It is evidently the intention of Canadian paper and pulp makers to control the British market after the war, ousting both the German and Scandinavian interests, who have been foremost in British paper trade heretofore. German paper mills shipped thousands of tons of newsprint and other paper products to Britain before the war at prices well below the price of British mills, this being made possible by large combinations under government subsidy. The business between Germany and Great Britain after the war is not likely to be renewed, and the large profits now being realized by Canadian paper companies will place them in position to successfully carry on a campaign for export trade to Great Britain and her Colonies.

## DUTY ON SHIP MATERIALS

THE DOMINION GOVERNMENT has given Canadian shipbuilders permission to build ships for owners under neutral flags under certain safeguards. The Government has also passed an Order-in-Council relative to the duty on materials imported for building such ships.

This Order-in-Council passed a few days ago provides "that a drawback not exceeding 90% of the Customs duty paid may be made by the Minister of Customs on materials used in the original construction of ships and vessels measuring over 500 tons gross tonnage built in Canada, when such ships or vessels are authorized by Order-in-Council to be exported for registry outside Canada, or are British registered in Canada, and are constructed so as to obtain a

class in Lloyd's, Bureau Veritas, British Corporation, or other recognized classification satisfactory to the Minister of Customs, provided that the drawback payable under this section shall be in lieu of any drawback based on a specific rate per registered ton. "The claimant for the drawback must be the builder of the ship or vessel."

The payment of this duty, even where there was to be a drawback, meant that there would be a large amount of money tied up. The builders would still have been under the necessity of putting up this duty, which on a vessel of 8,000 tons would amount to about \$80,000. The Government would have held this till the vessel was completed, and would then have returned it. The Government has been induced to remove this obstacle by providing that this ninety-nine per cent. need not be paid into its hands where the construction takes place under the eye of a Government Customs officer in charge of the works. All liable articles are to be placed under the control of this official until they are embodied in the vessels.

## EMPLOYMENT BUREAU TO BE OPENED

PREMIER HEARST announced on Nov. 8, that the Provincial Government of Ontario through Dr. W. A. Riddell, its recently appointed Superintendent of the Trades and Labor branch is about to open a Public Employment Bureau in Toronto to meet the need of the Department of Labor of the Imperial Munitions Board, Mark H. Irish, the director has been studying the labor conditions in munitions plants, and has reached the conclusion that the increased output asked for by the Imperial authorities cannot be had except by a careful dilution of the male labor now employed. Moreover, although the supply of women labor at the moment greatly exceeds the demand, the munitions manufacturers are willing to provide the requisite accommodation for women wherever the work they are doing can be done by women. It is, therefore, expected that within the next three or four months many more women will be employed making munitions than at present.

The bureau about to be opened in Toronto and others which may be opened, while intended in particular to assist in the special work above referred to, will act also as general employment bureau, and thus help to some extent to meet the present abnormal labor conditions. The present step is an indication of the willingness of the Government to meet the emergency now existing without waiting for the development of a complete provincial system of employment bureau.

## CANADA'S OCTOBER TRADE

THE Dominion revenue for October totalled \$18,158,128, an increase of \$3,717,795 over October of last year. The increase in customs revenue, due to continued increase in imports, accounts for the growing revenue from taxation. Although expenditure for the month on current account amounted to only \$7,803,405, a decrease of \$2,272,576 as compared with the preceding October, the cost of war jumped to nearly twenty-three millions for the month, and the debt increase amounted to \$15,503,713. Canada's national debt is now just four millions under the seven hundred million mark, and in the past twelve months has been \$203,000,000.

The cost of war for the first seven months of the current fiscal year has been \$127,487,147, or more than eighteen millions per month, to say nothing of expenditure incurred by the War Office on Canadian account and left until after the war to be entered up.

For the seven months, revenue has been \$121,747,808, an increase of \$34,063,960, as compared with the corresponding seven months of last year. The Consolidated Fund expenditure has been \$57,561,116, an increase of \$1,213,513 in ordinary expenses of administration.

## GERMAN SLIMNESS

THE following example of German slimness furnished by a correspondent of a British contemporary from his own personal knowledge is interesting because of the light it sheds on German business methods and enterprise:—A German traveler working for a British firm secured orders beyond the output of the factory, with the result that the firm could only deliver part of requirements of their customers. Having a list of the customers and a knowledge of the demand, he went for a holiday to his own country, and, on the evidence at his disposal, obtained the necessary funds to erect and equip works for the production of the same articles on a larger and more economical scale than the British firm. The arrangement was made with a German bank, the new works being under its control until the outlay was recovered. He retired from the British firm as soon as he was in a position to enter into competition with them, which he did with remarkable success. Had the British firm been in a position to raise funds in order to increase its works and output more speedily, and had it suspected the duplicity of its traveller, it might have developed an important and thriving industry; but as the next move of the German was to secure control of the supplies of raw material for the production of the articles in question, the industry in Britain speedily declined.

# Davenport 22-Inch Lathe — For Extra Heavy Service

These lathes are built exceptionally rigid and heavy. No feature has been omitted, to secure great strength and power. The bed, the headstock, the tailstock, the carriage—every detail has been designed and constructed with a view to driving the heaviest cut that any tool will stand up against. At present we can make quick deliveries on this machine.

Built with ordinary change gears unless otherwise specified.

Write at once for Bulletin. It gives full details of construction.

**DAVENPORT LOCOMOTIVE WORKS**  
DAVENPORT, IOWA

Length of Bed, 8', 10', 12', 14'.

Vancouver and St. John, N.B.

## SELECT YOURS

Or let us select it for you.

Let us know the line of thread-cutting you have to do, and we will send you full particulars of the Die Head best suited.

Geometric Self-opening Die Heads that release the work when the required length is reached, are furnished for cutting from 1/16-in. diameter up to the largest requirement, of any pitch and form. Can be arranged for any make of Screw Machine.

The big manufacturers are using them, and the smaller manufacturers cannot afford to do their thread cutting without them.

**The Geometric Tool Company,**  
New Haven, Conn., U.S.A.

### DOMINION FOREIGN TRADE INCREASE

CANADA'S foreign trade has reached very high figures in bulk, but still higher when viewed from a per capita standpoint. In July the value of the exports was equal to \$28 per head, as compared with an average of about \$11.50 for four years preceding March 31, 1914. This extraordinary result is due to the fact that Canada has resources for which the war has created very extraordinary demands. Take for instance, the one item of copper. In 1913 the value of the exported product was \$9,911,000, which before 1916 was the record year. For the twelve months ending March last the value of the exported product was \$14,670,000. It is true that the price of copper was very much higher in the latter than in the former year, but the increase did not account for the larger aggregate value. The quantity of copper exported increased from 83 millions in 1913 to 111 millions in 1916. Nickel exported in 1916 was valued at \$7,714,000, as compared with a little more than five millions in any previous year.

Other fundamental necessities of which war in Europe created a shortage, such as wheat, flour, and other manufactured products, were sent out of the country in very much greater volume than at any previous time. When, therefore, we look into the kind of goods that we have during the past two years sent out of the country it will be found that they are derived from domestic resources. Trade, however, embraces both what we buy and what we sell. Purchases quite recently have been on a slightly higher scale than normal in, say, the last ten years, but not so much as to be a factor in sending up to very high limits the per capita trade. In the last fiscal year our total exports of merchandise amounted to \$780,000,000, as compared with a previous high record of \$461,000,000. On the other hand, our total imports of merchandise in 1916 was 508 millions, as compared with 670 millions in 1913. It cannot be charged, therefore, that our trade is very largely affected by excessive purchases abroad for the purpose of re-export. Increased volume of trade is due to larger demands made upon Canada for things made by domestic labor out of native raw material.

The great rise in our exports dates from the time the phenomenal crop of 1915 began to find its way to the markets of the world. About the same time the steel and other manufacturing plants in the Dominion began to turn out war material in larger quantities. As in Britain and elsewhere delay occurred in answering the urgent call for shells and guns. Men and plants were not equipped for making munitions of war, and in consequence there had to be done much experimenting, which took time and involved risk and capital. After

the experimental stage had been passed and accuracy of specification and product had been obtained, the volume of output increased very decidedly. In 1914 the monthly exports of manufactured goods averaged \$5,700,000; in 1915, \$12,600,000, and in the first six months of the present calendar year, \$34,000,000.

Until the war ends the volume of manufactured goods exported will in all probability be maintained. There are, however, bankers and others who hold the belief that before many months are over the Allies will be manufacturing most of the ammunition they require nearer to the scene of operations, which would effect economy in transportation and in such efficiency, as greater concentration of effort would give. If such developments do arise it will have a tendency to decrease the volume of manufactured goods sent from Canada. There is no possibility, however, of the demand for our food products, our copper, nickel, coal and steel falling off so long as the war lasts, and for an indefinite period following the war, hence we may look for continued high levels in the volume of our exports.

### NEED ASSISTANCE OF MANUFACTURERS

THAT the Department of Trade and Commerce cannot make the proposed Dominion Trade Conference a success without the hearty co-operation of the manufacturers of the Dominion, was the recent statement of Sir George E. Foster, in reply to a question about the future of the conference.

He stated that the meeting will be called as soon as preparations which are essential to its success shall have been completed.

"It was never intended to be a talking exhibition, but rather a conference attended by representatives of every great industry to discuss conditions when peace comes, and to determine what can be done to aid each individual industry.

"It will strive for co-operation and team work among all productive industries; the transport and financial equipment of the country. This, it will be observed, necessitates a great deal of spade work which is now being carried on. It is not to be expected that any department can do this work of itself. It must be undertaken heartily and thoroughly by the great interests themselves. They have the practical experience and the knowledge.

"The call to action which I issued sets that forth very clearly. I may say, however, that indications are being daily revealed showing that the business and productive interests of Canada are more or less alive to the situation, and are disposed to give it thought and attention."

### TRAINING MUNITIONS INSPECTORS

THE suggestion of Col. Guthrie from Ottawa to consult with the principals of the Toronto and Montreal Technical Schools have developed into something more than was at first thought. The plan of the Imperial Munitions Board is not, as at first thought, to merely establish training classes for returned soldiers in munition making, but classes for those who are already holding the positions of inspectors.

At the present time, of course, there are classes for men and women, but these will be of a much more technical nature, and further advanced as they are a "finishing school" for those who have been acting as inspectors. Two experts from England are being brought out by the Imperial Munitions Board, and they will instruct.

The two centres for these instructions are Toronto and Montreal. The classes will start at first with twenty or so students. Then, as soon as they have qualified they will turn out and teach others.

Two large rooms and a smaller one with a blackboard are in readiness at the Toronto Technical School now, so that there is not likely to be any delay at that centre at least. In all likelihood the Board of Education will grant the use of the rooms gratis in return for the supply of teachers and materials by the Munitions Board. These classes are to start at once.

### SHELL ORDERS ENOUGH TO LAST UNTIL JULY, 1917

ACCORDING to a statement made by the Imperial Munitions Board the Canadian manufacturing concerns who are at work on munitions will be kept busy on the basis of present orders in hand until June 30 next. Some orders expire on December 31, and others on March 31. Firms which make the best record in the matter of deliveries are likely to receive the biggest share of the renewed orders.

All necessary raw materials to maintain the deliveries required are contracted for well ahead, and the Board is in a good position in regard to the necessary supply of steel. No uneasiness is caused by the reported shortage in the States, because the Board made large purchases of steel during the spring and summer months. The policy adopted some time ago whereby Canadian manufacturers would supply fuses, primers, brass discs, cartridge cases, and other component parts of shells is now well established, and smaller quantities of these supplies are being received from the United States. Many of these parts will in future be secured extensively in Canada.

The Board states that the Canadian manufacturers are doing their best to carry out the manufacture of shells with the greatest possible expedition.

# Aikenhead's DUMORE GRINDER

The DUMORE Portable Grinder. The only small grinder giving wheels the correct surface speed.  
Speed. 30,000 R. P. M.

**Weights only 17 pounds**

# INDUSTRIAL <sup>A</sup><sub>N</sub>D CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**Leamington, Ont.**—John A. Campbell is in the market for a 50 to 100-h.p. gas engine.

**St. Catharines, Ont.**—The Metal Drawing Co., will build a foundry at their plant here.

**Montreal, Que.**—The Canada Stove Co., will build an extension to their factory at St. Laurent near here.

**Toronto, Ont.**—W. H. Banfield & Sons will extend their factory on Pape Avenue, at a cost of about \$10,000.

**Toronto, Ont.**—The Hamilton Gear & Machine Co. has commenced the erection of an addition to its plant to cost \$7,500.

**Galt, Ont.**—The Perfect Machinery Co. has commenced the erection of a foundry. It will be L-shape, 24 x 60 ft., and 20 x 26 ft., of concrete and brick.

**New Glasgow, N.S.**—The Steel Furnishing Co. is in the market for three turret lathes, suitable for steel sockets and three millers suitable for milling outside thread of sockets.

**Shelburne, N.S.**—Owing to the development in the shipbuilding industry here and demand for marine oil engines, it is proposed to establish a plant for making gasoline engines.

**Deseronto, Ont.**—Work is being rushed as fast as possible on the new building of the Dominion Hardwoods, Ltd., here. The Dominion Bridge Co. are erecting the overhead steel work of the engine and boiler-rooms.

**Ingersoll, Ont.**—That a large plant for the manufacture of automobile tires will be located here was announced the other day. The proposed plant, when equipped will it is stated, cost about \$200,000. The company will have a capitalization of \$1,000,000.

**The International Nickel Co.** has completed the survey for its refinery at Port Colborne, Ont., and begun excavation work with a view to having the foundation completed before the winter sets in. If this is accomplished, it is expected that the plant will be in operation within a year. It will be built in units so that it can be quadrupled in capacity should it be found necessary. The first unit will employ 300 men. A number of new technical processes will be intro-

duced. The company has set aside \$5,000,000 to cover the cost.

**Niagara Falls, Ont.**—Sir Adam Beck announced recently that the right of way for the canal to be constructed between Lake Erie and the Niagara Gorge to create a new fall at which power will be generated under the scheme known as the Chippawa development, has been acquired, and that work will be undertaken as early as possible next spring. The contracts will be let during the winter.

**South Vancouver, B.C.**—As a result of action decided upon by the City Council, it is more than probable that two important new industries will be established in the municipality in the near future. The larger of the two industries will be a rolling mill to cost \$150,000, capable of turning out 30 tons of steel per day, promoted by David Milne, a Victoria capitalist, and G. R. Kennedy of Medicine Hat; and the other the Dominion Glazed Pipe Co., at present established on Front Street, and seeking a site suitable for the expansion of its business, which the company is confident will soon take place.

## Municipal

**Sault Ste. Marie, Ont.**—The Town Council propose installing two centrifugal pumps, each having a capacity of five million gallons.

**Owen Sound, Ont.**—A by-law is contemplated to raise \$15,000 by way of a loan to the Keenan Woodenware Co., to enable them to enlarge their business to include the manufacture of refrigerators.

**New Toronto, Ont.**—A by-law will be submitted to the ratepayers on Nov. 25 to raise \$15,000 for the purpose of installing an incinerator or garbage disposal plant, and purchasing a site therefor. George D. Scott, Village Clerk.

**Ford, Ont.**—The Town Council contemplate installing a new sewage system at a cost of \$113,915. A by-law will be submitted to the ratepayers in January. Aird, Murray & Lowes, of Toronto, who are the engineers, have prepared plans for the new system.

**Bracebridge, Ont.**—A by-law will be voted on by the ratepayers, guaranteeing bonds of the Beacon Match Co., to

the extent of \$15,000 and granting the company fixed assessment for ten years.

**Whitby, Ont.**—On Dec. 4 the ratepayers will vote on a by-law to raise \$100,000 as a guarantee of bonds for a new tractor industry to be established by certain American interests.

**North Bay, Ont.**—Two industrial by-laws will be submitted to the ratepayers for their verdict on December 11. The North Bay Toy Co. are asking the town for a free site and building, the cost not to exceed \$15,000, and the Dominion Rubber Cloak Co., of Toronto, are asking for a bonus of \$5,000 and a loan of \$15,000 in order to establish a business here.

## General Industrial

**Toronto, Ont.**—The Ideal Bread Co. will erect an additional storey to their factory on Dovecourt Road at a cost of \$15,000.

**Guelph, Ont.**—The Munder Tungsten Lamp Co. will build an addition to their factory, to cost about \$12,000.

**Kitchener, Ont.**—The Consolidated Felt Co. will build an extension to their factory, to cost about \$20,000.

**Barrie, Ont.**—Fire on November 6 damaged the Barrie Carriage Co. factory. The loss is estimated at \$3,000.

**Owen Sound, Ont.**—Fire, which damaged the kiln section of the Owen Sound Fruit Co. evaporator plant here on Nov. 6, was caused by an overheated furnace. The loss will amount to about \$700, with no insurance.

## Contracts Awarded

**Brantford, Ont.**—P. H. Secord & Sons have been awarded a contract for a \$15,000 addition to the Galt Brass Works.

**New Toronto, Ont.**—The general contract for the erection of an incinerator for the Town Council has been let to Reed Products Co., Toronto. Approximate cost, \$10,000.

**Toronto, Ont.**—The Hydro-Electric Commission has awarded a contract to the Canadian Bridge Co. for 1,000 tons of steel for towers on the Toronto-Dundas line, this amounting to over \$100,000. The Commission is also giving a contract for \$40,000 to \$50,000 on the Etobicoke Station.

## New Incorporations

The **Brampton Pulp & Paper Co.** have been incorporated at Ottawa with a capital of \$9,000,000 to carry on a pulp and paper business with head office at Montreal. Incorporators are Errol Languedoc, Ralph E. Allan and William Taylor, all of Montreal.

The **Bermuda Bunkering Co.** has been incorporated at Ottawa with a capital of \$30,000 to deal in coal and operate ships and docks, with head office at Toronto. Incorporators W. W. Perry, Kenneth McKenzie and Charles H. C. Leggatt, all of Toronto.

**Dominion Porcelain Corporation** has been incorporated at Ottawa with a capital of \$150,000 to manufacture porcelain and clay products of all kinds at Preston, Ont. The incorporators are Gideon Grant, Mervil MacDonald and Bruce Williams, all of Toronto.

**Eclipse Plating & Sales Co.** has been incorporated at Ottawa with a capital of \$50,000 to carry on business of electroplaters and manufacturers of electrical supplies at Ottawa, Ont. Incorporators are John Dorning, Philip M. Grimes and F. D. Hogg, all of Ottawa.

**Dominion Boiler & Foundry Ltd.** has been incorporated at Ottawa with a capital of \$200,000 to manufacture boilers and furnaces of all kinds at Montreal East, Que. Incorporators are Charles W. Webb, J. H. Charbonneau and Victor Pelletier, all of Montreal.

The **Packard Fuse Co.** has been incorporated at Toronto with a capital of \$200,000, to manufacture machinery, tools and munitions at St. Catharines, Ont. Incorporators, Ralph B. Hamilton, George C. Rough and Francis T. Wyman, all of St. Catharines.

The **Samara Pulp Co.** has been incorporated at Ottawa with a capital of \$25,000 to manufacture pulp and pulp products of all kinds. The head office is at Montreal and the incorporators are Arthur R. Holden, Pierre A. Badeaux and Ernest G. Bennett, all of Montreal.

The **Hamilton Steel Wheel Co.** has been incorporated at Ottawa with a capital of \$2,000,000 to manufacture steel wheels for railway carriages and locomotives, etc., at Hamilton, Ont. The incorporators are John R. Marshall, George A. Young and A. H. Johnson, all of Hamilton.

The **Dodge Manufacturing Co.** has been incorporated at Ottawa with a capital of \$500,000 to engage in the business of engineers, founders, and a general engineering business by taking over the business of the Dodge Manufacturing Co., Toronto. The incorporators are Charles F.

## Screw Machine Queries:

### WHY SIX SPINDLES?

**R**ATHER ASK — "why not six spindles?" — as the greater number of spindles in the "New Britain" Automatic does not materially add complexity.

For some jobs, essentially simple in character, this number of spindles may seem unnecessarily great—until it is considered that in most cases the full spindle capacity of the machine may be taken advantage of by subdivision of the longer operations, the net results being greater production per machine and lower cost per piece.

The saving in rehandling of pieces requiring a variety of operations beyond the capacity of a four-spindle machine is of obvious advantage. Moreover, some work which may be undertaken on a four-spindle machine can be handled by the "New Britain" Six-Spindle Automatic in a much simpler manner, without complicated set-up and excessive attention.

*Are you not rehandling some pieces which a "New Britain" would finish complete? An investigation might prove profitable.*

James Shand, all of Toronto.

The Dominion Thresher Co. has been  
incorporated at Toronto with a capital of  
\$40,000 to manufacture agricultural ma-  
chinery and traction engines at New  
Hamburg, Ont. Incorporators, T. W.  
Kingswood, and William A. Bailey, of  
London, Ont., also William R. Miller, of  
Hamilton, Ont.

## Personal

C. H. Withers has been appointed  
manager of the Escher Wyss Co. head  
Canadian office at 12 Coristine Building,  
Montreal.

Col. Thomas Cantley, president of the  
Nova Scotia Steel & Coal Co., expects  
to sail this week for the Old Country on  
a business trip.

Arthur H. Chadwick, director and  
manager of the Canadian Chadwick  
Metal Co., of Hamilton, Ont., died on  
November 8, aged 50.

F. B. Zercher, of Montreal, has been  
appointed master car builder, G. T. R.  
Western Lines. Mr. Zercher, who suc-  
ceeds A. Copony, resigned, is well known  
in railway circles in Eastern Canada. He  
will make his headquarters at Elsdon,  
Chicago. The appointment dates from  
November 1.

Norman S. Thrasher, purchasing agent  
of the Wellman-Seaver-Morgan Co.,  
Cleveland, O., has accepted the position  
of purchasing agent of the Western Dry  
Dock & Shipbuilding Co., Port Arthur,  
Ont. Mr. Thrasher was formerly pur-  
chasing agent of the American Ship  
Building Co., Cleveland, O.

James Chase Wallace, former presi-  
dent of the American Ship Building Co.,  
died on Oct. 31, at his home, in Lake-  
wood, O., after an illness extending over  
several months. Mr. Wallace was born  
May 23, 1865, a son of the late Robert  
Wallace, who was one of Cleveland's pio-  
neer ship builders. The younger Wal-  
lace followed in his father's footsteps  
and devoted his life to the building and  
operating of ships. With his father he  
organized the Cleveland Ship Building  
Co., and afterward effected the organi-  
zation of the American Ship Building  
Co. Mr. Wallace began his business car-  
eer in 1881 by starting his three years'  
service as a machinist. When the Cleve-  
land Ship Building Co. was formed in  
1887, he was placed in charge of the  
drafting room. In 1890 he was named  
assistant superintendent of the company  
and in 1893 he was chosen vice-president  
and general manager. When the Amer-  
ican Ship Building Co. was formed in  
1899, it taking over the plant of the  
Cleveland Ship Building Co., Mr. Wal-  
lace was named vice-president and gen-

eral manager of the new concern. This  
position he held until early in October,  
1904, when he was chosen president of  
the American Ship Building Co., in suc-  
cession to A. B. Wolvin. He retained  
the presidency until Sept. 23, 1914, when  
Edward Smith, since deceased, was  
elected.

## Trade Gossip

The Shawinigan Electro Metals Co. has  
increased its capital stock to \$1,000,000.

The Dominion Copper Products Co., of  
Montreal, have taken over the old tin-  
plate mill at Morrisburg, Ont., and will  
start operations in about six weeks. The  
mill has been lying idle for some years.

U.S. Steel Orders.—Unfilled orders of  
the U.S. Steel Corporation for the  
month ending Oct. 31 last were 10,015,260  
tons, breaking all previous records. The  
figures showed an increase of 492,676  
over those of the preceding month.

The British American Nickel Co. is  
making preparations for the erection of  
a refinery, probably in the Sudbury,  
Ont., district. The company has secured  
E. P. Matheson as general manager. E.  
R. Wood and James P. Dunn, London,  
Ont., are interested in the company.

The Carter Welding Co., of Toronto  
have removed their office, works and  
demonstration plant from 561 King  
street, West to 9 and 11 Sheppard  
Street. The company have installed a  
modern and well-equipped welding and  
cutting plant.

The Exhibition of Enemy Samples,  
which closed recently in Toronto, will  
open in London, Ont., on Monday, Nov.  
20, and close on Saturday, Nov. 25. H.  
Kershaw will be in charge, and his ad-  
dress during the exhibition period will  
be care the Secretary Board of Trade,  
London, Ont.

A. B. Roberts, 727 Traders Bank  
Bldg., Toronto, has secured the agency  
for the Cement Gun Co., and will handle  
their product throughout Canada, ex-  
cept in the provinces of British Colum-  
bia and Alberta. Mr. Roberts is also  
sales representative of the Chapman  
Valve Mfg. Co., Indian Orchard, Mass.

Ore Shipments Large.—More than  
eleven million tons of iron ore have been  
shipped from the docks of the five com-  
panies at the American head of the lakes  
during the season up to November 1 than  
during the corresponding period last  
year. Up to November 1, last year, 29,-  
345,174 tons were shipped, while during  
the same period of 1916, 40,608,767 tons  
have gone forward.

Port Arthur, Ont.—James Whalen, of  
Port Arthur, and John Burnham, of Chi-  
cago, by an investment of \$1,500,000

have secured exclusive control of the Western Dry Dock & Shipbuilding Co. plant here. They have contracts for several boats, also assurances that the plant can be kept going at full capacity for a long time to come. They expect to turn out twelve boats in 1917.

**Machine Tool Equipment Aboard Ship.**—The value of the machine tool and repair equipment on the United States repair ship Prometheus is said to be nearly \$80,000. There are over fifty machine tools, including lathes up to 72-in. swing, vertical boring mill with table 6 ft. diameter, a radial drill of 48-in. capacity, and other tools, all of which are driven individually by electric motors.

**Australian Ships Load at Montreal.**—The Australian Government, according to a report to the Trade and Commerce Department, Ottawa, has now in its service a fleet of 35 cargo steamers, some of which have already loaded at Montreal for Australian ports. In addition, five large sailing ships are being operated under Government control. The earnings of these ships are said to be satisfactory. The vessels will be overhauled in Australia and used in the transportation of wheat and other commodities.

**Francis Hankin & Co., Montreal,** have been awarded a contract for water meters by the city of Montreal, valued at \$25,702. The meters range in sizes from 2 in. to 8 in., and will be placed in lines supplying the harbor front fire protection system. The fire hydrants in the system are all connected beyond the meters and it was therefore essential that a minimum loss of pressure should be caused through the meters. This British-made meter known as the "Helix," showed a loss of about 4¾ lbs. only and this feature decided the contract in its favor.

**Rubber Trade Control.**—Great Britain controls the rubber production of the world to-day. In 1893 she laid the foundation for it by encouraging rubber plantations in Ceylon, Sumatra, the Malay States and Java. Brazil then produced the world's supply, but to-day Britain's fostered plantations dominate the output, and the British Government say when and where rubber shall go. Thus, Germany is prevented from obtaining any, as none can enter neutral countries except with the consent of the British Consul in that country. Incidentally, Great Britain's control of the rubber market has reduced the price from three dollars a pound to about 67 cents, and rubber has been placed within the grasp of all.

**Hudson Bay Railway.**—The Hudson Bay line will be finished in 1917, according to the contractors; but recent

## Saving or Wasting?

The manner in which you handle the drinking water problem in your plant may seem to be a small matter to you—but investigate. The results will be surprising.

The old-time faucet is costly. Running hour after hour, day after day, its ceaseless flow is costing you money, yet without any better service.

## Puro Saves 35%

A Puro Sanitary Drinking Fountain will cut that water bill 35%. We can prove that it has done that for others.

It will give every employee a safe, saner draught of bubbling water free from the contamination of the common drinking cup.

In a word, it is the only sanitary Drinking Fountain that is really safe, sanitary, simple, automatic in control, and easy to attach.

## QUANTITY PRODUCER

This tool is used in shops  
where parts are keyseated  
by thousands. It is fitted  
with a high-speed steel  
rotary cutter for milling in-  
ternal keyseats in one cut.  
Shops large and small can  
use the tool, and it is read-  
ily attached to a drilling  
machine for which it is de-  
signed. The tool keyseats  
in places where Keyseating  
Machine, Planer and Shaper  
can't reach. The right tool  
to use for keyseating inter-  
changeable parts. There is  
no limit to the variety of  
work possible to be key-  
seated.

NATIONAL MACHINE TOOL CO.

Co., Ltd., Montreal, St. John, Toronto,  
Winnipeg, Calgary, Vancouver, Ottawa,  
Quebec, Hamilton, Saskatoon and Vic-  
toria.

investigations, insisting that the Straits  
are only open about two months in the  
year, are calculated to dampen the  
ardor of those who claimed that the  
Straits were navigable for four or five  
months. Even the two months, always  
show, it is stated, floating bergs, which  
would render navigation difficult, and  
compel the building of a special kind  
of boat to resist the onslaught of float-  
ing bergs. The prospect is not too en-  
couraging; but the line is to be finished,  
in any case. About 90 miles of track  
have been laid this past season. Labor  
has been scarce, which accounts for the  
rather slight record of work.

**Russia's Iron and Steel Output.**—  
Russia's production of pig iron, semi-  
finished and finished steel in the last  
two years, according to *L'Economiste  
Européen* of Sept. 29, 1916, was as fol-  
lows in net tons:—

	1914.	1915
Pig iron .....	4,769,300	4,062,100
Semi-finished steel	5,308,800	4,539,100
Finished steel ..	4,334,100	3,599,500

Central Russia is credited with over  
70 per cent. of the total pig-iron output,  
the Ural region coming second. Central  
Russia also leads in semi-finished and  
finished steel, making 60 per cent. of the  
total semi-finished steel, while the Ural  
region made 20 per cent. In 1914 Po-  
land produced 269,500 tons of pig iron,  
389,900 tons of semi-finished steel and  
313,000 tons of finished steel.

## Tenders

**Weir, Que.**—Tenders for furnishing all  
labor and materials and constructing a  
steel bridge and appurtenances to be  
erected over the Rouge River (Riving-  
ton Bridge), addressed to the under-  
signed, will be received by the Municipal  
Council of Harrington until December 2,  
1916. All tenders shall be in accordance  
with the plans and the specifications pre-  
pared by the engineer of the Depart-  
ment of Public Works and Labor, and  
which may be seen at the office of the  
undersigned. Pierre Cantin, treasurer,  
P.O. Box 44, Weir, Que.

## Marine

**Vancouver, B.C.**—It is reported to be  
not improbable that in the near future  
a shipbuilding yard on a somewhat ex-  
tensive scale will be laid down on the  
south side of False Creek, Vancouver.  
Already plans have been drawn, and it  
is anticipated that a start will be made  
just as soon as these can be put into  
shape and a sufficient number of work-  
men engaged to go ahead. The firm  
interested in the scheme is that of

Messrs. John Coughlan & Sons, the  
well-known steel manufacturers who  
have a big steel plant on Beatty Street,  
Vancouver.

**St. John, N.B.**—Arrangements are be-  
ing perfected to care for a much larger  
business the coming winter than last.  
The Government Railway has promised  
to add to the trackage on the harbor  
front, and it has also contracted for the  
deepening of available berths. Among  
the steamship enterprises suggested has  
been that of a 25-knot an hour all Brit-  
ish steamer service to cross the Atlantic  
in three and a half days from a port on  
the west coast of Ireland to St. John or  
other maritime port. This suggestion  
has been made to the Dominion's Royal  
Commission by the representatives of an  
English shipbuilding firm.

## Refrigeration

**Toronto, Ont.**—Gunns, Ltd., are build-  
ing an extension to their abattoir to cost  
\$3,500.

**Toronto, Ont.**—The William Davies  
Co. have been granted a permit for a  
cold storage building at Front and  
Cypress Streets, to cost \$100,000.

## Wood-Working

**Lachute, Que.**—Fire recently destroy-  
ed the E. Charboneau & Co. sash and  
door factory. The loss is estimated at  
\$15,000.

## Railways—Bridges

**Ottawa, Ont.**—Notice has been given  
of an application to Parliament for a  
charter to the Peace River, Mackenzie  
and Copper Mine River Railway Co. of  
Canada to extend from Sawbridge, on  
the Edmonton, Dunvegan and British  
Columbia Railway to Bells Rock, on the  
Great Slave River.

## Building Notes

**Hamilton, Ont.**—The Canadian West-  
inghouse Co. propose erecting a new of-  
fice building next year.

**Galt, Ont.**—Drs. W. S. McKay and  
W. S. Dakin will build a three-storey  
store and office building on Water Street  
at an estimated cost of \$15,000.

**Hamilton, Ont.**—The two new wings  
to be added by the Military Hospitals  
Commission to Hamilton's new sani-  
tarium on the mountain will be of slow  
burning construction, costing \$50,000.

## Catalogues

**Belt Sewing Machine**—Bulletin illustrating and describing a wire belt sewing machine made by Joseph Appleyard, Bradford, Yorks, England. Each type of machine for sewing various sizes of belts is illustrated and described, the principal dimensions and shipping weight being given for each size. One page contains a number of illustrations showing the different classes and thicknesses of machine belting which these machines will sew. A large number of testimonials are included from users in various parts of the world.

**Lagonda Boiler Tube Cleaners** is the title of a very attractive catalogue L-9, just off the press, issued by the Lagonda Mfg. Co., Springfield, Ohio. The catalogue comprises 36 pages illustrating and describing the different sizes and types of "Lagonda" boiler tube cleaners for removing various kinds of boiler scale from all sizes and types of tubes. Several pages are devoted to cleaners for special uses such as economizers, evaporators, condenser tubes etc. The catalogue also deals with other boiler room specialties such as multiple strainers, grease extractors, automatic cut-off valves, automatic lubricators, and reseating machines. A comprehensive description is given of each specialty accompanied by illustrations. A complete list of tube cleaner repair parts, is included with illustrations. A copy of this catalogue will be gladly sent to any engineer interested, upon request.

**Nonpareil High Pressure** covering for heated surfaces is the title of an interesting and attractive publication recently issued by the Armstrong Cork Co., Pittsburgh, Pa. The booklet contains 84 pages and deals fully with the subject of insulation for high pressure and superheated steam lines, boilers, breechings, feed water heaters, etc. An interesting feature is a list of comparative tests made at the company's Beaver Falls factory, as a result of which they have been able to fix definitely the heat losses from various sizes of pipe both covered and uncovered. These losses are given in B.T.U. per lineal foot, per degree difference in temperature for twenty-four hours and are tabulated. In the following pages are tables which show in a general way, the most economical thickness of "Nonpareil" high pressure covering to use, based on different steam costs. A complete set of specifications is also included dealing with the correct installation of these various thicknesses of covering. The booklet is fully illustrated and is exceptionally well gotten up. It contains a great deal of interesting and useful information. Copies may be had on request by interesting readers.

Foundry Co., Alton, Ont. (22)

**6½ H.P. WESTINGHOUSE AND 1/3 H.P.**  
Toronto & Hamilton Electric Co. 60-cycle  
motors, in first-class order. Geo. H. Lees &  
Co., Hamilton. (17)

**FOR IMMEDIATE SALE, TORONTO—3,000**  
feet seamless steel tubing, 1½" O.D. by  
5-32" wall. No reasonable offer refused. Box  
227, Canadian Machinery. (15)

**FOR SALE—TWO C.M.C. TURRETS—SPE-**  
cially built for inside boring for 6"  
shells; almost new. These are offered for  
sale subject to special terms as to delivery,  
and at price to be arranged. Taylor-Forbes  
Co., Ltd., Guelph. (19)

**ONE REED TURRET LATHE, 8' BED,**  
swing, 28"; 4 2" holes in turret. This ma-  
chine is in first-class condition and was only  
used on 3,000 shells. Is a very powerfully  
built machine and will bear fullest investiga-  
tion. Box 241, Canadian Machinery.

**FOR SALE — HOT SAW AND MILLING**  
machine, Ajax. New; never used. Address  
Canadian Warren Axe & Tool Co., St. Cathar-  
ines, Ont.

**FOR SALE—45 H.P. GAS PRODUCER AND**  
engine, complete. Good condition. For  
particulars write Canadian Warren Axe &  
Tool Co., Ltd., St. Catharines, Ont.

**FOR SALE — STEEL WATER TOWER,**  
without tank, 94 feet high. Will support tank  
holding 13,000 gallons. Cost new \$1,600.00.  
Will sell for \$350.00 f.o.b. Shawinigan Falls,  
P.Q. Northern Aluminum Company, Limited.

## For Sale Cheap

1—Box Girder Type Overhead Hand  
Power Crane, 48' 6" span, 5 tons  
capacity; complete, less the  
Hoist. This is a good Crane for  
Foundry, Boiler Shop, Store-  
house, Stone Yard, etc.

1—12" Single "I" Beam Overhead  
Hand Power Crane, 30' 10" span,  
3 tons capacity; complete, less  
the Hoist.

1—Brantford (Gas) Bake Oven and  
4 Racks.

1—Linderman 2-Spindle Boring  
Machine.

1—26" Drill, London Machine Tool  
Company.

1—Bowser 40 Gal. Varnish or Oil  
Jump and Tank.

11—New 1-13/16" High Speed Twist  
Drills, No. 5 Morse Taper Shank.

30—Used 1-13/16" High Speed Twist  
Drills, No. 5 Morse Taper Shank.

**M. BEATTY & SONS**

Limited

Welland, Ont.

**BRASS RODS, 1¼, 1½, 1¾ UP TO TEN-FT.**  
Brass tubings, 2½ o.d., with ¼ wall; all  
lengths to ten feet. Louis Lovitz, 186 Mark-  
ham St., Toronto. Telephone College 3711. (17)

**FOR IMMEDIATE SALE, TORONTO—3,000**  
feet seamless steel tubing, 1½" O.D. by  
5-32" wall. No reasonable offer refused. Box  
226 Canadian Machinery. (15)

**FOR SALE—TWELVE H.P. GAS OR GASO-**  
line Engine, Gould, Shapley & Muir Ideal.  
In first-class condition. Cheap. Stedman  
Brothers, Ltd., Brantford, Ont. (21)

**FOR SALE—FIVE THOUSAND FEET OF 1"**  
black piping. Newell Mfg. Co., Prescott,  
Ont. (18)

**BUSINESS FOR SALE — MACHINE SHOP**  
with a good, steady run of work and always  
busy. A good opening for a young man to get  
into business. Owner has other interests. Box  
224, Canadian Machinery. (13)

**WE CAN GIVE EARLY DELIVERY ON**  
dificult fixture cutting, also on gauges and  
jigs. We have a large shop and the finest  
equipment. Apply Box 235, Canadian Machin-  
ery.

**FOR SALE — IMMEDIATE SHIPMENT —**  
New Heavy Duty Shell Boring Lathe for  
manufacture of 6" High Explosive Shells. Write  
for complete specification. Wm. Hamilton Co.,  
Ltd., Peterboro, Ont. (20)

**1-2-SPINDLE SHAPER, WOOD TOP, JOHN**  
Ballantyne, Preston, make, used two months.  
1 Dynamo, 45 lights, Toronto and Hamilton  
Electric Co. make. Used five months. Good  
as new. Box 195, Jordon, Ont. (R.T.F.)

**FOR SALE—1 40 H.P. ROBE, ARMSTRONG**  
high-speed engine; 1 4 x 1 Marsh deep well  
steam pump, and 1 Barton generator, 80 lamp  
capacity, with switch-board. All in good or-  
der and cheap for quick sale. Richards-  
Wilcox Canadian Co., Ltd., London. (20)

**FOR SALE.—ONE BROWN-BOGGS MARK-**  
ing Machine, suitable for 6" Mark XVI. or  
Mark III. English Shells. Only object in sell-  
ing is that other methods of marking have  
been adopted. Price on application. Taylor-  
Forbes Co., Ltd., Guelph. (14)

**FOR SALE—BOILER REPAIR AND SHEET**  
iron works. Fine opening, one of the best in  
Canada, for a good man. Only repair shop  
in county. Equipment alone will list at  
nearly \$2,000. Will sell for \$1,200. Write  
for particulars. Box 213, Canadian Machinery.

**GAP LATHE — LONDON TOOL CO. —**  
swings 41" in the gap, 26" over shears,  
20 ft. bed, rod and screw feed, compound rest,  
steady rest, countershaft, 2 face plates, 4-jaw  
chuck, weight about 10,000 lbs. This tool has  
been very little used, and is in excellent con-  
dition. Bargain for quick sale. Winnipeg  
Machinery Exchange, Sutherland & Gladstone  
Sts., Winnipeg, Man. (17)

## REPAIRING

**ALL KINDS OF MACHINERY REPAIRED,**  
rebuild and installed. W. H. Sumbler Mach-  
inery Co., 643 Yonge Street, Toronto, Ont.

## PATENTS

**NOTICE IS HEREBY GIVEN THAT SWIFT**  
& Company has obtained for Canada  
Patent No. 168736, in connection with a  
branding tool device, and the firm of Pat-  
terson & Heward, of Toronto, Ontario, is  
manufacturing this article and is prepared to  
supply the same to any person who may wish  
to purchase the same at a reasonable price.  
Any person, firm or corporation desiring to  
purchase this article will kindly communicate  
with Patterson & Heward, Toronto, Ontario.  
(21)

## SITUATIONS WANTED

**TOOL MAKER IN CHARGE DESIRES**  
change. Competent to take charge of ma-  
chine shop or tool room. Good references.  
Box 225, Canadian Machinery. (17)

**PRODUCTION MANAGER, YOUNG MAN, 10**  
years' experience, interested in high-grade  
permanent position, capable either installing or  
maintaining and improving efficient production  
system covering all manufacturing details from  
design to shipping platform. Box 240, Cana-  
dian Machinery. (23)

## SITUATIONS VACANT

**WANTED—NIGHT SUPERINTENDENT TO**  
take charge of factory making 4.5 sockets.  
Apply Box 237, Canadian Machinery.

**FOREMAN TOOL-MAKER WANTED — TO**  
take charge of tool room in plant manu-  
facturing 4.5 sockets and other munition work.  
Apply Box 236, Canadian Machinery.

**WANTED — EXPERIENCED STEEL**  
works draftsman for Nova Scotia. Give  
full particulars, including salary, permanency.  
Apply Box 234, Canadian Machinery. (17)

**ALL-ROUND MACHINISTS WANTED FOR**  
tool-room; highest wages paid. A. R.  
Ormsby Co., Limited, 48 Abell Street, Tor-  
onto. (21)

**WANTED SUPERINTENDENT FOR FAC-**  
tory machining 4.5 shells. To one who has  
had successful experience, and can produce re-  
sults a liberal proposition will be made. Ap-  
ply Box 242 Canadian Machinery. (20)

**SPLENDID OPPORTUNITY FOR YOUNG**  
man about twenty-one, well educated and  
with some mechanical knowledge, who desires  
to learn the machinery business. Apply in  
first instance with full particulars as to ex-  
perience, etc., to Box 243 Canadian Machinery.

**WANTED — MANAGER MACHINE TOOL**  
department. Must have full knowledge of  
general miscellaneous machinery, especially for  
munition plants. Position affords every op-  
portunity for advancement. Please state ex-  
perience and salary expected. Apply to Box  
239, Canadian Machinery.

**WANTED — SUPERINTENDENT FOR 18-**  
pdr. shrapnel shell factory equipped  
and now turning out 1,200 shells per day;  
must have good executive ability and able to  
produce results; liberal salary to right man.  
State fully past experience and record, and  
salary expected. Address Box 238, Canadian  
Machinery. (19)

## WANTED

**WANTED — BORING MILL, 30" TO 42"**  
table; state make, condition, time used,  
lowest price, and send cut to Winnipeg  
Machinery Exchange, Sutherland and Glad-  
stone Sts., Winnipeg, Man. (21)

**WANTED TO MANUFACTURE A FEW**  
lines of metal products, sheet metal pre-  
ferred. We have complete equipment for high-  
class work. Give complete description and  
rating in first letter. Apply Box 221, Cana-  
dian Machinery. (17)

**WANTED—12" BAR ROLLING MILL TWO**  
or three high with steam drive. One three-  
ton Steam Hammer. One half-ton Steam Ham-  
mer. One pair Rolling Mill Shears. With full  
particulars and lowest price. Apply Box 218,  
Canadian Machinery.

**WANTED — THREE TURRET LATHES**  
suitable for steel sockets, also Thread  
Millers suitable for milling outside thread of  
sockets. Give price and particulars to Steel  
Furnishing Co., New Glasgow, N.S. (19)

# Pulverized Fuel Application to Steam Locomotives\*

By Joel S. Coffin, Jr.\*\*

*Pulverized fuel firing is a development which has already made considerable headway, both as regards its practical application to steam locomotives, and to stationary steam boiler installations. The probability that steam coal will maintain in large part permanently its meantime well-nigh prohibitive cost, and the fact that immense quantities of what is now missed go more or less to the discard heap, have contributed materially to bring about the substantial progress and accomplishment which to-day is in evidence. The accompanying article sheds considerable light on the future possibilities of pulverized fuel firing generally.*

**C**OAL dust as fuel was first experimented with as far back as 1818, but it was 1895 before its actual industrial application began, at which time the increased cost of fuel oil resulted in its use in cement plants. About sixteen years ago the Manhattan Elevated Railroad in New York City experimented with pulverized coal on one of their locomotives, using a combined pulverizer, blower and steam turbine, located on the locomotive. The cylinder exhaust was not used to create boiler draft; the coal was coarse; and no means of precipitating, cooling and collecting the slag were provided, all of which led to the disuse of this equipment. During the past few years, the Swedish Government Railways have also experimented with burning peat and powdered coal on some small locomotive boilers. The powder, however, is blown into the furnace by steam, and the fire box brick work is very complicated.

The first locomotive of any size, to be equipped and successfully operated, having a self-contained equipment for burning pulverized fuel in suspension, was

of the Atlantic type locomotives on the Chicago & North Western.

The equipment and method of burning pulverized fuel in steam locomotives has passed the experimental stage, and early this spring the first complete commercial installation of a fuel drying and pulverizing plant and coaling station, in combination with a locomotive operating in regular train service, and equipped for burning pulverized fuel was made by the Delaware & Hudson Co. Since last spring many other arrangements have been made, and the equipment is now being furnished as rapidly as it can be produced.

## Suitable Fuels

Based on the various coals tested to date, any solid fuel, having two-thirds of its content combustible, when in a dry pulverized form, is suitable for steam generating purposes. Dust, sweepings, culm, slack and screenings, which are generally considered waste, unsaleable, and otherwise low value coal mine and strip pit products, as well as lignite and peat, are as suitable as the larger

Fixed carbon .... from 58% to 34%

Ash ..... from 26% to 30%

Sulphur averaged from 3 per cent. to 9 per cent. and the B. t.u. from 10,900 to 8,800. No difficulty whatever was found in maintaining maximum boiler pressure when working the locomotive using this fuel, under most severe operating conditions.

At the Hudson Coal Co's. power plant at Olyphant, Pa., they are burning clear anthracite slush, which is really the discoloration in the water after it has been used for washing their coal. This water is run into bins where the liquid drains off leaving the slush, which is then dried and pulverized, and burned in their stationary boilers. On the D and H engine No. 1200, they are now burning anthracite slush, mixed with 40 per cent. bituminous, and are getting exceptionally fine results.

Both time and money have been spent in briquetting small coal, but as a general proposition it costs from seventy-five cents to one dollar a ton, whether the coal is bituminous or anthracite, which is prohibitive, and the bonding

STEAM LOCOMOTIVE IN PART SECTION, EQUIPPED FOR BURNING PULVERIZED FUEL.

a ten-wheel type engine of 31,000 pounds tractive power on the New York Central Railroad, which was converted in the early part of the year 1914. Later a similar application was made to one

sizes and better grades of coal for drying and pulverizing to be burned in suspension. The semi-bituminous coal from Brazil, South America, is probably the most severe test yet made. This coal analyzes when pulverized:

Moisture ..... from 2% to 28%  
Volatile ..... from 14% to 28%

material will always burn out first, and does not add anything to the fuel value of the coal. The solution of the small coal proposition, therefore, lies entirely in pulverizing.

## Preparation

The coal must be properly dried and prepared in a pulverized form before

\*Paper read before the Canadian Railway Club, Montreal, Nov. 16, 1916.  
\*\*Canadian Sales Manager, Locomotive Pulverized Fuel Co.

supplying to the locomotive tender, and to do this a suitable storage, crushing, drying, grinding and conveying plant is installed at the principal coal handling stations. Pulverized fuel, to produce the best results, should not contain an excess of 1 per cent. of moisture, and should be of uniform fineness, so that not less than 95 per cent. of the total will pass through a 100 mesh, and not less than 85 per cent. of the total will pass through a 200 mesh screen. This fineness is required, as the greater degree of uniformity in fineness, the greater assurance that every particle will burn instantaneously, when in suspension in the fire box.

Although coal has been burned in pulverized form, having a moisture content greater than the 1 per cent. mentioned above, it is not advisable to do so. When undried coal is fed into the furnace, the moisture must be evaporated in the furnace, which not only results in a reduction of furnace temperature, but also in a direct heat loss. This means that additional coal must be fired to overcome the above resultant losses. Further, during the process of grinding, conveying, storage, and combustion, dry coal will readily flow and give less trouble tendency to pack, clog and adhere. Care must also be taken in the construction of storage hoppers to eliminate the liability of the prepared coal absorbing any moisture.

The total cost to dry and pulverize fuel in a suitably equipped plant, will vary from ten to fifty cents per ton, depending upon the plant's capacity. For the railway coaling station of average capacity, this total cost will be less than twenty-five cents per ton, which is more than offset by the ability to utilize mine refuse and sweepings, run-of-mine, screenings and slack grades of coal that cannot now be used to good advantage, as well as inferior grades of sub-bituminous coals, lignite and peat, at considerably lower cost per ton than the better grades now required for burning satisfactorily on the grates. The general average, from available records, covering periods of the past five to ten years at cement and metallurgical plants show the following costs, assuming that the coal requires crushing in addition to the pulverizing, and has a moisture content of from five to ten per cent. when placed in the dryer:

Capacity of plant in short tons per hour	Average total cost for preparation per short ton
2 .....	from 25 to 50 cents
3 .....	from 20 to 45 cents
4 .....	from 16 to 40 cents
5 .....	from 14 to 35 cents
10 .....	from 12 to 30 cents
25 .....	from 10 to 20 cents

The fuel required for drying the coal

averages from one to two per cent. of the coal dried, and the distribution of the cost is approximately as follows:

Fuel for drying .....	10 percent.
Power for operation ....	30 percent.
Labor .....	30 percent.

It is often asked if it is possible to pulverize coal at the mines and transport it successfully. This would be almost impossible for large quantities, as the pulverized coal packs very solidly. The only way it could be done would be to ship it in tanks, so constructed that the coal could be readily fed from them by a suitable conveying means.

### Equipment

The following principal factors have been kept in mind in designing the equipment employed in connection with the burning of pulverized fuel in a steam locomotive.

1—Readily applicable to either new or existing locomotives of standard design.

2—Simplicity and the standardizing of various details, making them interchangeable for different types and sizes of locomotives.

3—Applying all possible operating equipment in a self-contained manner to the tender fuel tank, leaving only the fuel and air supply control levers in the cab.

4—The elimination of all complicated fuel conveying mechanism between engine and tender.

5—Elimination of all manual handling of fuel, fire or ashes in the operation.

6—The positive control over the fuel feed, which will quickly meet all conditions of road or terminal operation.

7—Provision for quick firing up, free steaming, perfect combustion, regularity of boiler pressure, uniform fire-box temperature, and maximum capacity of boiler with the minimum heat loss.

8—The entire regulation of combustion is controlled by three levers in the cab, namely; fuel feed, air supply and induced draft (the latter is only used when locomotive is not using steam).

9—The arrangement of the refractory furnace, which provides ready accessibility to all parts of the fire box for inspection and maintenance.

10—Positive assurance of a supply of dry fuel under all conditions of weather.

11—Elimination of the necessity of firing tools, such as scoops, rakes, hoes, slash bars and grate shakers, as well as the glare, heat effect and lowering of

fire box temperature, and draft from furnace door openings.

12—Reduction to minimum of noise and dust in the cab.

13—The reduction of engine house facilities and delays, and expense incidental to the building, preparing, cleaning and dumping of fires, and hosteling locomotives.

14—Making the pulverized fuel burning and storage equipment on the engine and tender readily convertible for the use of fuel oil.

The following are the only changes incidental to the application of pulverized fuel burning equipments to existing types of steam locomotives:—

**Smoke Box.**—Remove the existing diaphragm, table and deflector plates, nettings and cinder hoppers and enlarge the exhaust nozzle opening.

**Fire Box.**—Remove present grates, ash pans, fire doors and operating gears; utilize the usual arch tubes and sectional type of brick arch; and install fire brick lined fire pan, slag-pan, primary arch and fuel and air mixers.

**Cab.**—Install furnace door, and fuel and air supply regulating levers.

**Tender.**—Install enclosed fuel container equipment with fuel and pressure air conveying, feeding, commingling and discharge apparatus, and steam turbine operating mechanism.

**Engine and Tender Connection.**—This is made by the use of one or more hose, which connect the fuel and pressure air outlets on the tender, with the fuel and pressure air nozzles on the engine. Also the use of metallic flexible conduits for conveying the fan and fuel feeding motive power.

### Operation

When firing up a locomotive, the draft is formed in the usual manner, by turning on the stack blower. Then a piece of lighted waste is put through the fire box door opening and placed on the furnace floor directly ahead of the primary arch. The pressure fan and one of the fuel and air pressure feeders are then started. Full steam pressure can be obtained in from forty-five minutes to one hour, from water at a temperature of forty degrees F. The fire is then controlled by the regulation of the fuel and air supply to meet the various conditions of standing, drifting or working. The stack blower is used only when the engine is not working steam. The feeding and burning of pulverized fuel is briefly as follows:

The pulverized fuel, having been placed in the enclosed fuel tank on the tender, gravitates to the conveyor screws, and is carried to the fuel and pressure air commingler where it is thoroughly mixed with and carried by the pressure air through the connecting hose to the fuel and pressure air noz-

zles on the engine. From these nozzles, it is blown into the fuel and air mixers, where additional induced air is supplied, and the combustible mixture, thus formed, is induced by smoke box draft into the furnace, where it ignites in nearly a gaseous form. The flame formed at this point obtains its maximum average temperature of from 2500 to 2900 degrees F. in the forward combustion zone under the main arch, where auxiliary air, heated to a very high temperature, is also induced by smoke box draft, to finally complete combustion.

The coal being pulverized so fine, each little particle of fuel is assured of being in direct and intimate contact with the exact amount of air to complete its combustion. The little particle of white feathery ash, which is left in suspension, will be carried with the gases, through the flues and out of the stack, unless the temperature is higher than the fusing point of that particular ash, when it will liquefy, and on account of its density, run down the underside of the main

arch and the front and sides of the furnace walls, and be precipitated into the self-clearing slag-pan, where it accumulates and is air cooled and solidifies into a button of slag. This slag

feeder has a range in capacity of from 500 to 4000 pounds of pulverized fuel per hour, and it being possible to easily apply one to five of these to the ordinary locomotive tender, there is no difficulty in meeting any desired capacity.

### Danger

Organic dust or any combustible material of certain fineness, suspension, and temperature, such as the dust in grain, soap, sugar, planing and other mills, is explosive. Coal, pulverized to the required degree of fineness, carries no danger unless combined in a dry state, in floating suspension, in nearly still air and mixed with the proper proportion of oxygen at the requisite temperature to produce primary ignition. There are certain established rules and regulations governing the manufacture, storage, handling and use of pulverized fuel, which make it comparatively easy to avoid trouble.

### General Results

The smoke box gas analysis will

55 per cent. on a superheater equipped locomotive boiler, working at from one-half to maximum boiler horsepower capacity, is increased from 10 to 15 per cent. The poisonous and suffocating effect of the products of combustion coming from the stack, are very materially reduced, as the sulphurous and other poisonous gases, resulting from combustion, tend to combine with the liquid ash into slag.

Another important result is the elimination of sudden changes of temperature in the fire box. From recent scientific experiment, it has been found, for example, that each time the fire door is opened to put in coal, there is a drop in the temperature of the fire side of the fire sheet of from 250 degrees to 300 degrees, F., and that the action of the sheet was first backward, then upward, and then forward. This condition does not exist with the use of powdered coal, and further, the sudden change of temperature, which obtains on hand fired locomotives in going

from the ash pit to the round house after the fire is cleaned, is entirely eliminated, which results in reducing fire box maintenance to the minimum. It stops the practice of "slugging" in firing, as the feeding of excess fuel has the same effect on steam generation as an insufficient supply.

The following conclusions will briefly set forth the results of the practical application and operation of pulverized

FOUR TONS PER HOUR PULVERIZING PLANT, ARRANGED FOR EIGHT TONS PER HOUR FUTURE CAPACITY.

is easily dumped by opening the drop bottom doors.

By referring to the photograph it will be seen that the flame and products of combustion at all times flow (by induction) towards an opening, for as explained above, the fuel is blown, or forced as it were, only as far as the mixing chambers, and induced from that point. Therefore, you do not get any Bunsen burner effect or destructive impinging action against the brick work and heating surfaces. The fuel and pressure air feeder are so arranged that a certain number of revolutions represent so much coal; and as each

average between 13 and 14 per cent. of CO<sub>2</sub> when coal is fired at the rate of 3000 pounds per hour, and increases to between 15 and 16 per cent., at the rate of 4000 pounds per hour, showing that there is no falling off in efficiency as the rate of combustion increases as is the case when coarse coal is fired on the grates. The smoke box temperatures have varied from 430 to 482 degrees F., with superheated steam having a temperature of from 580 to 715 degrees F. respectively. The evaporation averages from 8½ to 12 pounds of water per pound of coal. The boiler efficiency, which now ranges from 65 to

fuel burning locomotives that have been in use during the past two years on several railways in the United States:

### First—Saving in Transportation Expense

(a) Increased train load over ruling grades and on long pulls, due to greater boiler capacity and efficiency, improved steaming, and reduced cylinder back pressure.

(b) Reduced handling and delay of locomotives on engine-house and ash-pit tracks through the elimination of cleaning, dumping and rebuilding fires.

(c) Reduced fuel consumption at

terminals and on road through more effective combustion and positive control over the fuel feed.

(d)—Ability to utilize grades of fuels that are not now suitable for burning on grates in locomotives.

(e)—Greater average monthly mileage per locomotive.

(f)—Less liability for engine and train crew overtime, particularly on relatively long runs.

(g)—No necessity for arduous labor or equipment to shovel or push coal ahead on tenders, or fire coal on grates.

(h)—Less coaling station expense.

(i)—No ashes and cinders to be disposed of at terminals and on the line of road.

(j)—Elimination of smoke, sparks, cinders and fire hazard, resulting in less loss and damage claims.

(k)—Less classification and switching of company—use fuel at coaling stations.

(l)—No spilling or loss of fuel from tenders or through grates.

(m)—No special fuel or equipment, and quicker and more economical firing up of locomotive.

#### Second—Saving of Maintenance of Way Expense

(n)—Elimination of liability for burning of wooden trestles and cross ties.

(o)—Better drainage and reduced forking of ballast due to elimination of ashes and cinders along the right-of-way.

(p)—Less up-keep of existing fuel ash handling stations and equipment.

#### Third—Saving of Maintenance of Equipment Expense

(q)—Elimination of grate, ash-pan and smoke box draft appliance inspection, adjustment, repairs and renewals.

(r)—Reduced fire-box and boiler repairs and renewals through the maintenance of more uniform steam pressure and fire-box temperatures.

(s)—Elimination of firing tools, squirt hose and like loose equipment.

(t)—No clogging or cutting out of boiler or superheater flues with ashes or cinders.

(u)—Less trouble through neglect of proper methods of firing coal on grates.

#### MACHINE TOOL INDUSTRY IN JAPAN

ALTHOUGH it is only within the last ten or fifteen years that the Japanese have taken up the manufacture of machine tools on any scale, this now promises to become an important native industry. Very little progress was made until about four years ago, when the

Government decided that it was time to encourage domestic manufactures, with the double object of checking the excessive flow of specie abroad, and of rendering the markets less dependent on foreign supplies. Government works and dockyards were instructed not to buy imported machinery if suitable domestic substitutes could be obtained, and contractors to the Government were requested to use as much domestic material and machinery as possible in the execution of contracts. Influential people were sent around the country to encourage this propaganda, and further assistance was given in many ways, such as by paying higher prices for home-made machines than for imported ones, etc. This naturally led to the establishment of works for the manufacture of machine tools, and it must be said that rapid strides were made in the quality of their products.

#### War Time Development

The war in Europe has had a great effect in the development of this industry, as owing to the difficulties of obtaining imported machines, and to the very long deliveries quoted, the Japanese were thrown practically upon their own resources. As an example of what has been accomplished, it is stated in Herbert's Monthly Review that recently a large works was established for the production of a certain article, the plant consisting of, roughly, 1,000 engine lathes, 300 capstan lathes, 150 sensitive drilling machines, etc. Within three months of the first orders being given out, the whole works were completed, and the plant installed, over 90 per cent. of the machines being Japanese made.

The greatest difficulty has been the lack of skilled workmen, but the universities and technical schools are doing their share in turning out students having a sufficient knowledge of engineering to enable them to take their places in the works now established. Of course, there are instances of valuable machinery being badly treated owing to lack of knowledge by the operators, but in this respect the Japanese, as a whole, are no worse than other countries, taking into consideration the age of the industry.

It must be borne in mind that it was only a matter of 50 years or so ago that Japan was thrown open to foreign trade. The developments made in this time are little short of marvellous. The Japanese are very quick in adjusting themselves to new conditions, and any new methods which come along, having advantage over the old, are soon adopted. For example, in England and the United States, it is common practice for manufacturers of high-class machinery to keep a staff of expert operators, who visit their customers' works when new machinery is supplied, and instruct

workmen in the efficient handling of same. This, however, is not the case in Japan. In many instances the importing houses hear very little further of any machinery they may supply when once delivered and paid for. It is necessary, however, for the suppliers to have salesmen who know the machines they sell, and it is a mistake to think that it does not matter much who shall be the manufacturer's agent or representative. This, however, is getting away from the subject of this article.

#### Cheap Labor

Labor in Japan is very cheap, and this has a considerable bearing on the cost of manufacture. On an average, the following are the wages paid to artisans:—Fitters, 75 cents per day; turners, drillers, etc., 50 cents per day; boys (apprentices), from 10 cents to 20 cents per day; laborers, about 25 cents per day. Hours of labor are fairly long, the general rule being a 9½ hours day, including Saturdays. Some of the smaller works run on Sundays, and have the 1st and 15th of every month as holidays. This, however, is gradually being superseded, and Sunday is now generally becoming a day of rest. Labor troubles and disputes are very rare, and though there are many unions looking after the interests of workmen, it is very seldom that these come into public light. Female labor is used to a large extent, though it is generally on unskilled work. Many shops employ women laborers for cleaning up, carrying away dirt and waste, and keeping machines free from cuttings, etc. Some foundries even employ women for fettling castings and similar laborious work.

#### Methods and Processes

Regarding methods of manufacture and processes followed, there is little worth special mention. Jigs and fixtures are not used to any great extent, probably because there has not been any serious attempt to turn out machines on a manufacturing basis. Most of the works will accept any order that comes along within their capacity, consequently there is little opportunity for specialization. A point which is worthy of notice is the fact that the advantages of powerful plain milling machines are not appreciated as much as they might be. The majority of horizontal milling machines in use are of the universal type; which machine, though essential in the tool room, is hardly a manufacturing machine. Universal machines, however, of any type, always meet with a better reception than plain powerful machines, this, no doubt, being also an effect of the general principle of taking on any job that comes along. Turret lathes are much appreciated, but owing to the cheapness of labor automatic machines have not found much favor.

and Ideas Evolved from Actual Practical Application and Experience

## THE MANUFACTURE OF SHRAPNEL PLUGS—I.

By J. Davies.

**T**HE shrapnel plug is a very simple looking article—there is nothing elaborate or imposing about its appearance, yet to manufacture it to standard requirements, a high degree of mechanical skill is necessary. The limit of error allowed in the different sizes is very small, besides which it is rather an awkward piece to handle. It weighs when finished between 9 and 9½ ozs. and the operations must be so simplified that an unskilled workman can perform them. The methods here described are in use by a Canadian firm whose daily output is about 20,000 plugs per day.

### Casting the Blanks

The pattern, Fig. 1, is an aluminum plate, about  $\frac{3}{8}$  in. thick, made to fit a common foundry flask, such as is used in moulding machines. The plate has 12 holes bored in it, and each hole is fitted with an aluminum pattern. These patterns are made long enough to allow for the thickness of the plate, so that the portions above and below the surface of

FIG. 1.

the plate make up the exact length of the plug. The cores for the square hole in the top of the plug are made in a core box, shown in Fig. 2. It is a very simple

FIG. 2.

but effective little box, made of cast iron, and in two parts, which are held in proper relation to each other by two dowel pins, the coremaker simply holding the two halves together by the pressure of

his hands. The moulding is done by a number of pneumatic moulding machines.

The rough plugs are conveyed from the foundry to the cleaning or milling room by means of an overhead track, which runs through every department.

FIG. 3.

The plugs are loaded up into buckets or round iron cans, which are raised from the floor by means of a bevel wheel and screw arrangement operated by hand. When the plugs reach the milling room, they are dumped into an ordinary foundry mill and thoroughly cleaned and inspected for defective castings, each moulder's work being put into a separate mill.

### Forming the Thread

The first, and probably the most important, machining operation is threading; it must be a clean, smooth thread, 14 threads to the inch, and within all the limits for size of Government requirements. The plugs are not turned or machined in any shape or form before threading. They go to the threading machine direct from the foundry, milling or cleaning room.

A sketch of the threading die is given in Fig. 3. The body A is made of soft cast-steel, turned to a standard diameter of 5½ in. to fit the die holders of the machines, which are all alike, so that the dies are interchangeable. This is very necessary, as the dies must be kept in perfect condition, and require to be changed quite often. These dies are 1¼ in. thick, and have five slots, 5-16 in. wide and ¾ in. deep, to take the thread chasers. The slots are cut in the die ⅛ in. ahead of the centre, so that when the chasers are fast in position, the cutting edge is ⅛ inch in advance of the centre. This has been found by extended

experiments to give very good results.

The thread chasers are held in position by keys which are slightly tapered, well fitted and driven home. Adjustment for size is made by means of the tapered key fitted behind the thread chaser. A key seat is cut on the outside of body, as shown in sketch for driving, and two safety set screws are used to prevent the die dropping out of its place.

### Making the Chasers

The thread chasers themselves are made about 2 in. long, so that the ends can be ground a number of times before they are worn out. The thread is cut on the chaser blades in the lathe by means of a master tap and a suitable jig for

holding the work, Fig. 4. A cast iron block is made to fit the top of the lathe tool post, and firmly secured by the bolt B; C is the blade to be threaded, which fits in a step on the block A machined to receive it. It is held in position by a plate and two set screws shown. The

FIG. 4.

master tap D, is held between the centres of the lathe, and clearance is obtained in the chaser blade by setting it up above the centre, the top of the chaser being 3-16 in. above the centre of the lathe. The lathe is geared up to

correspond with the number of threads per inch on the master tap. The blade is fed against the master tap until a complete full thread is cut.

#### Assembling the Die

After the threaded blades are hardened and the keys have been fitted in, the

FIG. 5.

die is ready to be assembled or set up. This is a very important part of the work, and is accomplished by means of a bench jig. Great care must be taken in the assembling of the dies, as they must be interchangeable and cut a complete full thread from the rough casting in one cut within the allowable limit for size, which is only a few thousandths either way; a few thousandths is left for the final re-threading, which is done by hand after all other machine work is done. The points to be observed in assembling the die are:—

- 1.—That the threads have the proper relation to each other—that is, that they perfectly follow each other, the same as the threads on the master tap.
- 2.—That they will cut the right size.
- 3.—That they are perfectly concentric with the outside of the die, so that they will run true in the machine. All these results are obtained by means of bench jig shown in Fig. 5.

#### Assembling Jig for Dies

A cast iron block is bored to fit the outside diameter of the die and to a depth equal to the thickness of the die. It is also bored to fit the shank of a standard plug used for assembling the die. The plug used in this jig is threaded exactly the same as the shrapnel plug. Five grooves are cut in it, so that the die can be placed over it when it is fast in position. The threaded blades are set

up against the threads of the plug and secured in the right position by means of the keys.

#### GANG TOOL FOR PISTON RINGS

By "Nene."

THE manufacture of locomotive piston rings presents some problems, worthy of consideration, by the machinist of to-day. These rings should fit in the grooves in piston head fairly close, the limits being .002 in. between the plug gauge for the grooves, and the snap gauge for the thickness of the rings, the plug gauge being .002 in. larger than the snap gauge.

Previous practice had been to turn these rings in the form of a cylinder or bull ring on a boring mill, and part off each ring separately, at the same time facing off the upper side of ring to pro-

The thickness of the third ring being governed by the setting of the tool the proper distance from top of bull ring. The wedge bar (c), Fig. 1, is for binding all the tools firmly together, by tightening the set screws at the bottom of the tool; the cutters are also clamped by the set screws on top of tool, rendering the whole arrangement solid and compact. The centre set screws are left longer than the other screws, to facilitate the use of wrench on same.

Difficulty had always been experienced in procuring high speed steel of suitable cross section, for this purpose, possibly owing to the fact that our purchasing agent was not impressed with the necessity for the steel being an exact duplication of steel formerly supplied by being influenced more by market quotations, etc. To overcome this inconvenience we now make our own cutters, by forging the high-speed steel to required

FIG. 1. GANG TOOL FOR PISTON RINGS.

per thickness. The gang tool described below is the result of an effort to reduce the cost of these operations. Other styles of gang tools were tried for parting off four or more rings at one operation, but for various reasons, they proved unsatisfactory, hence the development of the tool herein described.

The sketches, Fig. 1, show clearly the construction of the tool, the body of the tool being made from a forging of axle steel, with the shank machined to fit a Bertram boring mill. Note the generous depth of the tools, 1 3/4 in., our experience having shown that the usual 3-16 in. x 1 in. steel, made for this purpose, is not sufficiently strong to stand the heavy strain occasioned by modern high-speed machinery. The wedge-shaped bars (a) and (b), Fig. 1, afford adjustment for width between the tools, thus determining the thickness of the lower two rings.

shape, and finish by grinding in surface grinder. Fig. 2 shows one of the jigs used for holding the cutters for grinding the sides of cutter, in surface

FIG. 2

grinder. This fixture is a simple arrangement and should require no further experimentation other than the sketch.

# Principles and Apparatus Employed in Testing Limit Gauges-II

By R. T. Glazebrook, C.B., F.R.S. \*\*

*Perhaps no finer evidence of the value of the National Physical Laboratory in England can be offered than the work of which this paper is at best an outline only. The enormous number of gauges required for munitions production was only possible as a result of training given to numerous skilled toolmakers at this institution. The value of properly made gauges will be still more appreciated in the future and increased demands on the Laboratory resources for testing precision apparatus by engineering firms are confidently predicted.*

**T**HE detection of errors and accurate determination of the variations is of as great importance as the suitability of the design employed for gauges. Screw thread measurements constitute an important section of the work, and several special machines have been built for this purpose.

## The Tolerance Feature

We pass next to the tolerances on the gauges and the means of detecting these; the last is closely connected with the methods of production, and has recently been discussed in a memorandum "Notes on Screw Gauges" (to be obtained from Mr. W. F. Parrott, The Causeway, Teddington, or through the Engineering Standards Committee), issued in February, 1916, from the National Physical Laboratory. In the case of a plug gauge, if a satisfactory ring check is available, the first step will normally be to try it with this. If it fails to enter it is usually rejected, but further examination is made to see to what particular the failure is due. If it enters, examination is still necessary to determine whether it is up to size in all its elements; it may have an excessive pitch error, which is compensated for by a large reduction in its effective diameter, and in this case it is useless as a gauge. Thus in nearly all cases measurement is required. For the full diameter a micrometer or some simple form of measuring machine is all that is needed. The principle involved in the measurement of the effective and core diameters is shown in Figs. 5, 6, and 7.

## Effective Diameter Measurement

For the effective diameter, three small circular cylinders — three carefully selected needles of known diameter—are inserted in the thread and a micrometer reading is taken over these; the mean diameter of the needles is determined by measuring them when suspended against a cylinder of known dimensions, and from these two readings the effective diameter can be calculated. Instead of a plain cylinder, we may employ a cylinder having a circular V groove with an angle of 55 degrees cut in it to a suitable depth. This is tested by means of two accurate cylinders, and

its effective diameter is found as though it were part of a screw thread; the method of using it as a reference bar is obvious.

For the core diameter the circular needles are replaced by three bars of triangular section, the angle at the apex be-

FIGS. 5, 6 AND 7.

ing considerably less than that of the screw; measurements are taken with the micrometer, (1) with the bars against a cylinder of known diameter, (2) with the bars in the thread, and the core diameter is thus found.

To carry out these measurements rapidly at the laboratory, a special appar-

diameter, a standard screw is placed between the centre, and one micrometer A is set to some convenient mark; the other, B, is then adjusted until the standard screw is just held between the micrometers; the pressure required for this should be very light, as the screw is easily deformed. Micrometer A is then withdrawn, the standard screw removed, and the screw to be examined put in place. This screw is then measured, using micrometer A. The difference in readings of A then gives directly the error in the full diameter of the screw.

## Pitch Measurement

Turning now to the measurement of pitch, we notice first that pitch error may be of two kinds—(a) a progressive error increasing regularly as we go along the screw; and (b) superposed in many cases on this a periodic error, depending frequently on some want of adjustment in the leading screw of the lathe on which the thread was cut. Examples of these errors will be given later. In measuring the pitch of a screw it is mounted on centres on a stiff bed which carries a saddle sliding parallel to the line of centres. This saddle is moved by a screw which has been carefully calibrated, and

FIG. 8. APPARATUS FOR MEASURING THE ANGLE AND FORM OF A THREAD.

atus is employed. The screw to be measured is held between suitable centres. A light carriage supporting two micrometers can move on balls either parallel to or at right angles to the axis of the screw; the axes of the micrometer are in the same plane as and at right angles to that of the screw. To measure the full

the motion is read on a larger micrometer head.

In its simplest form the saddle carries a pointer accurately ground to an angle of 55 deg., with its axis at right angles to that of the screw. The pointer can slide in the direction of its own length on the saddle. The pointer is set by the micrometer with its two edges in con-

\*Presented at the meeting of the British Association at Newcastle, September, 1916.

\*\*Head of the National Physical Laboratory, Teddington.

tact with the sides of a thread and a reading taken. It is then withdrawn, the micrometer is turned until the pointer is opposite the next thread, when it is again adjusted, and so on. A series of readings taken thus give the distances between the consecutive roots of the thread—i.e., the pitch, and from these the pitch error is calculated. The method is clearly slow, and not very accu-

FIG. 9.

rate; it is difficult to set the pointer. The method in use at the laboratory is as follows:—

The screw is mounted as before, but the feeler carried by the saddle takes the form of a small spherical ball at the end of a bent lever. The ball is held pressed into the threads of the screw by a light spring, and, as the saddle is traversed along, the ball moves to and fro, always remaining in contact with the screw. The ball is too large in diameter to reach the bottom of the thread. In its motion it slides down one flank of the thread until it is arrested by contact with the opposite flank when it immediately begins to move up this flank; this change of motion is very sharply defined. By noting on the micrometer screw the positions of the slider at which these changes of motion take place, we clearly have a means of measuring the pitch of the screw. To effect this a mirror is attached to the arm carrying the small sphere and rotates backwards and forwards as the arm moves. A spot of light reflected from the mirror on to a scale moves in one direction, then stops and moves back; after a time its motion is again reversed, and so on. The sharp reversals caused by the point of contact of the sphere, passing from one flank of the screw to the opposite flank are clearly defined, and by their means an accurate measure of the pitch is obtained.

#### Thread Angle and Thread Form Measurement

To measure the angle and form of a thread a microscope is most conveniently used. The microscope is fitted with cross wires, and can rotate about its

axis. Some means of measuring this rotation is required. Means also for bringing the part of the screw to be examined and for focusing are required, and care must be taken that the light which enters the microscope may come along the rake of the thread. The axis of the microscope is set at right angles to that of the screw. A simple apparatus has been devised at the laboratory for this measurement. See Fig. 8.

To make a measurement of the angle the microscope is first focused on one of the centres which carry the screw; it is then moved aside, and the screw is put in position and traversed by means of the adjustments until in the field of view. This method of focusing ensures that an axial section of the screw is under examination. The microscope is then rotated about its axis until the cross wire is along the flank of one of the threads and a reading is again taken; the difference between these gives the angle of the screw. By setting the cross wire to run along the crests of the thread and taking a reading the squareness of the threads to the axis can be verified, while the general shape of the thread is obvious to the eye. By attaching the part carrying the screw to two slides at right angles, one parallel to the other at right angles to the axis of the screw, fitted with accurate micrometers, measurements of the diameters and pitch of a small screw may be made.

In many cases, however, observations on angle and form can be made most readily by a projecting apparatus. The screw is suitably mounted and illuminated by the aid of a small arc lamp and condenser. Carefully arranged lenses throw a magnified image on a screen, and observations are made on this image. The lenses must be chosen to produce uniform magnification over the field, and there must be absence of distortion. At the laboratory lenses to secure this have been obtained, and the method has proved rapid and of great value. A magnification of 50 has been selected; the screen carries an accurate drawing of a section of the screw fifty times actual size. It is easy to compare the image formed with this correct profile. The screen carries adjustments which serve to bring the image and the drawing readily into coincidence. Another method of comparison is to project simultaneously the image of an accurate screw placed alongside the one under examination; the differences are readily apparent.

The checking of screwed rings is more difficult. Direct measurement is only possible if they are of considerable diameter. Means have been devised, provided the ring is not too small, and, where the information is specially required, are employed by measuring the diameters by the aid of small spheres fitting into the threads and internal micrometers. In general, however, check gauges are re-

sorted to, the Taylor system being employed whenever real accuracy is desired. This in itself does not give a measurement of the diameter, but it is generally possible by the use of a sufficient number of checks of slightly different sizes to form a close estimate of the limits within which it lies.

#### Form and Position Gauges

These which are often extremely difficult to make, to measure, and to check, perhaps hardly come within the category of limit gauges. In the case of plate form gauges the examination can sometimes be done readily by measurement, but check gauges are usually necessary, and the observation is made by bringing the two into contact on a plate of glass and holding them up to the light. The eye can readily detect a want of fit; to say exactly what is wrong is more difficult—e.g., in the case of an elaborate band gauge for a shell. We have found the difficulty best met by the supply to the maker of an accurate check in addition to the drawing. More recently the projection employed for checking the form of a screw thread has been freely used, and has given good results. Figs. 9 and 10 show some examples of such profile gauges.

Position gauges again need checks for

FIG. 10.

their verification, and the design and manufacture of these often present difficulties. The check is clearly an accurate replica of the part which it is intended to gauge, made, however, in a form which lends itself to exact measurement, so that its accuracy may be secured. The details of measurement will differ for each gauge, and no general account can be given.

Limit gauging is a wide field to discuss, and in this hasty survey the fringe has only been touched. The experience of the past year has shown its importance, and when once this was realized and the fact that accuracy was essential was grasped, British manufacturers have risen to the occasion, and may be proud of the output of serviceable gauges now supplied to munition works.

## SAFETY DEVICES IN THE MACHINE SHOP

By D. O. Barrett.

THE accompanying photos show a number of safety devices which the writer recently installed in a machine shop in order to comply with the particular state laws and the regula-

As the floor of the shop was of concrete, sockets of one and one-quarter inch pipe and six inches long, capped at the lower end, were set into the concrete flush with the floor. It was then possible to easily and quickly remove and replace any of the guards without difficulty. In assembling, the posts and tops

located as desired, holes being drilled through the tees and pipe, and five-sixteenth pins riveted in. This made a very substantial guard and one that can be easily built without any special method, the vertical posts are in one piece where otherwise they would be in two parts. In place of three-way elbows, a

FIG. 1.

FIG. 3.

tions of a liability company. All the guards were constructed of one-inch black iron pipe and regular fittings, special rail fittings being employed in only a few instances. No left hand threading was resorted to in any of the guards

were first screwed together. The tees used for the lower cross members were next bored out through the run so as to slip easily over the posts. The cross pieces were then entirely assembled and slipped into position, being afterward

tee, close nipple and plain elbow may be used, as shown in Fig. 6 showing the belt guard at the back of the Colburn boring mill. In place of a side outlet tee, two tees may be used as shown in the same cut. The guard in Fig. 2 had

FIG. 2.

FIG. 4.

45 degree elbows in the cross members to properly clear the belt of the horizontal boring mill. The guards for the drill presses, Figs. 7 and 10, were quite large in proportion to the size of the ma-

FIG. 5.

chine, but the one side was placed far enough away from the machine so that when the table was swung around it would clear the post. The gear hobber in Fig. 11 was placed close enough to the wall so that guards were only necessary at the sides.

The belt guards in Figs. 13 and 4, were constructed to have a utilitarian

FIG. 7.

value. The Little Giant keyseater was set out a considerable distance from the building column in order to take care of any large work that might come up. This necessitated a countershaft on the floor with the consequent waste of a considerable amount of space. The frame of the guards was brought up nearly to the height of the keyseater table and a

two-inch plank covering put over same. As a milling machine was located near the one end of the table, this was an admirable place for the dividing head and other tools. The belt from the ceiling to the floor countershaft was also protect-

FIG. 9.

ed by pipe on the two sides, and the other two sides were covered with plank which served for hanging up small tools, etc. This made a very useful arrangement as well as being fairly ornamental. In order to complete the four sides of the rectangle at the top it was necessary to bore out one of the three-way elbows and pin in the pipe.

FIG. 6.

FIG. 8.

The only addition which might be suggested in connection with these guards would be the use of screens covering the sides, but these were not thought ne-

FIG. 10.

cessary, nor were they asked for by the liability company.

### CAPITAL AND LABOR

STEPS are being taken to adjust various differences between capital and la-

FIG. 11.

bor. The Parliamentary Committee of the Trade Union Congress and the Employers' Parliamentary Committee are discussing means towards co-operative action, and the Government have been asked to assist in the matter and a deputation to the responsible Minister is being organized. It will be remembered that Mr. Runciman, the President of the Board of Trade, in reply to a deputation last week, hinted at Government measures for the establishment of a minimum wage for all workers. The proposals under discussion, briefly are:—

Membership of a trade union to be compulsory upon all workers.

Compulsory forty-eight hours' working week in every occupation.

Compulsory minimum wage of 30s for all adult workers.

No reduction of present wages or increase in working hours.

Complete recognition by employers of trade unions, and of agreements, entered into between the unions and employers' associations.

State unemployment pay for men and women out of work.

Settlement by the unions of the conditions of women's labor after the war.

It is hoped to arrive at a settlement which will run for at least three years as an experiment.

### CANADIAN TRADE

A GAIN of more than \$600,000,000 is shown in the trade statement issued by the Minister of Customs, Hon. J. D. Reid, covering the seven-month period ending Nov. 1. The grand total for the seven months, including the movement of gold as well as of merchandise, amounts to \$1,313,189,891, compared with \$709,537,

488 for the corresponding period of the last fiscal year. The October trade rose from \$150,004,125 to \$164,320,479, a gain of \$14,326,354.

Imports of mer-

chandise increased from \$39,515,144 to \$71,196,552 in October, and from \$253,107,663 to \$462,161,795 in the seven months, while exports of domestic merchandise rose from \$80,038,582 to \$85,312,175 in October, and from \$326,430,730 to \$622,033,689 in the seven months. The most important gain

FIG. 12.

in exports for the month of October is found under manufactures, the figures being \$12,880,731 in October, 1915, and \$28,637,814 in October this year. Exports of other lines were fairly well maintained with the exception of agricultural products, which dropped from \$39,833,353 in October, 1915, to \$27,306,934 in the same month this year.

### Canada to Supply World's Paper.—J.

E. A. Dubuc, President of the North American Paper Co., says that in his belief, Canada will eventually produce enough wood pulp to supply the needs of the entire world. Owing to the increasing demands for paper and the many uses to which it is being put, Mr. Dubuc does not look for any recession in the prices of paper. The North American Co. controls 1,360,000 acres of pulpwood lands and plans have already been perfected for a greatly enlarged output.

# PROGRESS IN NEW EQUIPMENT

A Record of New and Improved Machinery and Accessories for the Machine, Pattern, Boiler and Blacksmith Shops, Planing Mill, Foundry and Power Plant

## HEAVY DUTY GRINDER

**T**HE Ford-Smith Machine Co., of Hamilton, Ont., has recently placed on the market a combination traverse and form grinder for both standard and special cylindrical

a grinder built heavy enough to carry form wheels up to 8 ins. face, and with a hollow spindle to allow gripping the work close up, not to speak of the usual cylindrical traverse grinding features.

The headstock, as already stated, can

design, the heavy duty feature has been given due consideration and effect, all parts being of rugged construction so as to stand up to the most exacting requirements with at the same time the minimum of vibration. For form grinding, 20 horse power is required; and for traverse grinding from 10 to 15 horse power. The weight of the machine complete is 14,000 pounds, and the floor space occupied, 6 ft. x 15 ft.

HEAVY DUTY TRAVERSE AND FORM GRINDER FOR BOTH STANDARD AND SPECIAL CYLINDRICAL WORK.

grinding. While the machine is designed for standard cylindrical work, the headstock is so arranged that any special requirements can be easily accommodated. The machine has already proved its worth in the operation of grinding the large punches used in the manufacture of shrapnel and high explosive shell forgings. These punches range from 3 ins. to 6 ins. in diameter, and vary in length between two and five feet.

In grinding a shell forging punch, the threaded end and parallel part of the punch pass into the hollow spindle and are gripped in the chuck with the formed end out. This end is then ground with a wide form wheel exact to shape. The punch is next put on centres, the formed end running in a ball bearing cup centre. The "Form" wheel (on special wheel centre), is removed, and a 22 x 21 in. traverse wheel put on, the punch being then ground parallel as in a regular traverse grinder. Used-up punches can thus be kept in repair cheaply as annealing and rehardening are eliminated. The saving in this direction and in better forgings tends to quickly pay for the equipment. This work indicates the line of usefulness of

be arranged to suit any requirements desired, and is of extra rigid construction. Work is held by means of a universal chuck, together with a special interior centreing arrangement inside the hollow spindle. Numerous changes of speeds and feeds are provided, all levers relative to same, etc., being situated at front of machine within easy reach of operator. The wheels used are 22 ins. diameter, and of such width as may be required by the nature of work to be ground. A special truing device is rigidly attached to the machine table, making it an easy matter to keep the wheel in first class shape. Water is supplied to the wheel by a pump of ample capacity located at the rear of the machine, an unusually large tank cast on the grinder bed constituting the source of supply.

Careful attention has been paid to the wheel hood which is both convenient in service and also for changing wheels. The drive is self-contained, and the machine may be direct-connected to motor or lineshaft as required. The machine has a large capacity, swinging 18 ins. x 5 ft. between centres, with adjustment for taper grinding. Although simple in

## INTERNAL GRINDER FOR AUTOMOBILE CYLINDERS

THIS grinder has been developed to meet the demand of automobile manufacturers, high-class repair shops and service stations for an efficient and inexpensive method of grinding out automobile cylinders, and for various other internal grinding operations. It is a sturdy little tool and can be set up in any convenient part of the shop and connected to the nearest electric service lines, a vertical motor revolving

INTERNAL GRINDER FOR AUTOMOBILE CYLINDERS.

the grinding wheel and a horizontal motor operating the up and down movement of the wheel. The emery dust incident to grinding can either be sucked out the exhaust port of the cylinder by connecting to an exhaust fan, or be blown out by connecting a compressed air line to an attachment furnished with the grinder. The time required for grinding out a cylinder is a minimum as the cylinder can be quickly adjusted on the bed plate of the machine, the actual time for grinding depending of course on the condition of the cylinder and the amount of metal to be taken out.

The grinder consists of a vertical bar B with a circular rack. This is fed through a chain of gearing around and down at the same time, by the horizontal motor. Inside of the main bar B is a sleeve which contains the grinding spindle, and this sleeve is eccentric to the main bar, which permits grinding cylinders of different sizes.

Flexibly coupled to the grinding spindle is a vertical motor which revolves the grinding wheel A at high speed. The hand wheel H is for increasing or decreasing the throw of the grinding wheel for various sized bores, and for regulating the depth of cut to be made. At F provision is made for raising or lowering the main bar B by hand, while the shifting rod E can be thrown in or out for automatically feeding the main bar up or down. At I is a hand adjustment for revolving the main bar, while the screws J are for tilting the face plate C so that the cylinder can be placed in the proper angle for grinding.

The cylinder is placed on the face plate, but, before clamping down, a steel disc is substituted for the grinding wheel and the main bar is slowly revolved, the throw of the wheel being regulated by the hand wheel H until the cylinder centers itself. The face plate is then clamped tight to the bed D, and the cylinder in turn clamped tight to the face plate C. The steel disc is replaced by the emery wheel, and the vertical and horizontal motors are started by throwing the two switches placed on the machine; the depth of the grind is regulated by hand wheel H. The shifting rod E is next thrown in, automatically feeding the grinding wheel up through the cylinder. The whole operation of setting up and grinding is quickly accomplished.

The capacity of the machine is for cylinders from  $3\frac{1}{4}$  to  $5\frac{1}{2}$  ins. in diameter with a cut  $10\frac{1}{4}$  ins. long. Its height is 45 ins. from the floor line to top of bed plate and the floor space occupied only two feet square. The bed is 20 ins. long by 12 inches wide, and

the face plate, 15 ins. long by 12 ins. wide, carrying an elongated hole. The net weight is 400 pounds. The grinder is manufactured by the Renö-Kaetker Electric Co., Cincinnati, Ohio.

### DUPLEX HORIZONTAL DRILL

A DUPLEX horizontal drill in which provision is made to alter the separate spindle speeds as desired is shown in the accompanying photograph, the machine being a recent product of the Moline Tool Co., Moline, Ill. Both heads are gear driven from a central driving shaft extending the full length of the bed, various gear ratios for either head being available.

The bed is cast in the form of an oil tank with that portion of the top closed

DUPLEX HORIZONTAL DRILL.

which extends between the heads, thus insuring freedom from chip trouble. Three spindle speeds are obtained from the cone pulley, and each spindle has three changes of feed independent of the other. Following are the principal dimensions of the machine which is furnished complete with pump, tank, and piping: Length of bed, 7 ft.; distance between spindles, min., 4 in., max., 30 in.; spindles bored No. 4 Morse taper; height, bed to spindles, 6 in.; width of bed, 10 in.; belt capacity to pull up to 1 in. drills.

### RUSSIAN LANGUAGE FOR EXPORT TRADE

WHEN Principal Eldon, of the High School of Commerce, Toronto, asked the Board of Education recently, that classes in Russian might be started in his school, he was told to await further word from the Department, who had not yet given a definite decision to the motion on the part of the Board.

Already the University of Edinburgh has two lecturers in Russian, one a Russian born and the other a Scotsman. The Royal High School has a course in the language and about fifty students have

registered. Several manufacturing concerns have started night schools in Russian and have a large attendance. Two woolen mills in the south of Scotland have established night schools for the study of Russian.

United States Consul Fleming, at Edinburgh, in a report to the Bureau of Foreign and Domestic Commerce, says that the establishment of Russian classes in the Public Schools and other institutions in Scotland has been done on the recommendation of many Chambers of Commerce and other commercial institutions interested in the extension of foreign trade. He states that in Edinburgh there are now 168 young men studying Russian with a view to taking positions either under the Government or with private concerns for the purpose of pro-

moting trade with Russia after the war. The University of Toronto have taken steps to introduce a lectureship in Russian by the appointment of a committee who will make the necessary arrangements.

### THE BISHOP'S PREFERENCE

A YOUNG lady sat next to a distinguished bishop at a church dinner. Awed by the bishop's presence, she hesitated to speak to him, waiting for what she considered a favorable opportunity. Finally, seeing some bananas passed, she turned to him and said:—

"I beg your pardon, but are you fond of bananas?"

The bishop was slightly deaf, and leaning forward, replied:—

"What did you say?"

"Are you fond of bananas?" repeated the young lady, blushing.

The bishop thought for a moment, and then said:—

"If you want my honest opinion, I have always preferred the old-fashioned nightshirt."—Threads.

### PEACE TIME STEEL OUTLOOK

**T**WO weeks ago reference was made in our editorial columns to the probability of Great Britain being wholly independent of foreign steel by March, 1917. We now learn that both France and Germany are also so equipped as to ensure steel outputs largely in excess of their domestic requirements in the coming peace time, notwithstanding obviously necessary rebuilding and reconstruction demands by one at least of the two countries referred to. The fact that the former has already doubled her 1915 output, in spite of the past two year's occupation of much of her iron ore territory by Germany, is especially significant. Neglecting Belgium for the time being, as in her case the return to even her normal steel output is likely to be more or less delayed, we anticipate a merry scamper for post-war supremacy in the world's steel markets with Britain, France, the United States and Germany figuring as giant contestants.

A full appreciation of what such an eventuality will mean to Canada either with regard to projected export trade, or what is equally important, her domestic trade, has not as yet been fully, if at all realized. We are prone to assume that the belligerents have had their hands so full of fighting that, even with the provision of the where-withal to prosecute same in satisfactory measure, their steel production capacity has not been developed to such an abnormal extent as to give them individually a hitherto unparalleled preponderance in peace-time. The capacity of Canadian steel plants as a result of war munitions requirements has very materially increased comparatively, and the same may be said with respect to the steel enterprise of the United States. In neither case, however, has the development been such as to promote a comforting peace-time prospect; rather the reverse, we should say, judging from diagnosis of the outlook by interested and competent authorities in the latter country which have come to our notice.

With the merry scramble in the world's markets—offence and defence, the price toboggan of steel and steel products will get off to a good start, and, so far as Canada is concerned, it is to the defence feature against the coming scramble that provision and effort should more than the other be directed. Already in the United States where steel strength is many times our peer, defense views are finding expression, and little harm will be done but an immense service will be rendered to our not-distant future

commerce and industry, if earnest and timely cognizance be taken of the sure possibility of our being steel engulfed, unless definite action be planned to prevent it. The matter is of national moment.

### MODERN LANGUAGES AND EXPORT TRADE

**T**HE probability of reciprocal trade relations among the Allies being established and maintained for a time, at least, following the war, has directed attention to the subject of the acquirement by our youth in colleges, universities, etc., of an intelligent conversational grasp of one or more of the languages spoken in the different countries. Special activity is to be noted as regards acquirement of the Russian language, due of course to the greater business and commercial possibilities which Russia with her immense territory and its opportunity for development afford. It is self-evident that business worth the name can only be transacted when the accredited representative of a firm seeking to establish and build up trade relationships in a foreign country has the language of the latter at his tongue tip, so to speak, in the first instance. If he has this, a more or less brief association with his prospective clients usually suffices to become familiar with their whims and fancies, business methods and customs, etc.

Not only has the teaching of the Russian language been installed as a regular course in at least one university in Scotland, but we learn that in different industrial centres night school instruction in the same language has been started, with, in every case, a large attendance of students. The movement, as we understand it, has had its origination through the efforts of manufacturers with an eye to the establishment and development of Russian business in a business-like way. "The Lord helps those who help themselves," seems to have been their view of the situation, as against waiting for Governments to get busy, which they seldom do to the most effective purpose. We in Canada have had Russian trade opportunities—even dramatically on occasion, brought to our attention many times during these past war months. Unfortunately, however, the language feature was in large part obscured in the general display. Action is, however, being taken now regarding it, and there is evidence that with the opening of the New Year our principal universities and commercial colleges will be well started on the work of instruction. "Trade," we are wont to say, "follows the flag"; in this case, trade with our Allies may be said to be likely to follow acquirement of their language.

There is so much of novelty in this Russian language development that it is quite possible to overlook the claims and advantages derivable from a conversational and literary intimacy with that of France. It may be said that so far as Europe is concerned, whether from a business or social standpoint, intimacy with the French language is much more important than is Russian, the former being by habit and general consent the medium through which international transactions—business and otherwise, are conducted. For some reason or other, acquirement of even a conversational intimacy with the French language has given little evidence of keen desire on the part of our English-speaking citizens, in spite of the fact that both business and social opportunities for its exercise are unusually abundant. Even our Minister of Trade and Commerce at the recent Trade Conference of the Allies in Paris, was among the very few—two altogether, we think, for whose benefit the proceedings had to be translated into English. He is now a powerful pleader, recognizing his own shortcoming. If from the standpoint of business or otherwise the Russian language must be acquired, the other should under no circumstances be neglected.

## INDUSTRIAL NOTABILITIES

**W**ILLIAM STORRIE, A.M. Inst., C.E., chief engineer and director, John verMehr Engineering Co., Waterworks Engineers, 154 Simcoe Street, Toronto, was born at Paisley, Scotland, October 4, 1883, son of William and Jessie (Cochrane) Storrie. He was educated at John Nelson Institution, Paisley; Paisley Grammar School; Paisley Technical College; Glasgow and West of Scotland Technical College, and became articled pupil to James Lee, C.E., city engineer of Paisley, Scotland; being engaged chiefly on waterworks construction, from 1899 until 1907. He gained the Brough Scholarship in 1902, and the Glasgow Building Trades Exchange Prize in 1905.

WILLIAM STORRIE, A.M. Inst. C.E.

From 1907 to 1909 he was chief assistant to Messrs. Crouch & Hogg, Glasgow, Scotland, on waterworks, bridge, canal and harbor construction. Mr. Storrie came to Toronto in 1909, and was appointed resident engineer on construction of waterworks filtration plant of the City of Toronto, 1909-1912. He was waterworks engineer, City of Ottawa, 1912-1913; and became chief engineer, John verMehr Engineering Co. in 1913. This company designed and constructed the Ransome drifting sand water purification plant for the City of Toronto, this plant being the first of its kind in North America and the largest in the British Empire. Its total cost is \$1,100,000, and its capacity, 60,000,000 Imperial gallons per day. He served with the Queen's Own Royal Glasgow Imperial Yeomanry, from 1901 to 1908.

Mr. Storrie married Margaret Paterson Cowan, daughter of the late William H. Cowan, J.P., Hamilton, Scotland, January 30th, 1913; has one daughter. His clubs are: Engineers (Toronto); Associate Member, Institution of Civil Engineers, London, England; Associate Member, Canadian Society of Civil Engineers; Member of the American Waterworks Association. In religion he is Presbyterian. His residence is 17 Heath Street West, Toronto.

Prices Per Lb. Unless Otherwise Stated.

slight decline from that of the past few weeks. A \$2 decline is reported on furnace spot, the current quotation being \$6 per ton. Foundry grades are 50c easier, prompt being now quoted at \$9.50 per ton. The Pittsburgh quotations on Bessemer and open-hearth billets and sheet bars show another \$2.50 advance, the price being \$57.50. Heavy export business recently closed has materially aided the latest advance.

Plates are still in heavy demand, but mills are so crowded that consumers are unable to cover their requirements. Rails are very active. The recent demand for sheets has created a scarcity, more especially in galvanized and prices are again climbing. The heavy requirements for wire and wire products are keeping producers very active and a recent advance of \$5 per ton, Pittsburgh, on wire rods may mean a further rise on wire products. Inquiries for iron and steel bars are likewise heavy as reflected in a \$1 advance on iron bars, Chicago. Lap welded wrought iron pipe is hard to obtain and makers of boiler tubes are booked 6 to 8 months in advance. No local changes are effective this week, but dealers here look for an advance shortly.

## Metals

The feature of the metal markets has been the extraordinary developments in the copper situation, which is fast assuming a record position in the history of the industry. Tin retains its strong position and is slightly higher. Other metals are unchanged and prices are generally well maintained. Local dealers report good business in all metals, with copper especially active.

**Copper**—With the market taking on strength daily, and the continued demand for copper, which producers are unable to supply, it is anticipated that further advances will be featured shortly. The eagerness that some buyers are showing in their unsuccessful attempt to purchase metal is some indication of the actual state of the market, and the fact that many large producers are practically out of the market for the next six months give little prospect of relief for some time. London has recently reported a very active market and the latest quotations show an advance of over £10 in standard copper. New York is advancing, the latest quotations being 32½c for lake, 33c for electrolytic, 30½c for castings; these prices are 2¼, 1 and 1¼c respectively stronger than last week. Local dealers report a very active situation, and are quoting lake at 34c, electrolytic at 34c and castings at 33c; an advance on the week of 3c per lb.

**Tin**—The restrictions imposed on tin shipments by the British Government, have gradually depleted the available supply of metal in this country, and this

## The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents

**Montreal, Que., Nov. 20, 1916**—Industrial circles continue in a state of unabated activity, these conditions being featured by a constant advance in price of practically all materials which may be still further accentuated by the closing of navigation—the existing car shortage has already caused difficulties in transportation.

## Pig-Iron

The price of pig-iron continues upward, and still higher levels are reached this week. Advances quoted range from \$1 to \$2 per ton, Bessemer and grey forge, Pittsburgh, being among the latter. These are now quoted at \$29.95 and \$25.95 respectively.

## Steel

Price advances continue to feature the steel situation, and despite the fact that these prices have reached a record high, the outlook for the immediate future would indicate that the upward movement has not yet ceased, or even attained a position where the highest point can be foreseen. Production is proceeding at an unprecedented rate, yet the demands of consumers are far greater than the mills can supply. This abnormal activity is expected to continue throughout the whole of next year or even longer, should the war continue. All raw and semi-finished material is constantly advancing, the exception being in coke, which shows a

scarcity is causing some anxiety in trade circles. It is expected that the situation will shortly be relieved by the freer granting of permits, in order to keep the trade supplied with sufficient metal to meet requirements. An advance of over £4 is reported from London and New York quotations show an advance of  $1\frac{3}{4}$ c per pound, the nominal price being now 45c. The situation here is practically unchanged, but dealers have advanced prices one cent per lb., now quoting at 46c.

**Spelter**—The present strength of the market is entirely due to the action of the producers in refusing to sell except on small lot orders. With the export business much lighter and home consumers taking very little interest in the situation, it was expected that prices would become easier. New York reports an advance of  $\frac{3}{4}$ c, the current quotation being nominally  $12\frac{1}{4}$ c per lb. The local situation is unchanged and prices are firm at 14c per pound.

**Lead**—The market is very steady and prices are firm. Demand is not active, but conditions point to continued strength. The trust price remains firm at 7c, with outside quotations slightly in advance. Conditions here are strong at 9c.

**Antimony**—The market is steady and strong, with slight advance in price quotation, New York being  $\frac{1}{4}$ c higher at  $13\frac{1}{4}$ c per pound. Dealers here are quoting 15c on a steady and unchanged market.

**Aluminum**—No change is reported in the market and prices are firm at 70c per pound.

### Machine Tools and Supplies

An improved demand for the heavier machinery has developed additional activity in machine tool circles. While much of this business has been for shell-making purposes, the inquiries for lighter equipment has been quite general. The total volume of business is not large, but sufficient is passing to keep tool manufacturers actively employed. Deliveries are better, but on certain machinery, such as the better type of tool room equipment, shipments are extended for some months. Supplies are in good demand with prices very firm, some showing higher tendencies.

### Scrap

The conditions prevailing in the old metal market continue to improve and prices are keeping pace with the advances quoted in other lines of industrial activity. Demands for all kinds of scrap are heavy, more especially copper and heavy melting steel. Dealers here report a very active market with a  $1\frac{1}{2}$ c advance on all old coppers, with the exception of wire, which is one cent higher, the quotations ranging from  $21\frac{1}{2}$ c for

light to  $24\frac{1}{2}$ c for heavy and crucible copper. Heavy melting steel is  $\frac{1}{2}$ c higher, being quoted at  $11\frac{1}{2}$ c per pound.

**Toronto, Ont., 21.**—The strike of the C.P.R. freight handlers has intensified an already acute situation, and the local freight yards are more congested than ever. Relief has been promised by bringing in help from outside points, but merchants are suffering serious inconvenience in the meantime. Trade all over the country continues good and most industries are deriving considerable benefit, either directly or indirectly, from the large orders for war supplies that are being placed from time to time. The volume of production is however, being restricted by the scarcity and high cost of raw materials, and also by the inadequacy of the supply of labor and its impaired efficiency. In neither case can the situation be improved to any great extent under prevailing con-

### CANADIAN GOVERNMENT PURCHASING COMMISSION

The following gentlemen constitute the Commission appointed to make all purchases under the Dominion \$100,000,000 war appropriation:—George F. Galt, Winnipeg; Hormidas Laporte, Montreal; A. E. Kemp, Toronto. Thomas Hilliard is secretary, and the Commission headquarters are at Ottawa.

ditions. Wages are also higher which further tends to increase cost of production. The bulk of the trade being for export naturally increased the volume of that business, this being clearly shown in the returns issued by the Dominion Government. For the months of October, the exports of manufactured goods were valued at \$28,637,814 as against \$12,880,731 for the corresponding month last year.

### Steel

The steel market continues remarkably active and prices are still advancing. The mills are unable to meet the enormous demand for steel owing to their limited capacity, which although it has been considerably increased, is not sufficient to take care of all the offerings. Scarcity of fuel and labor is also tending to restrict output. The shortage of steel is becoming more acute and deliveries are more backward than ever. The wrought pipe market is stronger and prices have advanced owing to the increase in cost of raw materials and production. The advance has affected both lapweld and butt weld pipe. Makers of plates have announced another advance,  $\frac{1}{2}$  inch and larger be-

ing now quoted locally at 5c, while heads and tank plates  $\frac{1}{4}$  inch are now  $5\frac{1}{4}$ c per pound, delivery at mill convenience. Large orders for ship plates are being placed at high prices, premiums being paid for quick delivery. There seems to be practically no limit to the tonnages of plates that many buyers are seeking, or the prices they are willing to pay for desired deliveries. Local warehouse prices on steel bars have advanced to 3.65c, while a further advance in mill prices on the same material is looked for in the near future. Higher prices on tubes are expected about the end of this month while manufacturers predict that prices of rivets will also be put up at an early date. Cut nails have advanced 30c, being now quoted at \$4 per 100 lbs. Coach and leg screws, plate washers, machine bolts, black bolts, and bolt ends, have all advanced about 10 per cent.

The market for sheets is very strong and higher prices are expected, particularly on light gauge black and on galvanized sheets. Manufacturers of sheets are withdrawing from the market, many mills refusing to quote on further inquiries. Production, while at a high rate, is not heavy enough to take care of accumulated tonnages, and practically all mills will carry over into next year a large tonnage of present quarter business. Back and galvanized sheets have gone up \$3 per ton in the States.

In the United States, the market is very firm and the upward tendency in prices is very much in evidence. An advance of \$5 per ton in rail prices has been announced by the U.S. Steel Corporation, applying to all deliveries; Bessemer rails are now \$38, and open-hearth rails \$40 per ton, mill. The export business continues very heavy. Recent orders from the Allies include 250,000 tons of shell steel for Great Britain and France; 20,000 tons of soft steel billets for Great Britain; 30,000 tons of wire for France, while a Canadian car works has just placed an order for 15,000 tons of plates and shapes in Eastern Pennsylvania.

### Pig Iron

Prices of domestic pig iron have made a further advance of \$1 per ton, Hamilton and Victoria being now quoted at \$32 per ton. In the States the market is advancing and new high levels have been reached. Grey forge, Pittsburgh is now quoted at \$25.45; Bessemer \$30.95; and basic, \$25.95 per ton Pittsburgh, Lake Superior charcoal pig iron is now \$26.25 per ton Chicago. The furnaces in Buffalo are in a sold-up condition, all producers reporting that they are oversold.

### Machine Tools

The machine tool market continues active and the situation generally very much as reported last week. Tentative inquiries have been received by local machinery houses for tools for the new type 18 pounder high explosive shell. The new type has a different style of nose, a bigger bore and thinner walls. It is not unlike the Russian shell of similar calibre. There is also a demand for tools for the new mark III. 6 in. shell, while 4.5 in. plants are also being changed over to suit the new type of shell of that calibre. The demand for machine tools for making fuse parts is quieter, buyers having to a large extent satisfied their requirements meantime. There is still a tendency toward higher prices for most types of machine tools. Prices on high-speed drill presses have advanced  $12\frac{1}{2}$  per cent. recently, making quotations in these tools about 25 per cent. higher than they were two years ago. Prices on ordinary upright drill presses also have advanced 10 per cent., making present quotations about 25 per cent. higher than they were two years ago. Prices on ordinary upright drill presses also have advanced 10 per cent., making present quotations about 25 per cent. higher than they were two years ago.

### Supplies

The revised standard lathe chuck list has been issued, and adopted by all makers who are also using the same discounts. Prices on the new list are practically double those on the old lists, but the extras have been reduced to list plus 15 per cent. The new price is list plus 15 per cent., while the old price was list plus 40 per cent. Canadian crude oil has advanced 5c making the present price \$1.88 per barrel. This indicates that higher price for gasoline may be expected. Active business is reported by local supply houses with a general tendency towards higher prices particularly for iron, steel, and brass goods.

### Metals

The outstanding feature in the metal markets this week is a sharp advance in local prices of copper following a similar movement in New York. It is being realized that the copper production in the States has been sold out for the first half of 1917; the position of this metal is thus an exceptionally strong one. Tin is also higher, due to a rather tight spot market in New York. Spelter is in good demand at unchanged prices, while lead is also unchanged and firm. Antimony and aluminum are quiet and unchanged. Higher prices on solders have been announced.

**Copper.**—The continued active demand for copper combined with the growing scarcity of this metal, has had a marked

effect on prices. Some producers are sold out for the entire first half of next year. The demand, both export and domestic, is enormous, and there is no relief in sight, indications pointing to a more acute situation, as there does not appear to be sufficient copper being produced to satisfy the world's requirements. Copper has advanced 3c locally, electrolytic and lake being quoted at 34c, and castings at 33c per pound.

**Tin.**—The demand for tin is heavier, due, it is thought, to the fear that stocks on hand in the States may become reduced owing to the increased difficulty in obtaining permits for exporting metal from England. The market is thus excited and quotations higher. Tin has advanced 2c locally, and is now quoted at 48c per pound.

**Spelter.**—The output of spelter is well sold ahead, and there is some scarcity of spot metal. The market continues firm, with spelter in good demand, particularly from the brass mills. Local price, 14c per pound.

**Lead.**—The market is steady and unchanged. The trust continues to quote 7c New York, but independents are asking 7.05c to 7.10c for December lead. In London the situation remains unchanged. Local price firm at 9c per pound.

**Antimony.**—The market is easier and demand very quiet. Local price, 10c per pound.

**Aluminum.**—The market is quiet, with a weaker tendency. Local price, 68c per pound.

**Solders.**—Prices are higher following the advance in tin. Solders have advanced  $1\frac{1}{2}$ c per pound, guaranteed being quoted at  $31\frac{1}{2}$ c and strictly at  $29\frac{1}{2}$ c per pound.

### POST-WAR TRADE POSSIBILITIES

FRANK BAILEY, in his presidential address to the Association of Engineers-in-Charge, reviewing after-war possibilities, said:—"Our workshops and factories (now in many cases efficient arsenals) ought to be filled with orders ready for execution when all munitions requirements are fulfilled. Stocks of all kinds require replenishing, and great markets will shortly be open for our goods in the countries of our Allies, and in all parts of the world where Hun atrocities have created a welcome for the trade of an honest country. We now see signs in every direction that the stress, anxieties, and tragedies of war have roused Britain to throw off all allegiance to tradition, and to cease to cling to ideas which seemed to be part of an unalterable limitation. The awakening has arrived, and we are now ready to adopt innovations, laws, systems, and methods which had no chance of receiving intelligent consideration in former times. Progress and necessity call for combination, co-operation, con-

centration, and efficiency. Individualism is gradually disappearing; the family concern, founded probably by the grandfather and handed down from son to son, has outgrown its limits of administration, or shrunk to ineptitude; many private banks have been merged into the great joint stock banks, and business generally is more a contest of efficiency than part of a personal greeting of friends, or a recreation."

### CHEAPER PAPER DOUBTFUL

PRACTICALLY no hope is held out by the experts of the Federal Trade Commission for lower prices for print paper, and their intimation is that prices are apt to advance rather than decline. The Commission this week will set a date for a hearing on the subject at which representatives of newspapers and other publications, as well as representatives of the paper manufacturers, will appear to present their cases.

For several months the Commission has been investigating the causes of the enormous rise in the price of print paper, but its findings have not been made public and will not be until the hearing has been held. When it started out the Commission felt that perhaps prices were being juggled by the manufacturers, but it is understood that its investigations showed that conditions on this continent and abroad were such as to force a tremendous rise in many of the materials used in the manufacture of print paper and paper manufacturers are confidently predicting that they will be absolved from all blame for the rise.

Conditions in Canada have a strong bearing on the question, as the amount of news print paper imported equals about one-third of the domestic production, and most of the imported paper comes from Canada. The paper trade claims that costs are bound to increase in the future because of the scarcity of labor in the Canadian woods and the consequent increase in the labor of bringing logs to the mills.

The newspapers of Washington are so alarmed over the situation that they have organized paper saving campaigns all over the city. The merchants are being urged to use as little wrapping paper as possible, while school children are bringing bundles of old newspapers to school every day, the proceeds from the sale of which go toward the improvements of the municipal playgrounds.

**Dominion Machinery Co.,** Toronto, Ont., have taken out a permit to erect a modern warehouse at 14 Darling Ave., at a cost of \$5000. They will carry a full line of shell machinery, machine tools, both new and second-hand. Office address is 110 Church Street, Stevenston Building, Toronto.

## Enlarged Canadian Trade Intelligence Service

Under the arrangement made by the Minister of Trade and Commerce with Sir Edward Grey in July, 1912, the Department of Trade and Commerce, Ottawa, is able to present the following list of the more important British Consulates whose officers have been instructed by the Foreign Office to answer inquiries from and give information to Canadians who wish to consult them in reference to trade matters.

<b>BRAZIL</b> Bahia, British Consul. Rio de Janeiro, British Consul General.	<b>ITALY</b> Genoa, British Consul General. Milan, British Consul.	<b>RUSSIA</b> Moscow, British Consul General. Petrograd, British Consul. Vladivostok, British Consul. Odessa, British Consul General.
<b>CHILE</b> Valparaiso, British Consul General.	<b>MEXICO</b> Mexico, British Consul General.	<b>SPAIN</b> Barcelona, British Consul General. Madrid, British Consul.
<b>COLOMBIA</b> Bagota, British Consul General.	<b>NETHERLANDS</b> Amsterdam, British Consul.	<b>SWEDEN</b> Stockholm, British Consul.
<b>ECUADOR</b> Quito, British Consul General. Guayaquil, British Consul.	<b>PANAMA</b> Colon, British Consul. Panama, British Vice-Consul.	<b>SWITZERLAND</b> Geneva, British Consul.
<b>EGYPT</b> Alexandria, British Consul General.	<b>PERU</b> Lima, British Vice-Consul.	<b>URUGUAY</b> Monte Video, British Vice-Consul.
<b>FRANCE</b> Havre, British Consul General. Marseilles, British Consul General.	<b>PORTUGAL</b> Lisbon, British Consul.	<b>VENEZUELA</b> Caracas, British Vice-Consul.
<b>INDIA</b> Calcutta, Director General of Commercial Intelligence.		

## CANADIAN COMMERCIAL INTELLIGENCE SERVICE

The Department of Trade and Commerce invites correspondence from Canadian exporters or importers upon all trade matters. Canadian Trade Commissioners and Commercial Agents should be kept supplied with catalogues, price lists, discount rates, etc., and the names and addresses of trade representatives by Canadian exporters. Catalogues should state whether prices are at factory point, f.o.b. at port of shipment, or, which is preferable, c.i.f. at foreign port.

### CANADIAN TRADE COMMISSIONERS.

<b>ARGENTINE REPUBLIC</b> H. R. Poussette, Reconquista, No. 46, Buenos Aires. Cable address, Canadian.	<b>NEWFOUNDLAND</b> W. B. Nicholson, Bank of Montreal Building, Water Street, St. John's. Cable address, Canadian.
<b>AUSTRALIA</b> J. H. Ross, Stock Exchange Building, Melbourne. Cable address, Canadian.	<b>NEW ZEALAND</b> W. A. Beddoe, Union Buildings, Customs Street, Auckland. Cable address, Canadian.
<b>BRITISH WEST INDIES</b> E. H. S. Flood, Bridgetown, Barbadoes, agent also for the Bermudas and British Guiana. Cable address, Canadian.	<b>SOUTH AFRICA</b> W. J. Egan, Norwich Union Buildings, Cape Town. Cable address, Cantracom.
<b>CHINA</b> J. W. Ross, 13 Nanking Road, Shanghai. Cable address, Cancoma.	<b>UNITED KINGDOM</b> Harrison Watson, 73 Basinghall Street, London, E.C., England. Cable address, Sleighing, London.
<b>CUBA</b> Acting Trade Commissioner, Lonja del Comercio. Apartado 1290, Havana. Cable address, Cantracom.	<b>N. D. Johnston, Sun Building, Clare Street, Bristol. Cable address, Canadian.</b>
<b>FRANCE</b> Phillipe Roy, Commissioner General, 17 and 19 Boulevard des Capucines, Paris. Cable address, Stadacona.	<b>J. E. Ray, Central House, Birmingham. Cable address, Canadian.</b>
<b>JAPAN</b> G. B. Johnson, P. O. Box 109, Yokohama. Cable address, Canadian.	<b>J. Forsyth Smith, 27-28 Pearl Building, East Parade, Leeds. Cable address, Canadian.</b>
<b>HOLLAND</b> Acting Trade Commissioner, Zuiddlaak, 26, Rotterdam. Cable address, Watermill.	<b>F. A. C. Bickerdike, Canada Chambers, 36 Spring Gardens, Manchester. Cable address, Cantracom.</b>
<b>RUSSIA</b> C. F. Just, Canadian Government Commercial Agent, Alexandriyskaya, Ploshch 9, Petrograd.	<b>J. T. Lithgow, 87 Union Street, Glasgow, Scotland. Cable address, Contracom.</b>
<b>L. D. Wilgress, Canadian Government Commercial Agent, Bukhgozla Ulitza No. 4, Omsk, Siberia.</b>	

### SPECIAL TRADE COMMISSIONER—LUMBER

H. R. McMillan, visiting Europe, Africa, Australasia and the Orient.

### CANADIAN COMMERCIAL AGENTS

AUSTRALIA, B. Millin, Sydney, N.S.W.

**BRITISH WEST INDIES**  
Edgar Tripp, Port of Spain, Trinidad. Cable address, Canadian.  
R. H. Curry, Nassau, Bahamas.

**NORWAY AND DENMARK.**

### CANADIAN HIGH COMMISSIONER'S OFFICE

#### UNITED KINGDOM

W. L. Griffith, Secretary, 17 Victoria Street, London, S.W., England.  
Cable address, Doulinion, London.

# INDUSTRIAL <sup>AND</sup> CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News

## Engineering

**Guelph, Ont.**—The Guelph Stove Co. will build a new foundry.

**Winnipeg, Man.**—The Breen Motor Co., is erecting a garage to cost \$35,000.

**Hamilton, Ont.**—The Dominion Steel Castings Co. will build an extension to their plant.

**St. Catharines, Ont.**—The Metal Drawing Co. will build an addition to their machine shop.

**Copper Cliff, Ont.**—The Canadian Copper Co., contemplate extending their plant here.

**Kinmount, Ont.**—H. Deltman is in the market for a 60-h.p. engine and 75-h.p. boiler for a sawmill.

**Toronto, Ont.**—The Canadian Carbon Co., will erect a three-story factory on Paton Road, to cost \$23,400.

**Toronto, Ont.**—W. H. Banfield & Son have commenced the erection of a factory, estimated to cost \$10,000.

**London, Ont.**—The McLaughlin Motor Car Co., will erect an addition to its plant on Richmond Street, to cost \$6,500.

**Trail, B.C.**—It is proposed to make extensive improvements to the city lighting and power system that will cost about \$25,000.

**Guelph, Ont.**—Work will be commenced at an early date on the erection of an addition to the Loudon Machinery Co., plant to cost \$6,000.

**Hamilton, Ont.**—The W. T. Rawleigh Co., of Freeport, Ill., has purchased a site in the east end and purpose building a \$100,000 factory next year.

**Toronto, Ont.**—The Canadian Fairbanks-Morse Co., will build an extension to their plant on Bloor street to cost \$2,500. A permit has been granted.

**Toronto, Ont.**—The American La France Fire Engine Co., will erect an addition to its plant at Western Avenue, and Weston Road, to cost \$6,000.

**Montreal, Que.**—Plans have been perfected for increasing the output of the St. Lawrence Pulp & Lumber Corporation to 75,000 tons annually, against present capacity of 37,500 tons of sulphite pulp annually.

**Winnipeg, Man.**—The Willys-Overland Co., has commenced the erection of a reinforced concrete and brick garage on Portage Avenue to cost \$60,000.

**Hamilton, Ont.**—The Standard Underground Cable Co. will make an addition to their plant to cost \$30,000. Prack & Perrine, Toronto, are the architects.

**Sarnia, Ont.**—The Mueller Manufacturing Co. of this city is considering the installation of a private fire-fighting apparatus similar to the one now existing at the Imperial Oil Co.

**Toronto, Ont.**—Tenders are being received for an addition to the plant of the Booth-Coulter Copper & Brass Co., 115 Sumach Street, to cost \$5,000. Bond & Smith, 15 Wilton Avenue, Toronto, are the architects.

**Chicoutimi, Que.**—The Chicoutimi Pulp Co. will increase its pulp mill capacity to 130,000 tons annually, compared with present output of 80,000 tons of mechanical pulp. This mill is claimed to be the largest exporter of mechanical pulp on this continent.

**Quatsino Sound, B.C.**—The Colonial Pulp & Paper Mills, Ltd., will erect a sulphite mill with a capacity of 120 tons a day. The first unit will have a capacity of 60 tons. It is expected that the plant will be completed in about a year.

**Cochrane, Ont.**—The Frederickhouse & Abitibi Pulp Wood Co., now being organized here, proposes to build saw mills and a wood-working plant at a cost of \$150,000 and later to erect a rosser plant. J. A. McAndrews, Lumsden Building, Toronto, is interested.

**Prince Rupert, B.C.**—The bonding of the Dunsmuir mineral holdings on the Hoestahl River, near Port Essington, by E. Hinman, representing New York interests, is regarded here with a good deal of interest, for the transaction may foreshadow the construction of a smelter which would be of vast importance to the business life of this city.

**Windsor, Ont.**—The Sterns Tire and Tube Co., of Canada, has announced that it would build a plant in Windsor for the manufacture of a new kind of automobile tire invented and placed on the market by Edward Sterne, of St. Louis, Mo. The factory will be built on Howard Avenue. The property which the company will buy comprises three acres. It has an authorized capital of \$1,000,000.

**Whitby, Ont.**—The Town Council has decided to submit a by-law to the ratepayers providing for the guarantee by the town of bonds to the extent of \$100,000 for the proposed new tractor industry to be located here. The company it is understood, will erect a \$200,000 plant, if the by-law carries.

**Montreal Aqueduct Scheme.**—A committee appointed by the ratepaying engineers of the city of Montreal to investigate an ambitious aqueduct scheme to supply the city with water and power from the St. Lawrence River, and to cost \$10,000,000, has pronounced it a failure. The sum of \$5,200,000 has already been spent on the aqueduct, and this is regarded by the engineers as wasted. The city is warned that if the remainder of the money called for by the scheme is spent it too will be wasted. The engineers find that the city entered upon the operations without sufficient study.

## Municipal

**Walkerton, Ont.**—A hydro by-law will probably be voted on at the January elections.

**Three Rivers, Que.**—The City Council contemplate extending the waterworks system.

**Penticton, B.C.**—The Town Council have decided to purchase an engine for the electric light station.

**Levis, Que.**—The Town Council propose installing a filtration plant at an estimated cost of \$45,000. Quimet & Lepage, of Montreal, are the engineers.

**Sault Ste. Marie, Ont.**—The City Council contemplate the purchase of two motor-driven pumps of a capacity of 5,000,000 imperial gallons per 24 hours each.

**Hamilton, Ont.**—A by-law will be submitted to the ratepayers in January to sanction the expenditure of \$275,000 on a steam turbine driven pump as an auxiliary for the waterworks system.

**Hamilton, Ont.**—The proposed reservoir, if constructed, will cost about \$500,000. City Engineer Gray and Hydro Engineer Sifton have practically completed their joint report on specifications and estimates for the twenty million gallon reservoir. An alternative scheme is a steam pumping plant.

## Whelan Hammer Nosing Apparatus

4.5"      60 Pounders      6" H.E.

**T**HE Whelan Nose Apparatus has been designed with the sole object of giving an absolutely uniform and concentric nose, and at the same time of leaving the inside radius true with the main body of the shell. The shell is held at the base by means of a Collet Chuck, and is revolved by a reversing air motor, which is also used to open and close the chuck.

The carriage travels on plain gibbed ways, and is fed up to the hammer by means of the large pilot wheel geared 3 to 1 into rack on carriage.

The frame is of steel sections, the ways also are of machinery steel, accurately planed.

Our confidence in this apparatus is

justified because in one shop has nosed over 35,000 shells without a spoil or a breakdown.

This method eliminates inside profiling, and the nose of the shell after coming from the hammer, when put in a lathe, runs just as true as the body.

The **WILLIAMS** Machinery  
A. R. Co., Limited

66 Front St. W.

Toronto

**INDUSTRIAL CARS, FLOOR-  
TRUCKS, PORTABLE STEEL  
TRACK, TURNABLES.**
